Parameter mm.000

Parameter mm.000 (mm.000) is one parameter that can be accessed from every drive menu so that the user can initiate various actions by setting a value in this parameter and then performing a drive reset. If the action is completed successfully parameter mm.000 is cleared when the action is complete. If the action is not started because the value does not correspond to an action, or because the action is not allowed (i.e. an attempt is made to load defaults and the drive is enabled), parameter mm.000 is not cleared. If the action is started and then fails a trip is produced and parameter mm.000 is not cleared.

There could be some conflict between the actions of *Parameter mm.000* (mm.000) and *Parameter Cloning* (11.042) when the drive is reset. If *Parameter Cloning* (11.042) has a value of 1 or 2 and a valid action is required from the value of parameter mm.000 then only the action required by parameter mm.000 is performed, but on successful completion of the action both parameters are cleared. If *Parameter Cloning* (11.042) has any other value it is not affected.

The table below shows the possible actions that can be initiated with *Parameter mm.000* (mm.000).

Parameter mm.000 (mm.000) value	Action	Possible failures
1000	Save drive user save parameters to non-volatile memory. Power-down save parameters are saved when the drive enters the under voltage state.	No action if the drive is in the under voltage state (i.e. <i>Under Voltage Active</i> (10.016)), or <i>Low Under Voltage Threshold Select</i> (06.067) = 1 or <i>Backup Supply Mode Enable</i> (06.068) = 1 or <i>User Supply Select</i> (06.072).
1001	Save drive parameters to non-volatile memory. It should be noted that power-down save parameters are also saved which will result in one background task scan being extended to 100ms.	
1070	Reset all option modules	
1233	Load 50Hz defaults	No action if the drive is enabled
1234	Load 50Hz defaults to all menus except option module menus (i.e 15 to 20 and 24 to 28)	No action if the drive is enabled
1244	Load 60Hz defaults	No action if the drive is enabled
1245	Load 60Hz defaults to all menus except option module menus (i.e 15 to 20 and 24 to 28)	No action if the drive is enabled
1253	Change drive mode and load 50Hz defaults	No action if the drive is enabled
1254	Change drive mode and load 60Hz defaults	No action if the drive is enabled
1255	Change drive mode and load 50Hz defaults except for menus 15 to 20 and 24 to 28	No action if the drive is enabled
1256	Change drive mode and load 60Hz defaults except for menus 15 to 20 and 24 to 28	No action if the drive is enabled
1299	Reset <i>Stored HF</i> trip.	
2001	Create a boot file on a non-volatile media card based on the present drive parameters including all Menu 20 parameters	Non-volatile media card trips
4xxx	NV media card: Transfer the drive parameters to parameter file xxx	Non-volatile media card trips
5xxx	NV media card: Transfer the onboard user program to onboard user program file xxx	Non-volatile media card trips
6xxx	NV media card: Load the drive parameters from parameter file xxx or the onboard user program from onboard user program file xxx	No action if the drive is enabled Non-volatile media card trips
7xxx	NV media card: Erase file xxx	Non-volatile media card trips
8xxx	NV Media card: Compare the data in the drive with file xxx	Non-volatile media card trips
9555	NV media card: Clear the warning suppression flag	Non-volatile media card trips
9666	NV media card: Set the warning suppression flag	Non-volatile media card trips
9777	NV media card: Clear the read-only flag	Non-volatile media card trips
9888	NV media card: Set the read-only flag	Non-volatile media card trips
9999	NV media card: Erase and format the NV media card	Non-volatile media card trips
110SI	Transfer electronic nameplate data from an encoder into drive parameters. I is the interface: 1=P1 position feedback interface, 2=P2 position feedback interface. S is the source: 0=drive, 1=Option Slot 1, ... 4=Option Slot 4.	If a drive interface is selected (i.e. S = 0): <ul style="list-style-type: none"> If a suitable feedback device is not available then parameter zero will remain at the value set and no action will be taken. If the device does not respond, or there is a comms error or the CRC of the nameplate data is incorrect then a trip is initiated. If an option module interface is selected (i.e. S = 1, 2, 3 or 4): <ul style="list-style-type: none"> If the selected option module is not present or does not support the electronic nameplate function then the system will time out and initiate a trip. If the device does not respond, or there is a comms error or the CRC of the nameplate data is incorrect then a trip is initiated. See <i>Name Plate</i> for more details on the trips.
12000	Only display parameters that are different from their default value. This action does not require a drive reset.	
12001	Only display parameters that are used to set-up destinations (i.e. DE format bit is 1). This action does not require a drive reset.	
59999	Deletes an onboard user program if a program is present. Note: Any parameter changes that have not been saved will be lost during this action.	No action if the drive is enabled. No action if there is no program present. No action if the user program is enabled (i.e. <i>Onboard User Program: Enable</i> (11.047) = 1)
40xxx	If xxx is between 001 and 999 the system is cloned on to an SD card if fitted. This system has been partially implemented, so initiating this process creates the back-up structure on the SD card but does not copy any drive or option module data. Future development is required to complete this function.	No action if the drive is enabled. The drive will trip if the requested back-up data already exists or an option module does not respond correctly during the process.

60xxx	If xxx is between 001 and 999 the system is cloned from an SD card if fitted. This system has not been implemented, but parameter mm.000 is reset if a value between 60001 and 60999 is entered and the drive is reset. Future development is required to complete this function.	No action if the drive is enabled.
-------	--	------------------------------------

Parameter mm.000 (mm.000) values from 1 to 14 are equivalent to other values as shown in the table below to allow easy access to some commonly used functions. For 0 and each of these values the keypad provides a string as shown.

Value	String	Equivalent value	Action
0	[No Action]	0	
1	[Save parameters]	1001	Save drive parameters to non-volatile memory
2	[Load file 1]	6001	Load the data from file 1 on a non-volatile media card into the drive provided it is a parameter file
3	[Save to file 1]	4001	Store the drive parameters in file 1 on a non-volatile media card
4	[Load file 2]	6002	Load the data from file 2 on a non-volatile media card into the drive provided it is a parameter file
5	[Save to file 2]	4002	Store the drive parameters in file 2 on a non-volatile media card
6	[Load file 3]	6003	Load the data from file 3 on a non-volatile media card into the drive provided it is a parameter file
7	[Save to file 3]	4003	Store the drive parameters in file 3 on a non-volatile media card
8	[Show non-default]	12000	Only display parameters that are different from their default value
9	[Destinations]	12001	Only display parameters that are used to set-up destinations
10	[Reset 50Hz defs]	1233	Load 50Hz defaults
11	[Reset 60Hz defs]	1244	Load 60Hz defaults
12	[Reset modules]	1070	Reset all option modules
13	[Read Enc. NP P1]	11001	Encoder electronic nameplate transfer from the encoder connected to drive P1 interface to the drive.
14	[Read Enc. NP P2]	11051	Encoder electronic nameplate transfer from the encoder connected to drive P2 interface to the drive.

Saving drive parameters

User-save and power-down save drive parameters are stored in non-volatile memory within the drive. Any values that have changed are copied to this memory under the following conditions.

Parameter type	Conditions for copy to non-volatile memory
User-save parameter not visible in menu 0	Drive reset with 1000 in <i>Parameter mm.000</i> (mm.000) if the drive is not in the under voltage state and the standard under voltage threshold is being used (i.e. <i>Low Under Voltage Threshold Select</i> (06.067) = 0). OR A drive reset with 1001 in <i>Parameter mm.000</i> (mm.000). OR After parameters are transferred from a non-volatile media card. OR After the drive mode is changed. OR After default parameters are loaded. OR After parameters are transferred from an electronic nameplate.
User save parameter visible in menu 0	Under the conditions given above for user save parameters not visible in Menu 0. OR If the keypad is in edit mode for a user-save parameter in Menu 0, the parameter is saved when the keypad mode is changed from edit mode.
Power-down save parameter	A drive reset with 1000 in <i>Parameter mm.000</i> (mm.000) if the drive is not in the under voltage state and the standard under voltage threshold is being used (i.e. <i>Low Under Voltage Threshold Select</i> (06.067) = 0). OR A drive reset with 1001 in <i>Parameter mm.000</i> (mm.000). OR On the transition into the under voltage state when the standard under voltage threshold is being used (i.e. <i>Low Under Voltage Threshold Select</i> (06.067) is zero). OR After the drive mode is changed. OR After parameters are transferred from a non-volatile media card which results in the drive mode changing.

It can take some time for parameter data to be copied to non-volatile memory, especially if there are a large number of differences between the parameter values in the drive and the values stored in the memory. Saving Power-down save parameters takes a maximum of 300ms, but saving user-save parameters can take several seconds. If the drive is powered from a 24V control supply, or from a low voltage supply, the power down time of the control system can be very short and there is a risk that either the stored values of the power-down save or user-save parameters could be corrupted. This would result in an *EEPROM Fail* trip at the next power-up. To reduce this risk, the power-down save and user-save parameters are each stored in two banks. The banks are alternated each time a save is performed and the bank pointer is only updated once the save is complete. If the new bank is

corrupted a *User Save* or *Power Down Save* is initiated at the next power-up indicating an error in the user-save or power-down save data respectively, and the data from the old bank is used. The following points should be noted:

1. If a *User Save* or *Power Down Save* trip occur at power-up then parameter changes made before power down will be lost. To clear these trips a parameter save must be performed. If both the user-save and power-down save data is corrupted then a *Power Down Save* trip is produced.
2. When a Menu 0 parameter is changed its value is saved immediately to the active bank and the bank pointer is not changed. Therefore changes made via Menu 0 are not lost if a *User Save* trip occurs at power-up.
3. When the drive mode changes all the data in both banks in the non-volatile memory is cleared and the default parameters are saved in both banks. Therefore there is an extended parameter saving period immediately after a drive mode change.
4. Two banks are not provided in non-volatile media cards therefore the card could be corrupted if the power is removed when the drive is writing data to the card.

Loading defaults

A drive reset with 1233 in *Parameter mm.000* (mm.000) loads the defaults defined for each parameter. If defaults are loaded with 1244 in *Parameter mm.000* (mm.000) then the parameters in the table below have different defaults that are intended for the 60Hz regions.

Parameter	Default	Drive modes	Drive voltage rating
Maximum reference clamp (01.006)	60.0Hz	Open-loop	All
Maximum reference clamp (01.006)	1800rpm	RFC-A	All
Standard Ramp Voltage (02.008)	775V	Open-loop, RFC-A, RFC-S	400V
Rated Frequency (05.006)	60.0Hz	Open-loop, RFC-A	All
Rated Load rpm (05.008)	1800rpm	Open-loop	All
Rated Load rpm (05.008)	1770rpm	RFC-A	All
Rated Voltage (05.009)	460V	Open-loop, RFC-A, RFC-S	400V
M2 Maximum Reference Clamp (21.001)	60.0Hz	Open-loop	All
M2 Maximum Reference Clamp (21.001)	1800rpm	RFC-A	All
M2 Rated Frequency (21.006)	60.0Hz	Open-loop, RFC-A	All
M2 Rated Load rpm (21.008)	1800rpm	Open-loop	All
M2 Rated Load rpm (21.008)	1770rpm	RFC-A	All
M2 Rated Voltage (21.009)	460V	Open-loop, RFC-A, RFC-S	All

Non-volatile media card data transfer

Details of the data that can be stored on a non-volatile media card and the methods to transfer/access this data are given in Menu 11.

Stored HF trips

When the drive is subsequently powered up a *Stored HF* trip is initiated where the sub-trip number is the number of the HF trip that last occurred. This trip will occur at every power-up until it is reset. The trip can only be reset by first entering 1299 into *Parameter mm.000* (mm.000). If the drive is powered up and a *Stored HF* trip occurs, *Onboard User Program: Enable* (Pr 11.047) is reset to zero to prevent the on-board user program from running. This ensures that the user program can be changed or erased in case it causes an HF trip at every power-up. Once the *Stored HF* is cleared, it is necessary to power cycle the drive or to re-download the user program to allow the program to restart.

