This manual is to be given to the end user.

Pjs
Servo gearboxes
Installation and maintenance
NOTE

LEROY-SOMER reserves the right to modify the characteristics of its products at any time in order to incorporate the lastest technological developments. The information contained in this document may therefore be changed without notice.
LEROY-SOMER gives no contractual guarantee whatsoever concerning the information published in this document and cannot be held responsible for any errors it may contain, nor for any damage resulting from its use.

CAUTION

Throughout the manual, this symbol warns of consequences which may arise from inappropriate use of the servo gearbox Pjs since risks may lead to material or physical damage.

Despite all the care taken in the manufacture and checking of this equipment, LEROY-SOMER cannot guarantee that lubricant will not escape during the product’s lifetime. If slight leaks could have serious consequences for the safety of people and property, the installer and user should take all necessary precautions to avoid such consequences.

3 - LUBRICATION .................................................................................................................................................... 7
  3.1 - maintenance, draining ................................................................................................................................. 7
  3.2 - plugs position ............................................................................................................................................... 7
  3.3 - oil capacity .................................................................................................................................................. 7

4 - TECHNICAL CHARACTERISTICS .................................................................................................................. 8

5 - INSTRUCTIONS FOR DISMANTLING AND REBUILDING ................................................................. 8
  5.1 - dismantling ............................................................................................................................................... 8
  5.2 - rebuilding .................................................................................................................................................. 8
1 - STORAGE

Pjs servo gearboxes can be stored horizontally in a dry place at a temperature between 0° and 30°C in their original packaging (for a maximum of one year). (Unpainted machined parts are protected with grease).

This manual contains important information concerning maintenance. This information must be observed to ensure technical performance and compliance with the conditions of the warranty.

2 - INSTALLATION RECOMMENDATIONS

Servo gearbox:
For the installation of Pjs servo gearbox, follow the "Recommendations" chapter in the general manual (ref. 2557). Unpack the unit, remove the protection devices and clean the shaft. The servo gearbox must be assembled on its holder without placing stress upon the housing. 12.9 screws must be used to secure the gearbox to the machine (see screw tightening torque in the table below). Pinions or pulleys must be mounted without any impact on the output shaft. Only use appropriate tools.

Servo motor:
For connection of the complete drive system (with brake), follow the instructions of corresponding maintenance delivered with the goods in the parcel.

3 - LUBRICATION

For operation in ambient temperature from -20°C to +50°C and a servo gearbox housing temperature of 90°C, Pjs servo gearbox is delivered, as standard, lubricated with a synthetic oil with 220 cst viscosity at 40°C.

You must use an oil of the recommended type. Please observe the oil quantities specified in the table (section 3.3). (Magnetic plugs make filling, pressure relieving and draining easier, and retain any metallic particles)

POLYGLYCOL LUBRICANTS CANNOT BE MIXED WITH MINERAL OR SYNTHETIC LUBRICANTS OF A DIFFERENT TYPE.

3.1 - Maintenance, draining

Draining should preferably be carried out every 10,000 hours. For harsh applications, please consult Leroy-Somer. Observe the recommended draining intervals and oil quantities.
- Drain the servo gearbox while warm (after 15 to 30 minutes of operation) via the lower plug by loosening the upper plug to facilitate the flow.
- Close the drain plug.
- Rinse the servo gearbox by maintaining the same quantity of oil and operating the servo gearbox for a few minutes in each direction of rotation.

- After redraining, refill the oil taking care to seal the various plugs (Loctite 573, for example).

3.2 - Plugs position

a - Servo gearboxes have an upper plug for refilling and a lower plug for draining. The position of these plugs depends on the operating position of the servo gearbox, which must be specified at the time of ordering.
b - For continuous operation at rated speed, the optional breather plug must be installed. After installing the servo gearbox on site, insert the breather plug in the place of the fill plug.

3.3 - Oil capacity (cm³)

The volumes of oil required (these vary depending on the operating position of the servo gearbox, which must be specified at the time of ordering) are indicated in the table below:

The oils in the table below can also be used.

4 - TECHNICAL CHARACTERISTICS

Necessary information

a) from the servo gearbox nameplate :
1- servo gearbox model and size
2- operating position
3- fixing form : BS
4- exact reduction
5- output speed (min⁻¹)
6- backlash : MEDIUM
7- serial number
8- lubrication

b) Where a servo motor is fitted to the servo gearbox, from the servo motor nameplate :
(for the servo motor : see the corresponding manual)
- servo motor type, example : 95UMB300CACAA

5 - INSTRUCTIONS FOR DISMANTLING AND REBUILDING

Only use appropriate tools (adequately-sized torque wrenches, calibrated screwdrivers, etc.) or contact a service centre (see back of servo motor manual) or a Leroy-Somer approved centre.

Contact one of the centres to ensure the original standard of the product is maintained.

Pjs
Servo gearboxes

5.1 - Dismantling

- Uncouple the servo gearbox from the machine.
- Remove the servo motor.
- Dismantle the servo gearbox.

5.2 - Rebuilding

- Proceed in the reverse order to dismantling.
- The servo gearbox has a slotted ring coupling. The coupling bore is adapted to the servo motor shaft.
- The servo motor is positioned in relation to the servo gearbox by the shaft and not by the centring of the flange.
- If the servo motor shaft is keyed, remove the key and check that there is no burr on the groove.
- Degrease the servo motor shaft, the sleeve bore and the mating surface of the flange.
- Position the slotted ring coupling so that the locking screws can be accessed via the appropriate openings in the housing.
- If possible, assemble in a vertical position with the servo motor above.
- Enable access to the coupling screws. Bring into contact the two coupling screws and gradually tighten them one after the other (3 steps, minimum) until the tightening torques indicated in the table below are reached.
- Prevent access to the screws using plastic plugs.