Electronic nameplate

The electronic nameplate is stored in an encoder as a table of bytes as shown in the example below which contains 7 parameter objects.

N1	N0	CRC3	CRC2	CRC1	CRC0	FLG1	FLG0	0xFF	0xFF	0xFF	0xFF	0xFF	0xFF	0xFF	0xFF
M	P	V3	V2	V1	V0	M	P	V3	V2	V1	V0	M	P	V3	V2
V1	V0	M	P	V3	V2	V1	V0	M	P	V3	V2	V1	V0	M	P
V3	V2	V1	V0	M	P	V3	V2	V1	V0						

N1(MS byte) and N0(LS byte) gives the number of parameter objects stored in the nameplate. In this example N1=0x00 and N0=0x07.

CRC3 (MS byte) to CRC0 (LS byte) is a 32 bit CRC applied to all bytes in the nameplate except for the number of parameter objects and the CRC. The CRC is generated with a reverse polynomial 0xEDB88320.

FLG1 (MS byte) and FLG0 (LS byte) are assigned for bit flags. At present none of these flags are used, and so these bytes are always zero.

Each parameter object consists of 6 bytes:

M is the menu number between 1 and 41.

P is the parameter number between 0 and 255.

V3 (MS byte) to V0 (LS byte) give a signed 32 bit parameter value. This is equivalent to the largest parameter size used by the drive, and so it can be used to hold the maximum or minimum value of any parameter.

The total size of the nameplate in bytes is the 16 header bytes plus 6 x number of parameter objects.

In an EnDat encoder the nameplate begins at the start of MRS area 0xAB and finishes at the end of MRS area 0xAD. Although not guaranteed, these areas normally both consist of 256 words giving a total size of 1024 bytes. Therefore a nameplate can hold up to (1024 - 16 (header)) / 6 = 168 parameter objects. The time to read the nameplate is approximately 60ms per parameter object when *P1 Device Type* (03.038) is SC.EnDat, and 120ms per parameter when *P1 Device Type* (03.038) is EnDat.

In a Hiperface encoder the nameplate can be stored in up to 8 datafields starting at the beginning of datafield 0. The size of datafields can be between 16 and 128 bytes. It is recommended that 128 byte datafields are used, and so the maximum size of the nameplate is 1024 bytes. Therefore a nameplate can hold up to (1024 - 16 (header)) / 6 = 168 parameter objects. The time to read the nameplate is approximately 100ms per parameter object.

The nameplate can hold any parameters stored in drive menus (i.e. 1 to 41). If the menu and parameter number correspond to a parameter that does not exist or is read-only then the parameter is simply not written and no trip is initiated. If the value of the parameter is out of range for the parameter then the parameter is not written and a no trip is initiated.

Current Ratings

The tables below give the maximum output current ratings, peak current ratings and power ratings for all drive sizes and voltage ratings.

200V Rated Drives

Model	Heavy Duty					Normal Duty				Kc
	Rated Current	Motor Shaft Power		Peak Current Open Loop	Peak Current RFC	Rated Current	Motor Shaft Power		Peak Current	
	A	kW	hp	A	A	A	kW	hp	A	
01200022	2.2	0.37	0.5	6.6	6.6	2.2	0.37	0.5	6.6	7.333

Variable Minimum / Maximum Pairs

The descriptions below define the variable minimum/maximum pairs that can be used with parameters when the VM format bit is set. The variable minimum and maximum themselves can be dependent on other parameters, or the drive rating or other conditions as defined. The variable minimum and the variable maximum have a limited range and this is defined for each minimum/maximum pair.

Identifier	VM_AC_VOLTAGE
Description	Range applied to parameters showing a.c. voltage
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 930

VM_AC_VOLTAGE[MAX] in drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_AC_VOLTAGE[MAX]	325	650	780	930

VM_AC_VOLTAGE[MIN] = 0

Identifier	VM_AC_VOLTAGE_SET
Description	Range applied to a.c. voltage set-up parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 765

VM_AC_VOLTAGE_SET[MAX] is drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_AC_VOLTAGE_SET[MAX]	265	530	635	765

VM_AC_VOLTAGE_SET[MIN] = 0

Identifier	VM_ACCEL_RATE
Description	Maximum applied to the ramp rate parameters
Units	s/100Hz, s/1000rpm, s/1000mm/s
Range of [MIN]	Open-loop: 0.0 RFC-A, RFC-S: 0.000
Range of [MAX]	Open-loop: 0.0 to 3200.0 RFC-A, RFC-S: 0.000 to 3200.000

A maximum needs to be applied to the ramp rate parameters because the units are a time for a change of speed from zero to a defined level or to maximum speed. The defined level is 100Hz for Open-loop mode and 1000rpm or 1000mm/s for RFC-A and RFC-S modes. If the change of speed is to the maximum speed then changing the maximum speed changes the actual ramp rate for a given ramp rate parameter value. The variable maximum calculation ensures that longest ramp rate (parameter at its maximum value) is not slower than the rate with the defined level, i.e. 3200.00 s / Hz for Open-loop mode, and 3200.000 s / 1000rpm or 3200.000 s / 1000mm/s for RFC-A and RFC-S modes.

The maximum frequency/speed is taken from *Maximum Reference Clamp* (01.006) if *Select Motor 2 Parameters* (11.045) = 0, or *M2 Maximum Reference Clamp* (21.001) if *Select Motor 2 Parameters* (11.045) = 1.

Open-loop mode

VM_ACCEL_RATE[MIN] = 0.0

If *Ramp Rate Units* (02.039) = 0:

VM_ACCEL_RATE[MAX] = 3200.0

Otherwise:

VM_ACCEL_RATE[MAX] = 3200.0 x Maximum frequency / 100.0

RFC-A, RFC-S modes

VM_ACCEL_RATE[MIN] = 0.000

If *Ramp Rate Units* (02.039) = 0:

VM_ACCEL_RATE[MAX] = 3200.000

Otherwise:

VM_ACCEL_RATE[MAX] = 3200.000 x Maximum speed / 1000.0

Identifier	VM_AMC_JERK_UNIPOLAR

VM_AMC_POSITION_UNIPOLAR is modified by *AMC Auto Resolution Scaling* (31.016) and *AMC Roll Over Limit* (31.010). See the table below.

<i>AMC Roll Over Limit</i> (31.010)	= 0	> 0
VM_AMC_POSITION_UNIPOLAR[MAX]	2147483647 / <i>AMC Auto Resolution Scaling</i> (31.016)	<i>AMC Roll Over Limit</i> (31.010) - 1
VM_AMC_POSITION_UNIPOLAR[MIN]	0	0

Identifier	VM_AMC_RATE
Description	Range applied to the parameters showing the AMC acceleration
Units	User units / ms / ms
Range of [MIN]	1073742.824
Range of [MAX]	1073741.823

VM_AMC_RATE_UNIPOLAR[MAX] = 1073741.823 / AMC Auto Resolution Scaling (31.016)

VM_AMC_RATE_UNIPOLAR[MIN] = -1073741.824 / AMC Auto Resolution Scaling (31.016)

Identifier	VM_AMC_RATE_UNIPOLAR
Description	Unipolar version of VM_AMC_RATE
Units	User units / ms / ms
Range of [MIN]	0
Range of [MAX]	1073741.823

VM_AMC_RATE_UNIPOLAR[MAX] = 1073741.823 / AMC Auto Resolution Scaling (31.016)

VM_AMC_RATE_UNIPOLAR[MIN] = 0

Identifier	VM_AMC_ROLLOVER
Description	Maximum applied to the AMC Rollover parameter
Units	User units
Range of [MIN]	0
Range of [MAX]	1073741823

VM_AMC_ROLLOVER[MAX] = 1073741823 / AMC Auto Resolution Scaling (31.016)

VM_AMC_ROLLOVER[MIN] = 0

Identifier	VM_AMC_SPEED
Description	Range applied to the parameters showing the AMC speed
Units	User units / ms
Range of [MIN]	-21474836.48
Range of [MAX]	21474836.47

VM_AMC_SPEED[MAX] = 21474836.47 / AMC Auto Resolution Scaling (31.016)

VM_AMC_SPEED[MIN] = -21474836.48 / AMC Auto Resolution Scaling (31.016)

Identifier	VM_AMC_SPEED_UNIPOLAR
Description	Unipolar version of VM_AMC_SPEED
Units	User units / ms
Range of [MIN]	0
Range of [MAX]	21474836.47

VM_SPEED_UNIPOLAR[MAX] = 21474836.47 / AMC Auto Resolution Scaling (31.016)

VM_SPEED_UNIPOLAR[MIN] = 0

Identifier	VM_DC_VOLTAGE
Description	Range applied to d.c. voltage reference parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 1190

VM_DC_VOLTAGE[MAX] is the full scale d.c. link voltage feedback (over voltage trip level) for the drive. This level is drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_DC_VOLTAGE[MAX]	415	830	990	1190

VM_DC_VOLTAGE[MIN] = 0

Identifier	VM_DC_VOLTAGE_SET
Description	Range applied to d.c. voltage reference parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0.0 to 1150.0

VM_DC_VOLTAGE_SET[MAX] is drive voltage rating dependent. All values are shown in the table below.

Voltage level	200V	400V	575V	690V
VM_DC_VOLTAGE_SET[MAX]	400	800	955	1150

VM_DC_VOLTAGE_SET[MIN] = 0

Identifier	VM_DRIVE_CURRENT
Description	Range applied to parameters showing current in A
Units	A
Range of [MIN]	-99999.999 to 0.000
Range of [MAX]	0.000 to 99999.999

VM_DRIVE_CURRENT[MAX] is equivalent to the full scale (over current trip level) for the drive and is given by *Full Scale Current Kc* (11.061).

VM_DRIVE_CURRENT[MIN] = - VM_DRIVE_CURRENT[MAX]

Identifier	VM_DRIVE_CURRENT_UNIPOLAR
Description	Unipolar version of VM_DRIVE_CURRENT
Units	A
Range of [MIN]	0.000
Range of [MAX]	0.000 to 99999.999

VM_DRIVE_CURRENT_UNIPOLAR[MAX] = VM_DRIVE_CURRENT[MAX]

VM_DRIVE_CURRENT_UNIPOLAR[MIN] = 0.000

Identifier	VM_HIGH_DC_VOLTAGE
Description	Range applied to the parameters showing high d.c. voltage
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 1500

VM_HIGH_DC_VOLTAGE[MAX] = 1500. This is the full scale d.c. link voltage feedback for the high d.c. link voltage measurement which can measure the voltage if it goes above the normal full scale value.

VM_HIGH_DC_VOLTAGE[MIN] = 0

Identifier	VM_LOW_UNDER_VOLTS
Description	Range applied to the low under voltage threshold
Units	V
Range of [MIN]	24
Range of [MAX]	24 to 1150

If *Back-up Mode Enable* (06.068) = 0

VM_LOW_UNDER_VOLTS[MAX] = VM_STD_UNDER_VOLTS[MIN]

Otherwise

VM_LOW_UNDER_VOLTS[MAX] = VM_STD_UNDER_VOLTS[MIN] / 1.1.

VM_LOW_UNDER_VOLTS[MIN] = 0.

Identifier	VM_MIN_SWITCHING_FREQUENCY
Description	Range applied to the minimum switching frequency parameter
Units	User units
Range of [MIN]	0
Range of [MAX]	0 to 6

VM_MIN_SWITCHING_FREQUENCY[MAX] = *Maximum Switching Frequency* (05.018)

VM_MIN_SWITCHING_FREQUENCY[MIN] = 0 for motor control modes, or 1 for Regen mode (subject to the maximum)

Identifier	VM_MOTOR1_CURRENT_LIMIT
Description	Range applied to current limit parameters (motor 1)
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0

VM_MOTOR1_CURRENT_LIMIT[MAX] is dependent on the drive rating and motor set-up parameters.

VM_MOTOR1_CURRENT_LIMIT[MIN] = 0.00

Identifier	VM_MOTOR2_CURRENT_LIMIT
Description	Range applied to current limit parameters (motor 2)
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0

VM_MOTOR2_CURRENT_LIMIT[MAX] is dependent on the drive rating and motor set-up parameters.

VM_MOTOR2_CURRENT_LIMIT[MIN] = 0.0

Identifier	VM_NEGATIVE_REF_CLAMP1
Description	Limits applied to the negative frequency or speed clamp (motor 1)
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: -599.0 to 0.0 RFC-A, RFC-S: -550 x 60 / Motor pole pairs to 0.0
Range of [MAX]	Open-loop: 0.0 to 599.0 RFC-A, RFC-S: 0.0 to 550 x 60 / Motor pole pairs

This variable maximum/minimum defines the range of the negative frequency or speed clamp associated with motor map 1 (*Minimum Reference Clamp* (01.007)). The minimum and maximum are affected by the settings of the *Negative Reference Clamp Enable* (01.008), *Bipolar Reference Enable* (01.010) and *Maximum Reference Clamp* (01.006) as shown in the table below.

Negative Reference Clamp Enable (01.008)	Bipolar Reference Enable (01.010)	VM_NEGATIVE_REF_CLAMP1[MIN]	VM_NEGATIVE_REF_CLAMP1[MAX]
0	0	0.0	Pr 01.006
0	1	0.0	0.0
1	X	-VM_POSITIVE_REF_CLAMP[MAX]	0.0

Identifier	VM_NEGATIVE_REF_CLAMP2
Description	Limits applied to the negative frequency or speed clamp (motor 2)
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: -599.0 to 0.0 RFC-A, RFC-S: -550 x 60 / Motor pole pairs to 0.0
Range of [MAX]	Open-loop: 0.0 to 599.0 RFC-A, RFC-S: 0.0 to 550 x 60 / Motor pole pairs

This variable maximum/minimum defines the range of the negative frequency or speed clamp associated with motor map 2 (*M2 Minimum Reference Clamp* (21.002)). It is defined in the same way as VM_NEGATIVE_REF_CLAMP1 except that the *M2 Maximum Reference Clamp* (21.001) is used instead of *Maximum Reference Clamp* (01.006).

Identifier	VM_POSITIVE_REF_CLAMP1
Description	Limits applied to the positive frequency or speed reference clamp
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: 0.0 RFC-A, RFC-S: 0.0
Range of [MAX]	Open-loop: 0.0 to 599.0 RFC-A, RFC-S: 0.0 to 550 x 60 / Motor pole pairs

VM_POSITIVE_REF_CLAMP1[MAX] defines the range of the positive reference clamp, *Maximum Reference Clamp* (01.006), which in turn limit the references. In RFC-A and RFC-S modes an additional limit is applied so that the position feedback does not exceed the speed where the drive can no longer interpret the feedback signal correctly as given in the table below. The limit is based on the position feedback device selected with *Motor Control Feedback Select* (03.026). It is possible to disable this additional limit if the *RFC Feedback Mode* (03.024) ≥ 1 , so that the motor can be operated at a speed above the level where the drive can interpret the feedback in sensorless mode. It should be noted that the position feedback device itself may have a maximum speed limit that is lower than those given in the table. Care should be taken not to exceed a speed that would cause damage to the position feedback device.

Feedback device	VM_POSITIVE_REF_CLAMP1[MAX]
AB, AB Servo	(500kHz x 60 / rotary lines per revolution) rpm (500kHz x linear line pitch in mm) mm/s
FD, FR, FD Servo, FR Servo	(500kHz x 60 / rotary lines per revolution)/2 rpm (500kHz x linear line pitch in mm)/2 mm/s
SC, SC Hiper, SC EnDat, SC SSI, SC Servo	(500kHz x 60 / sine waves per revolution) rpm (500kHz x linear line pitch in mm) mm/s
Resolver	30000 rpm* (250Hz x pole pitch in mm) mm/s
Any other device	50000.0 rpm or mm/s*

*Note that even though these are shown as fixed values they are subject to the maximum of 550 x 60 / Motor Pole Pairs, as are all the other values in this table.

The limit ensures that the frequency of incremental digital or sine wave signals from the encoder do not exceed 500kHz and the modulation frequency for a resolver does not exceed 1kHz, neglecting any speed controller overshoot. The position feedback resolution remains fixed over the whole frequency for digital signals, but reduces with increased frequency or reduced voltage with sine wave signals. The position resolution with sine wave signals is given by the equations below.

Position resolution for a rotary device = K x sine waves per revolution

Position resolution for a linear device = K x sine waves per pole pitch

The value of K varies with the frequency and magnitude of the sine wave signals. The nominal value of K is 1024, and the drive interface provides at least this resolution with 1.0Vp-p sine waves up to a frequency of 50kHz. The table below shows the variation of K with sine wave peak to peak voltage and frequency.

	1kHz	5kHz	50kHz	100kHz	200kHz	500kHz
1.2Vp-p	2048	2048	1024	1024	512	512
1.0Vp-p	2048	2048	1024	512	512	128
0.8Vp-p	1024	1024	1024	512	256	128
0.6Vp-p	1024	1024	512	512	256	128
0.4Vp-p	512	512	512	256	128	64

VM_POSITIVE_REF_CLAMP1[MIN] = 0.0

VM_POSITIVE_REF_CLAMP2[MAX] defines the range of the positive reference clamp, *M2 Maximum Reference Clamp* (21.001), which in turn limit the references. See VM_POSITIVE_REF_CLAMP1 for more details.

Identifier	VM_POWER
Description	Range applied to parameters that either set or display power
Units	kW
Range of [MIN]	-99999.999 to 0.000
Range of [MAX]	0.000 to 99999.999

VM_POWER[MAX] is rating dependent and is chosen to allow for the maximum power that can be output by the drive with maximum a.c. output voltage, at maximum controlled current and unity power factor.

$VM_POWER[Max] = \sqrt{3} \times VM_AC_VOLTAGE[Max] \times VM_DRIVE_CURRENT[Max] / 1000$

VM_POWER[MIN] = -VM_POWER[MAX]

Identifier	VM_RATED_CURRENT
Description	Range applied to rated current parameters
Units	A
Range of [MIN]	0.000
Range of [MAX]	0.000 to 99999.999

VM_RATED_CURRENT [MAX] = *Maximum Rated Current* (11.060) and is dependent on the drive rating.

VM_RATED_CURRENT [MIN] = 0.000

Identifier	VM_REGEN_REACTIVE
Description	Range applied to the reactive current reference in Regen mode
Units	%
Range of [MIN]	-1000.0 to 0.0
Range of [MAX]	0.0 to 1000.0

VM_REGEN_REACTIVE[MAX] applies a limit to the reactive current reference in Regen mode so that the total current reference does not exceed its maximum allowed level.

VM_REGEN_REACTIVE[MIN] = - VM_REGEN_REACTIVE[MAX]

Identifier	VM_SPEED
Description	Range applied to parameters showing speed
Units	Open-loop, RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop, RFC-A, RFC-S: -50000.0 to 0.0
Range of [MAX]	Open-loop, RFC-A, RFC-S: 0.0 to 50000.0

This variable minimum/maximum defines the range of speed monitoring parameters. To allow headroom for overshoot the range is set to twice the range of the speed references.

$$VM_SPEED[MIN] = 2 \times VM_SPEED_FREQ_REF[MIN]$$

$$VM_SPEED[MAX] = 2 \times VM_SPEED_FREQ_REF[MAX]$$

Identifier	VM_SPEED_FREQ_KEYPAD_REF
Description	Range applied to the keypad reference
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: -599.0 to 599.0 RFC-A, RFC-S: -550 x 60 / Motor pole pairs to 550 x 60 / Motor pole pairs
Range of [MAX]	Open-loop: 0.0 to 5990.0 RFC-A, RFC-S: 0.0 to 550 x 60 / Motor pole pairs

This variable maximum is applied to *Keypad Control Mode Reference* (01.017). The maximum applied to these parameters is the same as other frequency reference parameters.

$$VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX]$$

However the minimum is dependent on *Negative Reference Clamp Enable* (01.008) and *Bipolar Reference Enable* (01.010).

Negative Reference Clamp Enable (01.008)	Bipolar Reference Enable (01.010)	VM_SPEED_FREQ_USER_REFS[MIN]
0	0	If <i>Select Motor 2 Parameters</i> (11.045) = 0 <i>Minimum Reference Clamp</i> (01.007), otherwise <i>M2 Minimum Reference Clamp</i> (21.002)
0	1	-VM_SPEED_FREQ_REF[MAX]
1	0	0.0
1	1	-VM_SPEED_FREQ_REF[MAX]

Identifier	VM_SPEED_FREQ_REF
Description	Range applied to the frequency or speed reference parameters
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: -599.0 to 0.0 RFC-A, RFC-S: -550 x 60 / Motor pole pairs to 0.0
Range of [MAX]	Open-loop: 0.0 to 599.0 RFC-A, RFC-S: 0.0 to 550 x 60 / Motor pole pairs

This variable minimum/maximum is applied throughout the frequency and speed reference system so that the references can vary in the range from the minimum to maximum clamps.

Negative Reference Clamp Enable (01.008)	VM_SPEED_FREQ_REF[MAX] if Select Motor 2 Parameters (11.045) = 0	VM_SPEED_FREQ_REF[MAX] if Select Motor 2 Parameters (11.045) = 1
0	<i>Maximum Reference Clamp</i> (01.006)	<i>M2 Maximum Reference Clamp</i> (21.001)
1	<i>Maximum Reference Clamp</i> (01.006) or <i>Minimum Reference Clamp</i> (01.007) whichever the larger	<i>M2 Maximum Reference Clamp</i> (21.001) or <i>M2 Minimum Reference Clamp</i> (21.002) whichever the larger

$$VM_SPEED_FREQ_REF[MIN] = -VM_SPEED_FREQ_REF[MAX].$$

Identifier	VM_SPEED_FREQ_REF_UNIPOLAR
Description	Unipolar version of VM_SPEED_FREQ_REF
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: 0.0 RFC-A, RFC-S: 0.0
Range of [MAX]	Open-loop: 0.0 to 599.0 RFC-A, RFC-S: 0.0 to 550 x 60 / Motor pole pairs

$$VM_SPEED_FREQ_REF_UNIPOLAR[MAX] = VM_SPEED_FREQ_REF[MAX]$$

$$VM_SPEED_FREQ_REF_UNIPOLAR[MIN] = 0.0$$

Identifier	VM_SPEED_FREQ_USER_REFS
Description	Range applied to analogue reference parameters
Units	Open-loop: Hz RFC-A, RFC-S: rpm or mm/s
Range of [MIN]	Open-loop: -599.00 to 599.00 RFC-A, RFC-S: -550 x 60 / Motor pole pairs to 550 x 60 / Motor pole pairs
Range of [MAX]	Open-loop: 0.0 to 599.00 RFC-A, RFC-S: 0.0 to 550 x 60 / Motor pole pairs

This variable maximum is applied to *Analogue Reference 1* (01.036) and *Analogue Reference 2* (01.037). It should be noted that in Open-loop mode the analogue reference parameters have two decimal places.

The maximum applied to these parameters is the same as other frequency reference parameters.

$$VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX]$$

However the minimum is dependent on *Negative Reference Clamp Enable* (01.008) and *Bipolar Reference Enable* (01.010).

<i>Negative Reference Clamp Enable</i> (01.008)	<i>Bipolar Reference Enable</i> (01.010)	VM_SPEED_FREQ_USER_REFS[MIN]
0	0	If <i>Select Motor 2 Parameters</i> (11.045) = 0 <i>Minimum Reference Clamp</i> (01.007), otherwise <i>M2 Minimum Reference Clamp</i> (21.002)
0	1	-VM_SPEED_FREQ_REF[MAX]
1	0	0.0
1	1	-VM_SPEED_FREQ_REF[MAX]

Identifier	VM_STD_UNDER_VOLTS
Description	Range applied to the standard under voltage threshold
Units	V
Range of [MIN]	0 to 1150
Range of [MAX]	0 to 1150

$$VM_STD_UNDER_VOLTS[MAX] = VM_DC_VOLTAGE_SET / 1.1$$

VM_STD_UNDER_VOLTS[MIN] is voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_STD_UNDER_VOLTS[MIN]	175	330	435	435

Identifier	VM_SUPPLY_LOSS_LEVEL
Description	Range applied to the supply loss threshold
Units	V
Range of [MIN]	0 to 1150
Range of [MAX]	0 to 1150

$$VM_SUPPLY_LOSS_LEVEL[MAX] = VM_DC_VOLTAGE_SET[MAX]$$

VM_SUPPLY_LOSS_LEVEL[MIN] is drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_SUPPLY_LOSS_LEVEL[MIN]	205	410	540	540

Identifier	VM_SWITCHING_FREQUENCY
Description	Range applied to the maximum switching frequency parameters
Units	User units
Range of [MIN]	0
Range of [MAX]	0 to 6

$$VM_SWITCHING_FREQUENCY[MAX] = \text{Power stage dependent}$$

VM_SWITCHING_FREQUENCY[MIN] = 0 for motor control modes, or 1 for Regen mode (subject to the maximum)

Identifier	VM_TORQUE_CURRENT
Description	Range applied to torque and torque producing current parameters. (Where this is used in Regen mode it refers to the active current.)
Units	%
Range of [MIN]	-1000.0 to 0.0
Range of [MAX]	0.0 to 1000.0

Select Motor 2 Parameters (11.045)	VM_TORQUE_CURRENT[MAX]
0	VM_MOTOR1_CURRENT_LIMIT[MAX]
1	VM_MOTOR2_CURRENT_LIMIT[MAX]

VM_TORQUE_CURRENT[MIN] = -VM_TORQUE_CURRENT[MAX]

Identifier	VM_TORQUE_CURRENT_UNIPOLAR
Description	Unipolar version of VM_TORQUE_CURRENT
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0

VM_TORQUE_CURRENT_UNIPOLAR[MAX] = VM_TORQUE_CURRENT[MAX]

VM_TORQUE_CURRENT_UNIPOLAR[MIN] = 0.0

Identifier	VM_USER_CURRENT
Description	Range applied to torque reference and percentage load parameters with one decimal place
Units	%
Range of [MIN]	-1000.0 to 0.0
Range of [MAX]	0.0 to 1000.0

VM_USER_CURRENT[MAX] = *User Current Maximum Scaling* (04.024)

VM_USER_CURRENT[MIN] = -VM_USER_CURRENT[MAX]

Identifier	VM_USER_CURRENT_HIGH_RES
Description	Range applied to torque reference and percentage load parameters with two decimal places
Units	%
Range of [MIN]	-1000.00 to 0.00
Range of [MAX]	0.00 to 1000.00

VM_USER_CURRENT_HIGH_RES[MAX] = *User Current Maximum Scaling* (04.024) with an additional decimal place

VM_USER_CURRENT_HIGH_RES[MIN] = -VM_USER_CURRENT_HIGH_RES[MAX]

Menu 1 – *Frequency References*

Mode: Open-Loop

Parameter	01.001 Reference Selected		
Short description	Displays the basic reference selected from the available sources		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	Units		
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, VM, ND, NC, PT		

Reference Selected (01.001) is the basic reference selected from the available sources including the effect of the reference offset.

Parameter	01.002 Pre-skip Filter Reference		
Short description	Displays the level of the reference after the reference clamps		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, VM, ND, NC, PT		

The *Pre-skip Filter Reference* (01.002) is the level of the reference after the reference clamps but before the skip filters.

Parameter	01.003 Pre-ramp Reference		
Short description	Displays the final output from the Menu 1 reference system		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, VM, ND, NC, PT		

The *Pre-ramp Reference* (01.003) is the final output from the Menu 1 reference system that is fed into the Menu 2 ramp system.

Parameter	01.004 Reference Offset		
Short description	Defines the the offset applied to the reference		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

If *Reference Offset Select* (01.009) = 0 then *Reference Selected* (01.001) is the selected reference multiplied by $[1 + (\text{Percentage Trim (01.038)} / 100.00)]$.
If *Reference Offset Select* (01.009) = 1 then the *Reference Offset* (01.004) is added to the selected reference to give *Reference Selected* (01.001).

Parameter	01.005 Jog Reference		
Short description	Defines the reference when jog is enabled		
Mode	Open-Loop		
Minimum	0.0	Maximum	400.0
Default	0.0	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW		

The *Jog Reference* (01.005) is selected when *Jog Select* (01.013) = 1. *Jog Select* (01.013) is controlled by the drive sequencer (see Menu 6).

Parameter	01.006 Maximum Reference Clamp		
Short description	Defines the maximum value for the reference		
Mode	Open-Loop		
Minimum	-VM_POSITIVE_REF_CLAMP1	Maximum	VM_POSITIVE_REF_CLAMP1
Default	See exceptions below	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

Region	Default Value
50Hz	50.0
60Hz	60.0

Maximum Reference Clamp (01.006) provides a limit on the maximum frequency or speed. (If *Select Motor 2 Parameters* (11.045) = 1 then *M2 Maximum Reference Clamp* (21.001) is used instead.)

Parameter	01.007 <i>Minimum Reference Clamp</i>		
Short description	Defines the minimum value for the reference		
Mode	Open-Loop		
Minimum	-VM_NEGATIVE_REF_CLAMP1	Maximum	VM_NEGATIVE_REF_CLAMP1
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

If *Negative Reference Clamp Enable* (01.008) = 1 then *Minimum Reference Clamp* (01.007) is forced to be a negative value and is applied to the final reference as the negative limit. If *Negative Reference Clamp Enable* (01.008) = 0 then *-Maximum Reference Clamp* (01.006) is applied to the final reference as the negative limit. (If *Select Motor 2 Parameters* (11.045) = 1 then *M2 Minimum Reference Clamp* (21.002) is used instead.)

The minimum reference clamp is also used to provide the minimum speed limit for uni-polar mode (i.e. *Bipolar Reference Enable* (01.010) = 0) after the *Reference Selected* (01.001).

Parameter	01.008 <i>Negative Reference Clamp Enable</i>		
Short description	Set to 1 to allow the minimum reference clamp value to be negative		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Minimum Reference Clamp* (01.007).

Parameter	01.009 <i>Reference Offset Select</i>		
Short description	Enables the use of the reference offset		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Reference Offset* (01.004).

Parameter	01.010 <i>Bipolar Reference Enable</i>		
Short description	Enables the minimum value of the reference to be negative		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Minimum Reference Clamp* (01.007).

Parameter	01.011 <i>Reference On</i>		
Short description	Indicates that the reference from the reference system is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Reference On (01.011), which is controlled by the drive sequencer (see Menu 6) indicates that the reference from the reference system is active. Note that *Reference On* (01.011) is also used in RFC-A and RFC-S modes to enable and disable the *Hard Speed Reference* (03.022).

Parameter	01.012 <i>Reverse Select</i>		
Short description	Indicates when the reverse function is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Reverse Select (01.012), which is controlled by the drive sequencer (see Menu 6), is used to invert *Reference Selected* (01.001) or the *Jog Reference* (01.005).

Parameter			
01.013 Jog Select			
Short description	Indicates when the jog function is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Jog Select (01.013), which is controlled by the drive sequencer (see Menu 6), is used to select the *Jog Reference* (01.005).

Parameter			
01.014 Reference Selector			
Short description	Defines the source for the references		
Mode	Open-Loop		
Minimum	0	Maximum	6
Default	1	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	A1 A2
1	A1 Preset
2	A2 Preset
3	Preset
4	Keypad
5	Precision
6	Keypad Ref

Reference Selector (01.014) defines how *Reference Selected Indicator* (01.049) is derived. If *Reference Selector* (01.014) is not 0 then *Reference Selected Indicator* (01.049) is equal to *Reference Selector* (01.014). If *Reference Selector* (01.014) = 0 then *Reference Selected Indicator* (01.049) is controlled by the reference select flags as shown below. The higher numbered flags have priority over the lower numbered flags.

Reference select flag states	Reference Selected Indicator (01.049)
All reference select flags equal to 0	1
<i>Reference Select Flag 1</i> (01.041) = 1	2
<i>Reference Select Flag 2</i> (01.042) = 1	3
<i>Reference Select Flag 3</i> (01.043) = 1	4
<i>Reference Select Flag 4</i> (01.044) = 1	5

Preset Selector (01.015) defines how *Preset Selected Indicator* (01.050) is derived as shown below.

Preset Selector (01.015)	Preset Selected Indicator (01.050)
0	Controlled by the preset select flags (01.045 to 01.047)
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	8
9	Controlled by the preset reference selector timer (see <i>Preset Selector Timer</i> (01.016))

When *Preset Selector* (01.015) = 0 then *Preset Selected Indicator* (01.050) is defined by the preset select flags as shown below.

Preset Select Flag 3 (01.047)	Preset Select Flag 2 (01.046)	Preset Select Flag 1 (01.045)	Preset Selected Indicator (01.050)
0	0	0	1
0	0	1	2
0	1	0	3
0	1	1	4
1	0	0	5
1	0	1	6
1	1	0	7
1	1	1	8

Reference Selected Indicator (01.049) and Preset Selected Indicator (01.050) then define the reference to be used as shown below.

Reference Selected Indicator (01.049)	Preset Selected Indicator (01.050)	Reference
1	1	Analog Reference 1 (01.036)
1	>1	Preset reference defined by the value of Preset Selected Indicator (01.050)
2	1	Analog Reference 2 (01.037)
2	>1	Preset reference defined by the value of Preset Selected Indicator (01.050)
3	x	Preset reference defined by the value of Preset Selected Indicator (01.050)
4	x	Keypad Control Mode Reference (01.017)
5	x	Precision Reference Coarse (01.018) and Precision Reference Fine (01.019)
6	x	Keypad Control Mode Reference (01.017)

If Reference Selected Indicator (01.049) = 4 the Keypad Control Mode Reference (01.017) is used and the sequencer operates in keypad mode where the start, stop and optionally the reverse selection functions are provided from the drive keypad. Jog Select (01.013) and Speed Feed-forwards Select (01.040) are always 0 when keypad mode is active.

If Reference Selected Indicator (01.049) = 6 the Keypad Control Mode Reference (01.017) is used, but keypad control mode is not active.

Parameter	01.015 Preset Selector		
Short description	Defines which preset is used for the reference		
Mode	Open-Loop		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See Reference Selector (01.014).

Parameter	01.016 Preset Selector Timer		
Short description	Defines the time between changes of preset selector		
Mode	Open-Loop		
Minimum	0.0	Maximum	400.0
Default	10.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

If Preset Selector (01.015) = 9 then Preset Selected Indicator (01.050) is incremented by one at intervals defined by Preset Selector Timer (01.016). When Preset Selected Indicator (01.050) has a value of 8 and is incremented it rolls over to 1. If Preset Selector Timer Reset (01.048) = 1 and Preset Selector (01.015) = 9, then Preset Selected Indicator (01.050) is held at 1.

Parameter	01.017 Keypad Control Mode Reference		
Short description	Defines the value of the keypad reference		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_KEYPAD_REF	Maximum	VM_SPEED_FREQ_KEYPAD_REF
Default	0.0	Units	
Type	32 Bit Power Down Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RO, VM, NC, PT		

Keypad control mode is active if the Reference Selected Indicator (01.049) is 4 or 6. The value of this parameter is controlled by the reference selector system and whether Hand/Off/Auto mode is selected (see Hand/Off/Auto Operating Mode (01.052)). If keypad control is selected the frequency/speed reference is defined by Keypad Control Mode Reference (01.017) which is a read-only parameter. The parameter can only be adjusted by pressing the Up or Down keys when the keypad is in Status Mode and only when keypad control mode is active. Holding the Up or down keys auto-increments or decrements Keypad Control Mode Reference (01.017), and the rate of adjustment increases the longer the key is held. Keypad Control Mode Reference (01.017) can be adjusted whether the drive is enabled or not, and can be retained at power-down if required (see Power-

up Keypad Control Mode Reference (01.051)).

If the *Reference Selected Indicator* (01.049) is 6 then the normal drive sequencer is used and the run commands are derived from the sequencer control bit parameters. If *Reference Selected Indicator* (01.049) is 4 then the keypad control sequencer is used and the drive run commands are derived using keys on the keypad. If the keypad control sequencer is active the Stop and Run keys automatically become active and the Auxilliary key may be optionally enabled as the reverse key with *Enable Auxiliary Key* (06.013).

Parameter	01.018 Precision Reference Coarse		
Short description	Defines the value of the coarse precision reference		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

The *Precision Reference Coarse* (01.018) and *Precision Reference Fine* (01.019) can be combined to provide a reference with a precision of 3 decimal places. The precision reference value is given by *Precision Reference Coarse* (01.018) + *Precision Reference Fine* (01.019), therefore *Precision Reference Fine* (01.019) increases positive values of *Precision Reference Coarse* (01.018) away from zero, and negative values of *Precision Reference Coarse* (01.018) towards zero.

If *Precision Reference Update Disable* (01.020) = 0 then any changes to *Precision Reference Coarse* (01.018) or *Precision Reference Fine* (01.019) have an effect immediately. When *Precision Reference Update Disable* (01.020) is changed to 1 then *Precision Reference Coarse* (01.018) and *Precision Reference Fine* (01.019) are stored in memory and used to provide the precision reference until *Precision Reference Update Disable* (01.020) is changed back to 0. This allows the component values of the precision reference to be changed without giving an unwanted intermediate value due to data skew.

Parameter	01.019 Precision Reference Fine		
Short description	Defines the value of the fine precision reference		
Mode	Open-Loop		
Minimum	0.000	Maximum	0.099
Default	0.000	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Precision Reference Coarse* (01.018).

Parameter	01.020 Precision Reference Update Disable		
Short description	Set to 1 to prevent immediate update to the reference from the precision reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Precision Reference Coarse* (01.018).

Parameter	01.021 Preset Reference 1		
Short description	Defines the value for preset reference 1		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.022 Preset Reference 2		
Short description	Defines the value for preset reference 2		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.023 Preset Reference 3		
Short description	Defines the value for preset reference 3		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.024 Preset Reference 4		
Short description	Defines the value for preset reference 4		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.025 Preset Reference 5		
Short description	Defines the value for preset reference 5		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.026 Preset Reference 6		
Short description	Defines the value for preset reference 6		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.027 Preset Reference 7		
Short description	Defines the value for preset reference 8		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.028 Preset Reference 8		
Short description	Defines the value for preset reference 8		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.029 Skip Reference 1		
Short description	Defines the 1st reference point to skip		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	0.0	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

The skip references functions are available to prevent continuous operation within a specified speed range (i.e. where mechanical resonance may occur). When *Skip Reference 1* (01.029) = 0 Filter 1 is disabled. *Skip Reference Band 1* (01.030) defines the range either side of *Skip Reference 1* (01.029) over which references are rejected in either direction. The actual rejection band is therefore twice that defined by *Skip Reference Band 1* (01.030) with *Skip Reference 1* (01.029) as the centre of the band. When the selected reference is within the rejection band the lower limit of the band is passed through the filter so that reference is always less than demanded.

Filter 2 (*Skip Reference 2* (01.031), *Skip Reference Band 2* (01.032)) and Filter 3 (*Skip Reference 3* (01.033), *Skip Reference Band 3* (01.034)) operate in the same ways as Filter 1.

If any of the filters are active (i.e. the reference is within their rejection band) *Reference In Rejection Zone* (01.035) is set to 1, otherwise it is 0.

Parameter	01.030 Skip Reference Band 1		
Short description	Defines the range either side of skip reference 1 to be implemented		
Mode	Open-Loop		
Minimum	0.0	Maximum	25.0
Default	0.0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

See *Skip Reference 1* (01.029).

Parameter	01.031 Skip Reference 2		
Short description	Defines the 2nd reference point to skip		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	0.0	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *Skip Reference 1* (01.029).

Parameter	01.032 Skip Reference Band 2		
Short description	Defines the range either side of skip reference 2 to be implemented		
Mode	Open-Loop		
Minimum	0.0	Maximum	25.0
Default	0.0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

See *Skip Reference 1* (01.029).

Parameter	01.033 Skip Reference 3		
Short description	Defines the 3rd reference point to skip		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	0.0	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *Skip Reference 1* (01.029).

Parameter	01.034 Skip Reference Band 3		
Short description	Defines the range either side of skip reference 3 to be implemented		
Mode	Open-Loop		
Minimum	0.0	Maximum	25.0
Default	0.0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

See Skip Reference 1 (01.029).

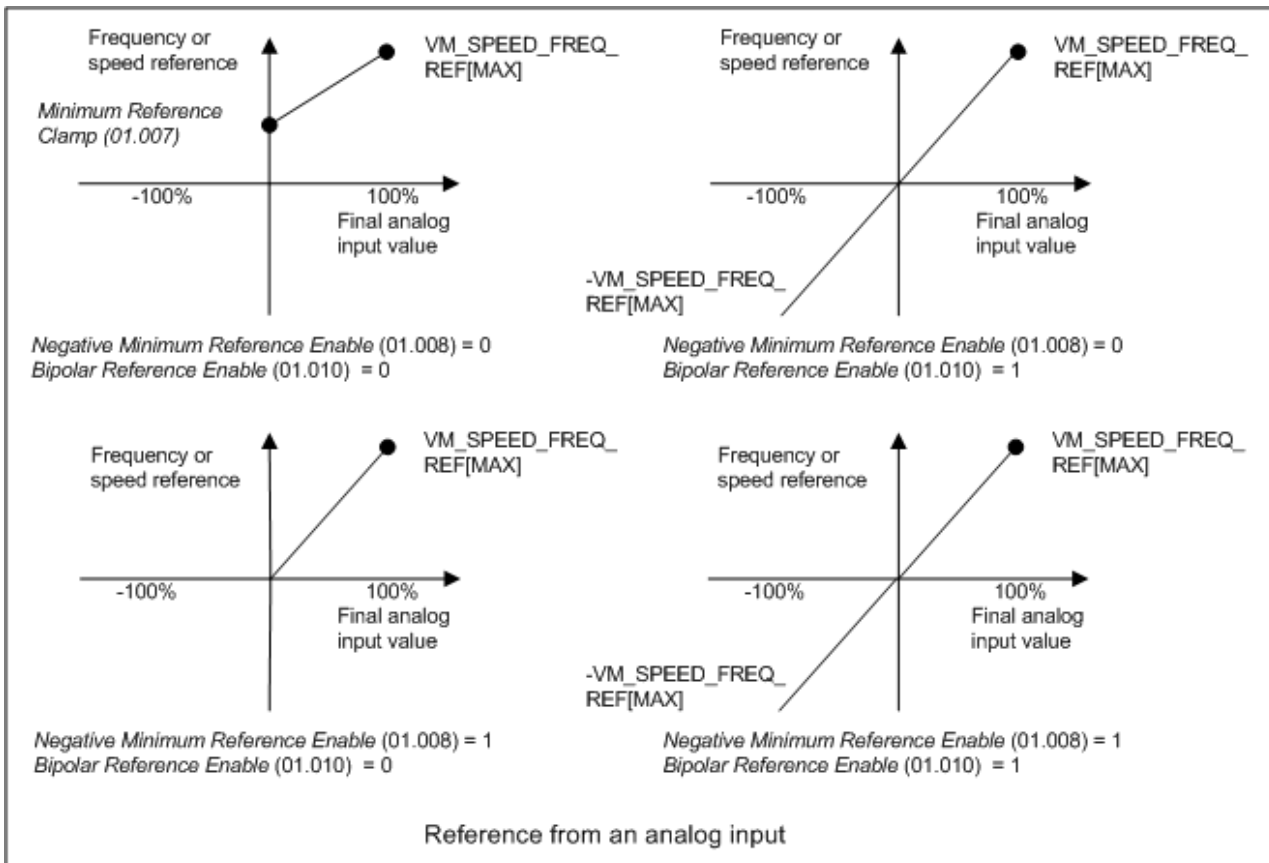

Parameter	01.035 Reference In Rejection Zone		
Short description	Displays when the reference is in 1 of the pre-defined rejection zones		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See Skip Reference 1 (01.029).

Parameter	01.036 Analog Reference 1		
Short description	Defines the relationship between the final value from analog 1 input and the frequency or speed reference		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_USER_REFS	Maximum	VM_SPEED_FREQ_USER_REFS
Default	0.00	Units	
Type	32 Bit Volatile	Update Rate	4ms read*
Display Format	Standard	Decimal Places	2
Coding	RO, VM, NC		

* A faster update rate of 250µs is possible for the speed reference from an analog input. See Menu 7 for details. Note that this parameter has higher resolution than other frequency parameters in Open-loop mode as this prevents loss of resolution when an analogue input is routed to this parameter with a typical drive output frequency range.

Analog Reference 1 (01.036) or Analog Reference 2 (01.037) should be used as the destinations for drive analog inputs when these provide the frequency or speed reference. The variable maximum/minimum applied to Analog Reference 1 (01.036) or Analog Reference 2 (01.037) gives the relationship shown below between the final value from the analog input and the frequency or speed reference.

Parameter	01.037 Analog Reference 2		
Short description	Defines the relationship between the final value from analog input 2 and the frequency or speed reference		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_USER_REFS	Maximum	VM_SPEED_FREQ_USER_REFS
Default	0.00	Units	
Type	32 Bit Volatile	Update Rate	4ms read*
Display Format	Standard	Decimal Places	2
Coding	RO, VM, NC		

* A faster update rate of 250µs is possible for the speed reference from an analog input. See Menu 7 for details. Note that this parameter has higher resolution than other frequency parameters in Open-loop mode as this prevents loss of resolution when an analogue input is routed to this parameter with a typical drive output frequency range.

See *Analog Reference 1* (01.036).

Parameter	01.038 Percentage Trim		
Short description	Defines the value of the reference trim as a percentage		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, NC		

See *Reference Offset Select* (01.009).

Parameter	01.039 Speed Feed-forwards		
Short description	Displays the value of the speed feed-forwards used by the standard motion controller		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, VM, ND, NC, PT		

Speed Feed-forwards (01.039) can be used by the Standard Motion Controller (Menu 13) to provide a speed feed-forwards term which uses the drive ramp system (Menu 2) to provide a speed profile. The speed feed-forwards is enabled with *Speed Feed-forwards Select* (01.040), which is controlled directly by the Standard Motion Controller.

Parameter	01.040 Speed Feed-forwards Select		
Short description	Indicates if the speed feed-forwards is being used by the standard motion controller		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Speed Feed-forwards* (01.039).

Parameter	01.041 Reference Select Flag 1		
Short description	Defines which reference is selected by the drive		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC

Default	0	Units	
Type	8 Bit User Save	Update Rate	Power-up read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Reset
1	Last
2	Preset

Power-up Keypad Control Mode Reference (01.051) defines the value written to Keypad Control Mode Reference (01.017) at power-up as given below.

Power-up Keypad Control Mode Reference (01.051)	Value written to Keypad Control Mode Reference (01.017) at power-up
0	0.0
1	The value in Keypad Control Mode Reference (01.017) at the previous power-down
2	The value saved in Preset Reference 1 (01.021)

Parameter	01.057 Force Reference Direction		
Short description	Defines the direction of the reference		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	Forward
2	Reverse

If Force Reference Direction (01.057) = 0 then it has no effect. If Force Reference Direction (01.057) is non-zero then the modulus of the reference is used and the sign is defined by the value of Force Reference Direction (01.057). If Force Reference Direction (01.057) = 1 then Pre-skip Filter Reference (01.002) is always positive, and if Force Reference Direction (01.057) = 2 then Pre-skip Filter Reference (01.002) is always zero or negative.

Menu 2 – Frequency Ramps

Mode: Open-Loop

Parameter	02.001 Post Ramp Reference		
Short description	Displays the output of the ramp system		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, VM, ND, NC, PT		

The *Post Ramp Reference* (02.001) is combined with the slip compensation frequency to define the output frequency of the drive. The *Post Ramp Reference* (02.001) is defined by the output of the ramp system except when the current limits are active (see Menu 4).

Parameter	02.003 Ramp Hold		
Short description	Set to 1 to hold the ramp system at its present value		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Ramp Hold* (02.003) = 0 the ramp system functions normally. If *Ramp Hold* (02.003) is set to 1 and *S Ramp Enable* (02.006) = 0 the ramp system output is held at its current level. If *Ramp Hold* (02.003) is subsequently set to 0 the ramp system output is released and continues to operate normally. If *S Ramp Enable* (02.006) = 1 when *Ramp Hold* (02.003) is set to 1 the acceleration will ramp towards zero and the frequency or speed will change in an S curve towards a constant speed. If a drive stop is requested (i.e. *Reference On* (01.011) = 0) the ramp hold function is disabled.

Parameter	02.004 Ramp Mode		
Short description	Defines the mode used by the ramp system		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	1	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Fast
1	Standard
2	Std boost

Acceleration is defined as a positive (forward) or negative (reverse) frequency or speed change away from zero, and deceleration is defined as a change towards zero. *Ramp Mode* (02.004) defines the ramp mode used for deceleration. During acceleration the frequency or speed changes are based on the final acceleration rate only.

0: Fast ramp

During deceleration the frequency or speed changes are based on the final deceleration rate.

1: Standard ramp

The standard ramp controller (shown in the diagram below) is only enabled when the *Pre-ramp Reference* (01.003) is closer to zero than the *Post Ramp Reference* (02.001), i.e. during deceleration. As the motor slows down power is fed into the d.c. bus of the drive which causes the voltage to rise. When the voltage reaches the level defined by the *Standard Ramp Voltage* (02.008) the d.c. bus voltage controller becomes active and provides a torque producing current reference. This system regulates the d.c. bus voltage to hold it at the level defined by the *Standard Ramp Voltage* (02.008). Generally as the motor slows down the deceleration needs to be increased to provide enough power to maintain the d.c. bus level. The frequency or speed is not allowed to fall faster than the final deceleration rate, and so a point is reached where the controller de-activates itself, and the final deceleration rate is used until the motor reaches standstill. If at any point the *Pre-ramp Reference* (01.003) is equal to or further from zero than the *Post Ramp Reference* (02.001), i.e. not decelerating, the d.c. bus voltage controller is de-activated.

2: Standard ramp with motor voltage boost

Standard ramp with motor voltage boost is the same as standard ramp mode except that the motor voltage is boosted by 20% to increase the motor losses and reduce the deceleration time.

If the *Standard Ramp Voltage* (02.008) is set to a level that is below the nominal d.c. bus voltage level the motor will coast during deceleration because the torque producing current reference is limited to prevent the motor from accelerating.

Parameter	02.006 S Ramp Enable		
Short description	Set to 1 to enable the use of S ramps		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *S Ramp Enable* (02.006) = 0 linear ramps are used, but if *S Ramp Enable* (02.006) = 1 an acceleration limit is applied to give S ramps. See *Maximum Rate Of Change Of Acceleration* (02.007) for more details of S ramps.

Parameter	02.007 <i>Maximum Rate Of Change Of Acceleration</i>		
Short description	Defines the maximum rate of change of acceleration used by the ramp system		
Mode	Open-Loop		
Minimum	0.0	Maximum	300.0
Default	3.1	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

A rate of change of acceleration ramp (S ramp) can be applied by different methods depending on the value of *S Ramp Set-up Mode* (02.041). If *S Ramp Set-up Mode* (02.041) = 0 then the maximum rate of change of acceleration in both directions, accelerating away from or towards zero, is defined by *Maximum Rate Of Change Of Acceleration* (02.007).

The general equations are given below for a linear ramp and S ramp where
 Δw is the required change of frequency or speed
 a_{Max} is the maximum allowed acceleration in units of frequency/s or speed/s
 J_{Max} is the maximum rate of change of acceleration (i.e. jerk) in units of frequency/s² or speed/s²

The time for a linear ramp to give a change of frequency or speed Δw is

$$T_{Linear} = \Delta w / a_{Max}$$

If an S ramp is used w_B is the change of frequency or speed as the acceleration changes from zero to a_{Max} , i.e. the S shaped part of the frequency or speed change.

$$w_B = a_{Max}^2 / 2J_{Max}$$

If the required frequency or speed change is less than $2w_B$, i.e. $\Delta w < 2w_B$, then the acceleration never reaches its limit and the ramp does not contain a linear ramp section and the time for the ramp is given by

$$T_{SRamp1} = 2 \sqrt{(\Delta w / J_{Max})}$$

Otherwise

$$T_{SRamp2} = (\Delta w / a_{Max}) + (a_{Max} / J_{Max})$$

The following is an example based on the default parameter values for Open-loop mode. The diagram below shows a change of frequency from 0Hz to 50Hz with the ramp rate set to 5.0s/100Hz and *Maximum Rate Of Change Of Acceleration* (02.007) set to its default value of 3.1s²/100Hz.

The required change of frequency $\Delta w = 50\text{Hz}$. The acceleration and jerk are converted from the parameter values as follows:

$$a_{\text{Max}} = 100 / \text{ramp rate} = 20.0\text{Hz/s}$$

$$J_{\text{Max}} = 100 / \text{Maximum Rate Of Change Of Acceleration (02.007)} = 32.3\text{Hz/s}^2$$

$$\text{The linear ramp time } T_{\text{Linear}} = \Delta w \times a_{\text{Max}} = 50.0 / 20.0 = 2.5\text{s}$$

$$\text{The frequency change for the acceleration to reach its limit } w_B = a_{\text{Max}}^2 / 2J_{\text{Max}} = 20.0^2 / (2 \times 32.3) = 6.19\text{Hz}$$

The required frequency change for $\Delta w = 50\text{Hz}$ and this is greater than $2w_B$, i.e. $\Delta w > 2 \times 6.19\text{Hz}$. Therefore the time for the ramp

$$T_{\text{SRamp2}} = (\Delta w / a_{\text{Max}}) + (a_{\text{Max}} / J_{\text{Max}}) = (50.0 / 20.0) + (20.0 / 32.3) = 2.5 + 0.62 = 3.12\text{s}$$

Note that the default value of *Maximum Rate Of Change Of Acceleration* (02.007) has been chosen so that when it is combined with the default acceleration rate, each of the S sections of the ramp is 20% of the overall time for the frequency change, i.e. $0.62/3.12 \times 100\% = 20\%$. This is the same as if *S Ramp Set-up Mode* (02.041) = 2 and *S Ramp Percentage* (02.040) = 20%.

If the required change of frequency had been 5.0Hz, i.e. less than $2 \times w_B$, then the alternative equation should be used:

$$T_{\text{SRamp1}} = 2 \sqrt{(\Delta w / J_{\text{Max}})} = 2 \sqrt{(5.0 / 32.3)} = 0.78\text{s}$$

For RFC-A and RFC-S modes the general equations are used in the same way as for Open-loop mode. The required values are calculated as follows:

$$\Delta w = 1000 / \text{ramp rate}$$

$$a_{\text{Max}} = 1000 / \text{ramp rate}$$

$$J_{\text{Max}} = 1000 / \text{Maximum Rate Of Change Of Acceleration (02.007)}$$

Parameter	02.008 Standard Ramp Voltage		
Short description	Defines the standard ramp voltage used by the ramp system		
Mode	Open-Loop		
Minimum	-VM_DC_VOLTAGE_SET	Maximum	VM_DC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Region	Default Value
200V	All	375
400V	50Hz	750
400V	60Hz	775
575V	All	895
690V	All	1075

See Ramp Mode (02.004).

Parameter	02.009 Deceleration Fail Detection Disable		
Short description	Set to 1 to disable the deceleration fail detection function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

In the following circumstances it is possible that the motor may not decelerated or even accelerate.

1. When standard ramp is selected with a high inductance supply it is possible for the d.c. bus voltage to rise as the motor speed approaches zero, and so the motor will continue to rotate slowly and not stop.
2. An overhauling load can cause the motor to accelerate.

It can be a problem if the drive state is changed to the "Decelerating" state and the motor does not stop. If *Deceleration Fail Detection Disable* (02.009) is at its default value of 0, the motor frequency or speed is monitored in the "Decelerating" state, and if this does not fall over a period of 10s the ramp output is forced to zero and the drive state is changed to "Stop" or "Inhibit" as appropriate.

If *Deceleration Fail Detection Disable* (02.009) = 1 this feature is disabled. This can be used in the following circumstances to prevent the system state from changing from the "Decelerating" state before the motor has stopped:

1. If S ramps are being used with long ramp rates, and the motor is still accelerating when the drive is changed to the "Decelerating" state because the run command is removed, then the ramp output may increase further before falling again towards zero.
2. In RFC-A or RFC-S modes the speed may appear not to reduce when very long ramp rates are used.

Parameter	02.010 Acceleration Rate Selector		
Short description	Defines which acceleration rate is used by the ramp system		
Mode	Open-Loop		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

The *Acceleration Rate Selector* (02.010) is used to either select an acceleration rate directly or to define the method used to select an acceleration rate. If $1 \leq \text{Acceleration Rate Selector (02.010)} \leq 8$ the acceleration rate is selected directly, i.e. 1 selects *Acceleration Rate 1* (02.011), 2 selects *Acceleration Rate 2* (02.012), etc. If *Acceleration Rate Selector* (02.010) = 0 the acceleration rate is selected with the acceleration rate select bits as shown in the table below.

Acceleration Rate Select Bit 2 (02.034)	Acceleration Rate Select Bit 1 (02.033)	Acceleration Rate Select Bit 0 (02.032)	Acceleration rate selected
0	0	0	Acceleration Rate 1 (02.011)
0	0	1	Acceleration Rate 2 (02.012)
0	1	0	Acceleration Rate 3 (02.013)
0	1	1	Acceleration Rate 4 (02.014)
1	0	0	Acceleration Rate 5 (02.015)
1	0	1	Acceleration Rate 6 (02.016)
1	1	0	Acceleration Rate 7 (02.017)
1	1	1	Acceleration Rate 8 (02.018)

If *Acceleration Rate Selector* (02.010) = 9 the acceleration rate is selected based on the value of *Preset Selected Indicator* (01.050), i.e. 1 selects *Acceleration Rate 1* (02.011), 2 selects *Acceleration Rate 2* (02.012), etc.

Parameter	02.011 Acceleration Rate 1		
Short description	Defines the acceleration rate present in acceleration rate 1		
Mode	Open-Loop		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

Acceleration Rate 1 (02.011) to *Acceleration Rate 8* (02.018) can be selected to define the linear ramp rate. The acceleration rate applies when the frequency/speed is changing away from zero.

Selecting a ramp rate that has been set to zero in Open-loop mode disables the ramp system so that the *Post Ramp Reference* (02.001) follows the *Pre-ramp Reference* (01.003) without any delay for acceleration or deceleration. It should be noted that this also disables the standard ramp d.c. link voltage controller and the frequency based current limits.

The units of *Acceleration Rate 1* (02.011) to *Acceleration Rate 8* (02.018) are s / Ramp rate frequency or s / Ramp rate speed. See *Ramp Rate Units* (02.039) for the definition of Ramp rate frequency and Ramp rate speed.

Parameter	02.012 Acceleration Rate 2		
Short description	Defines the acceleration rate present in acceleration rate 2		
Mode	Open-Loop

The *Jog Acceleration Rate* (02.019) is selected when *Jog Select* (01.013) is active and when the frequency/speed is changing away from zero in either direction. The units of *Jog Acceleration Rate* (02.019) are s / Ramp rate frequency or s / Ramp rate speed. See *Ramp Rate Units* (02.039) for the definition of Ramp rate frequency and Ramp rate speed.

Parameter	02.020 Deceleration Rate Selector		
Short description	Defines which deceleration rate is used by the ramp system		
Mode	Open-Loop		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

The *Deceleration Rate Selector* (02.020) operates in the same way as the *Acceleration Rate Selector* (02.010). If *Deceleration Rate Selector* (02.020) = 0 the deceleration rate is selected with the deceleration rate select bits as shown in the table below.

Deceleration Rate Select Bit 2 (02.037)	Deceleration Rate Select Bit 1 (02.036)	Deceleration Rate Select Bit 0 (02.035)	Deceleration rate selected
0	0	0	<i>Deceleration Rate 1</i> (02.021)
0	0	1	<i>Deceleration Rate 2</i> (02.022)
0	1	0	<i>Deceleration Rate 3</i> (02.023)
0	1	1	<i>Deceleration Rate 4</i> (02.024)
1	0	0	<i>Deceleration Rate 5</i> (02.025)
1	0	1	<i>Deceleration Rate 6</i> (02.026)
1	1	0	<i>Deceleration Rate 7</i> (02.027)
1	1	1	<i>Deceleration Rate 8</i> (02.028)

Parameter	02.021 Deceleration Rate 1		
Short description	Defines the deceleration rate present in deceleration rate 1		
Mode	Open-Loop		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	10.0	Units	s
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

Deceleration Rate 1 (02.021) to *Deceleration Rate 8* (02.028) can be selected to define the linear ramp rate. The deceleration rate applies when the frequency/speed is changing towards zero.

Selecting a ramp rate that has been set to zero in Open-loop mode disables the ramp system so that the *Post Ramp Reference* (02.001) follows the *Pre-ramp Reference* (01.003) without any delay for acceleration or deceleration. It should be noted that this also disables the standard ramp d.c. link voltage controller and the frequency based current limits.

The units of *Deceleration Rate 1* (02.021) to *Deceleration Rate 8* (02.028) are s / Ramp rate frequency or s / Ramp rate speed. See *Ramp Rate Units* (02.039) for the definition of Ramp rate frequency and Ramp rate speed.

Parameter	02.022 Deceleration Rate 2		
Short description	Defines the deceleration rate present in deceleration rate 2		
Mode	Open-Loop		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE

Mode	Open-Loop		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	0.2	Units	s
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

The *Jog Deceleration Rate* (02.029) is selected when *Jog Select* (01.013) is active and when the frequency/speed is changing towards zero in either direction. It should be noted that when jog is selected and the drive run is de-activated *Jog Deceleration Rate* (02.029) is used to decelerate the motor to stop. The units of *Jog Deceleration Rate* (02.029) are s / Ramp rate frequency or s / Ramp rate speed. See *Ramp Rate Units* (02.039) for the

definition of Ramp rate frequency and Ramp rate speed.

Parameter	02.030 Acceleration Rate Selected		
Short description	Indicates which acceleration rate is selected		
Mode	Open-Loop		
Minimum	0	Maximum	8
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Acceleration Rate Selected (02.030) shows a value between 1 and 8 that corresponds to parameters 02.011 to 02.018 indicating which of these acceleration rates is actually being used.

Parameter	02.031 Deceleration Rate Selected		
Short description	Indicates which deceleration rate is selected		
Mode	Open-Loop		
Minimum	0	Maximum	8
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Deceleration Rate Selected (02.031) shows a value between 1 and 8 that corresponds to parameters 02.021 to 02.028 indicating which of these deceleration rates is actually being used.

Parameter	02.032 Acceleration Rate Select Bit 0		
Short description	Defines which acceleration rate is used if acceleration rate selector = 0		
Mode	Open-Loop

Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Deceleration Rate Selector* (02.020).

Parameter	02.037 <i>Deceleration Rate Select Bit 2</i>		
Short description	Defines which deceleration rate is used if deceleration rate selector = 0		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Deceleration Rate Selector* (02.020).

Parameter	02.039 <i>Ramp Rate Units</i>		
Short description	Defines the units used by the ramp system		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

The ramp rate parameters (*Acceleration Rate 1* (02.011) to *Acceleration Rate 8* (02.018), *Jog Acceleration Rate* (02.019), *Deceleration Rate 1* (02.021) to *Deceleration Rate 8* (02.028) and *Jog Deceleration Rate* (02.029)) are specified in s / Ramp rate frequency for Open-loop mode and s / Ramp rate speed for RFC-A and RFC-S modes. Ramp rate frequency and Ramp rate speed are selected with *Ramp Rate Units* (02.039) as defined in the table below.

Ramp Rate Units (02.039)	Open-loop Ramp rate frequency	RFC-A and RFC-S mode Ramp rate speed
0	100Hz	1000rpm or 1000mm/s
1	Maximum frequency	Maximum speed

Maximum frequency and Maximum speed are defined by *Maximum Reference Clamp* (01.006) if *Select Motor 2 Parameters* (11.045) = 0, or *M2 Maximum Reference Clamp* (21.001) if *Select Motor 2 Parameters* (11.045) = 1.

Parameter	02.040 <i>S Ramp Percentage</i>		
Short description	Defines the profile of the S ramp system as a percentage		
Mode	Open-Loop		
Minimum	0.0	Maximum	50.0
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

If *S Ramp Set-up Mode* (02.041) = 1 the percentage of the ramp to Maximum frequency or Maximum speed that includes half the S ramp profile can be specified with *S Ramp Percentage* (02.040) as shown in the diagram below. If motor map one is active (i.e. *Select Motor 2 Parameters* (11.045) = 0), the acceleration or deceleration times are defined by *Acceleration Rate 1* (02.011) and *Deceleration Rate 1* (02.021) respectively irrespective of which ramps rates are selected. The maximum frequency/speed is defined by *Maximum Reference Clamp* (01.006). The time for the frequency/speed change remains constant at the time defined by the acceleration or deceleration rate, and so as the percentage S ramp is changed the maximum acceleration is modified automatically. If motor map 2 is selected then *M2 Maximum Reference Clamp* (21.001), *M2 Acceleration Rate 1* (21.004) and *M2 Deceleration Rate 1* (21.005) are used to define the ramp profile. It should be noted that for ramp times to the maximum speed/frequency exceeding 30s this system becomes less accurate and the ramp time may become shorter than expected.

Parameter	02.041 S Ramp Set-up Mode		
Short description	Defines the mode used by the S ramp system		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Single
1	Percentage
2	Independent

S Ramp Set-up Mode (02.041) defines the method used to set up the S ramp function.

0: Single maximum rate of change of acceleration

The maximum rate of change of acceleration in either direction, when the frequency/speed is changing away from or towards zero, is defined by *Maximum Rate Of Change Of Acceleration* (02.007).

1: Percentage

A single maximum rate of change of acceleration is used in either direction, when the frequency/speed is changing away from or towards zero, but this is specified as the percentage of the ramp from zero to Maximum frequency or Maximum speed which is covered by the S shaped profile. See *S Ramp Percentage* (02.040).

2: Independent maximum rate of change of acceleration values

The maximum rate of change of acceleration can be specified as four independent values. See *Maximum Rate Of Change Of Acceleration 1* (02.042).

Parameter	02.042 Maximum Rate Of Change Of Acceleration 1		
Short description	Defines the 1st maximum rate of change of acceleration used by the S ramp system		
Mode	Open-Loop		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

If *S Ramp Set-up Mode* (02.041) = 2 it is possible to set up four independent maximum rate of change of acceleration values as shown in the diagram below. The values from 1 to 4 correspond to *Maximum Rate Of Change Of Acceleration 1* (02.042) to *Maximum Rate Of Change Of Acceleration 4* (02.045) respectively.

Parameter	02.043 Maximum Rate Of Change Of Acceleration 2		
Short description	Defines the 2nd maximum rate of change of acceleration used by the S ramp system		
Mode	Open-Loop		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *Maximum Rate Of Change Of Acceleration 1* (02.042).

Parameter	02.044 Maximum Rate Of Change Of Acceleration 3		
Short description	Defines the 3rd maximum rate of change of acceleration used by the S ramp system		
Mode	Open-Loop		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *Maximum Rate Of Change Of Acceleration 1* (02.042).

Parameter	02.045 Maximum Rate Of Change Of Acceleration 4		
Short description	Defines the 4th maximum rate of change of acceleration used by the S ramp system		
Mode	Open-Loop		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW

Menu 3 – Frequency Slaving and Position Feedback

Mode: Open-Loop

Position feedback interfaces

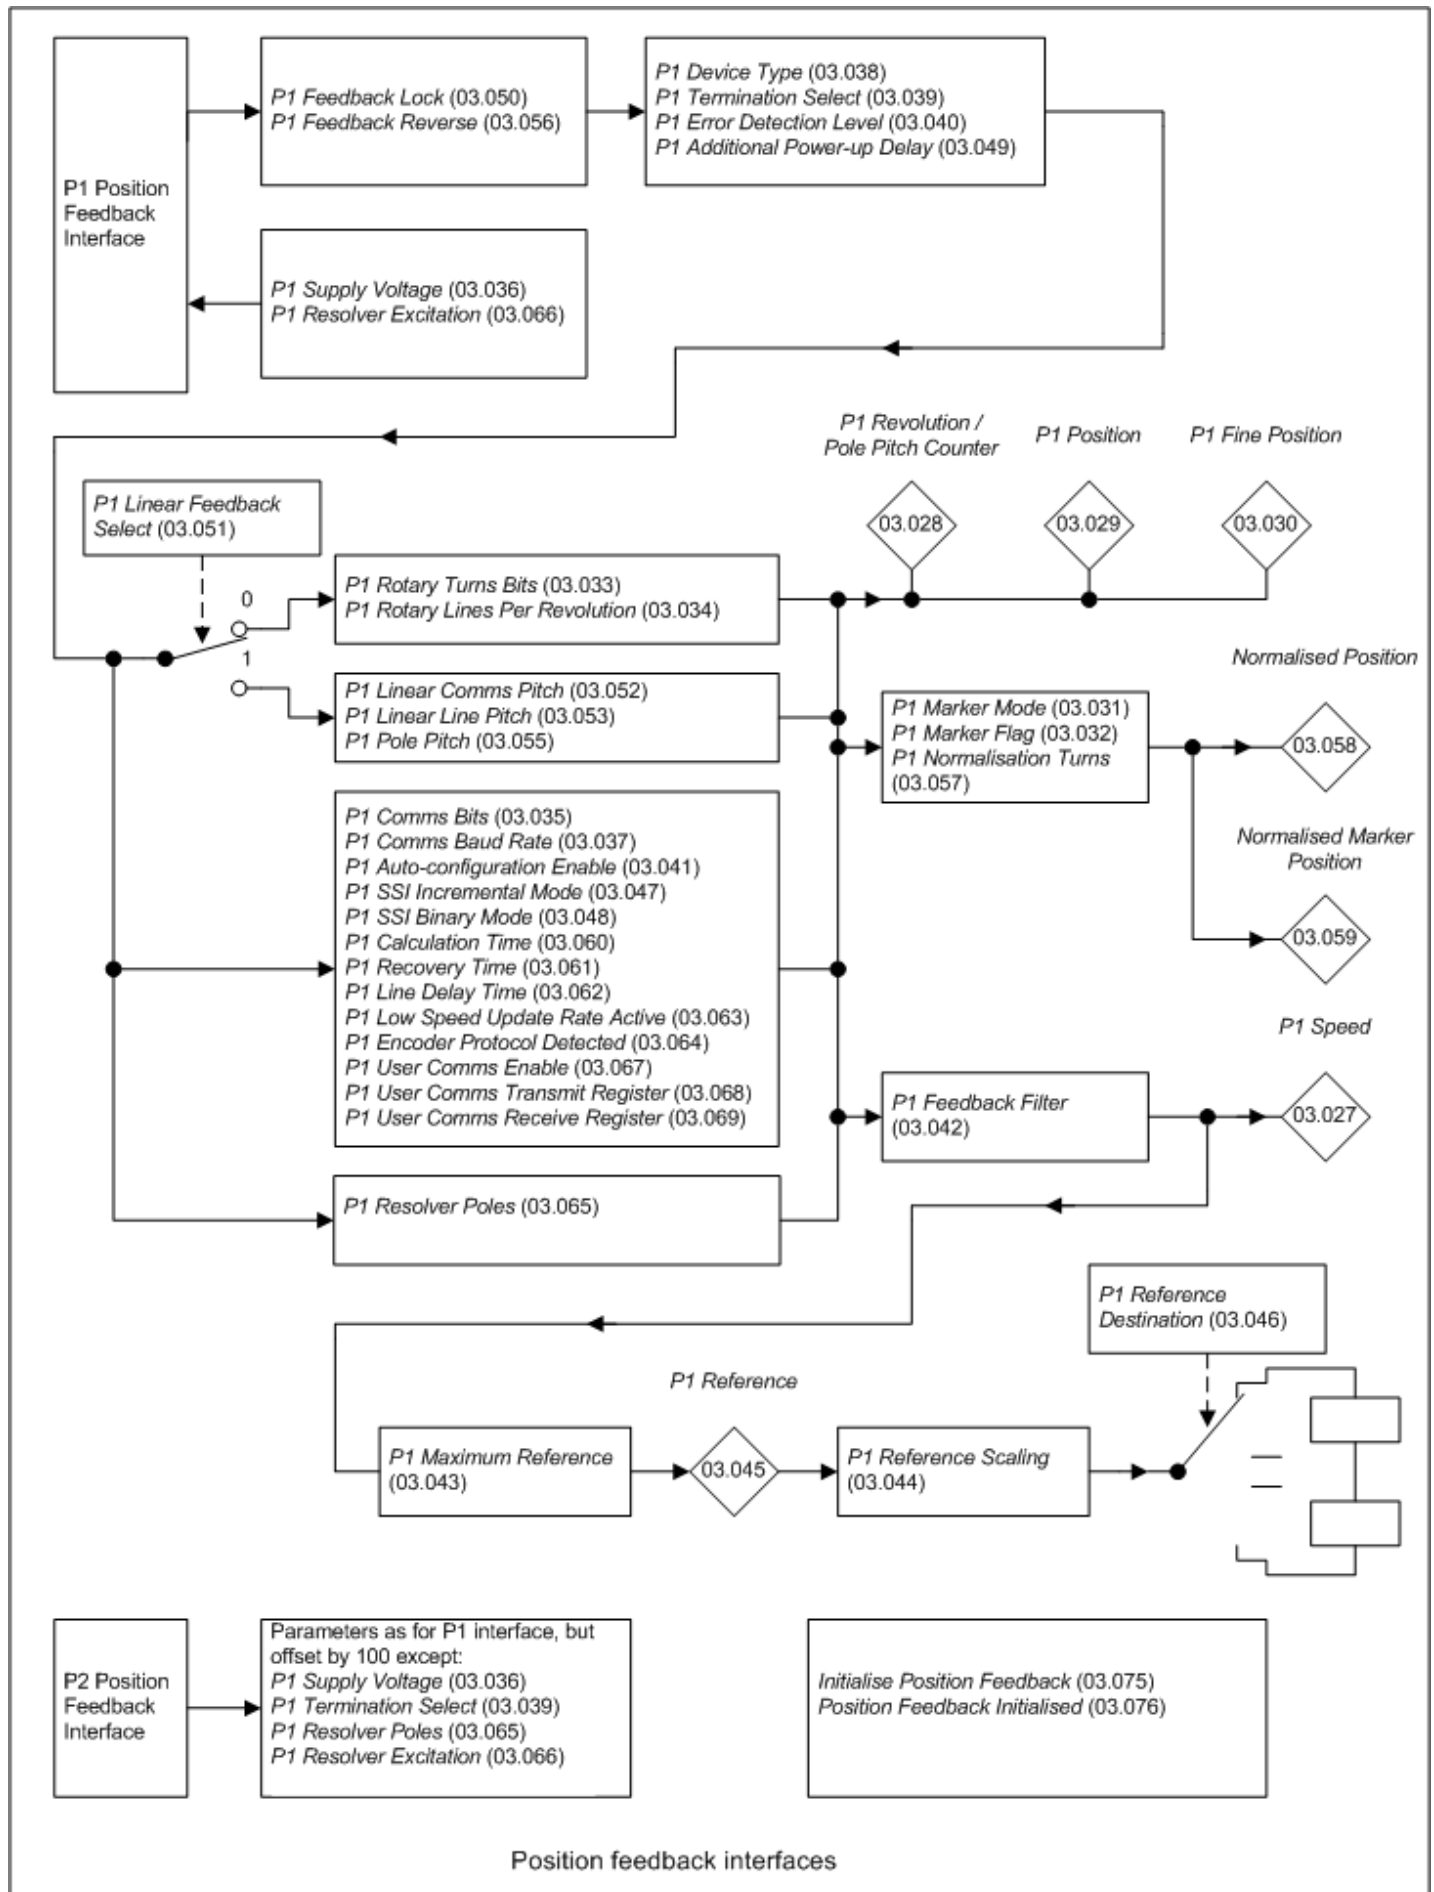

Two position feedback interfaces with associated freeze system are provided. Access to both these interfaces and the encoder simulation output are provided via one 15 way high density connector. There are limitations on the functions that can be provided simultaneously as shown in the table below along with the connections required for each combination of functions.

Functions			Connections							
P1 Position feedback interface	P2 Position feedback interface	Encoder Simulation Output	1/2	3/4	5/6	7/8	9/10	11/12	13/14	15
AB Servo FD Servo FR Servo			A1	B1	Z1	U1	V1	W1	PS1	Th

The marker inputs can be used without their associated position feedback as freeze trigger inputs, therefore these are present where possible even if the associated incremental or SINCOS position feedback is not possible. The table below gives the connection functions associated with the codes used.

Connection Function	Connection Definition
<i>Position Interface inputs</i>	
A	A input for AB, or AB Servo encoders F input for FD, FD Servo, FR or FR Servo encoders
B	B input for AB, or AB Servo encoders D input for FD or FD Servo encoders R input for FR or FR Servo encoders
Z	Z input for AB, AB Servo, FD, FD Servo, FR, FR Servo, SC encoders Freeze input
U, V, W	Commutation signals for AB Servo, FD Servo, FR Servo, SC Servo or Commutation Only encoders
Cos, Sin	Cosine and Sine inputs for SC, SC EnDat, SC BiSS, SC Hiperface, SC SSI or SC Servo encoders Cosine and Sine inputs for resolvers
Ref	Reference output for resolvers
D	Data input/output for SC EnDat, SC BiSS, SC Hiperface, EnDat or BiSS encoders Data input for SC SSI, SSI encoders
Clk	Clock output for SC EnDat, SC SSI, EnDat, BiSS or SSI encoders
SCs, SSn	Single turn Cosine and Sine signals used to determine the absolute position within one turn
<i>Encoder Simulation Output</i>	
AOut	A output for AB or AB Lock modes F output for FD, FD Lock or FR modes Data output for SSI Gray or SSI Binary modes
BOut	B output for AB or AB Lock modes D output for FD, FD Lock or FR modes Clock input for SSI Gray or SSI Binary modes
Zout	Z output for AB, AB Lock, FD, FD Lock or FR modes
<i>Power Supply and Temperature Measurement</i>	
PS1	Power supply output (13 = Supply, 14 = 0V)
Th	Temperature measurement input

P1 Position feedback interface

P2 Position feedback interface

The P2 position feedback interface duplicates most of the parameter structure and functions of the P1 feedback interface. The P2 interface parameters (03.127 to 03.169) have the same functions as the P1 interface parameters (03.027 to 03.069) except that parameters 03.136, 03.139, 03.162 and 03.163 are not included because the P2 interface does not have its own position feedback power supply, does not support resolvers, and the termination resistors are not selectable and are always enabled. Also *P2 Device type* (03.138) has less possible settings because the P2 interface does not support all the devices supported by the P1 interface.

Priority of the 15-way D-type is assigned in the following order from the highest priority to the lowest.

1. P1 position interface
2. Encoder simulation output
3. P2 position interface

The availability of the P2 position interface on the 15-way D-type on the drive is dependent on type of feedback device selected in *P1 Device Type* (03.038) and the encoder simulation mode selected in *Encoder Simulation Mode* (03.088). *P2 Status* (03.172) shows the status of the P2 position interface depending on the settings in *P2 Device type* (03.138), *P1 Device Type* (03.038), and *Encoder Simulation Mode* (03.088).

Position feedback initialisation

Position feedback devices need to be initialised before they can provide position feedback information. For details of the initialisation required for each type of device see *Position Feedback Initialized* (03.076). The user can force all position feedback devices connected directly to the drive or to an option module to be initialised (see *Initialise Position Feedback* (03.075)). The drive also automatically initialises all position feedback devices connected to the drive position feedback interfaces immediately after power-up. An attempt is made to initialise any position feedback device that needs to be initialised when a drive reset occurs. This would happen inherently if the drive is tripped and the drive is reset to clear the trip.

It should be noted that the initialised bit for any position feedback interface in *Position Feedback Initialized* (03.076) is set to zero if any of the parameters given below are changed if they could be used by the position feedback device whether rotary or linear. If the parameter could not be used by the device then it remains initialised when the parameter is changed. The initialisation bit for a position feedback device is also set to zero if the number of motor poles parameter for the active motor is changed. If the device becomes uninitialised because of a parameter change then an *Encoder 7* trip will occur.

Encoder Simulation Output

Freeze System

The drive has two freeze functions that can capture the position from either the P1 or P2 position interface in the drive when a freeze trigger event occurs. A common freeze logic system is also provided, so that the freeze trigger events can be combined either to trigger the freeze system in the drive or to generate a freeze trigger for option modules. The freeze system is shown in the diagram below.

Position feedback interface thermistor input

Parameter	03.001 Frequency Slaving Demand		
Short description	Shows the fundamental drive output frequency when frequency slaving is enabled		
Mode	Open-Loop		
Minimum	-1000.0	Maximum	1000.0
Default		Units	Hz
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, ND, NC, PT		

Frequency Slaving Demand (03.001) shows the fundamental drive output frequency when frequency slaving is enabled (*Enable Frequency Slaving* (03.013) = 1), otherwise it is always 0.0.

Frequency slaving mode is used to lock the fundamental frequency produced by the drive with an external frequency applied to the P1 position feedback input. Frequency slaving can be used to keep the shafts of two synchronous machines in lock by feeding the frequency slaving output from the master drive into the position feedback input of the slave drive. Alternatively the two machines could be operated so that the shafts rotate with an exact ratio, i.e. as though the shafts were connected by gears (see *Slaving Ratio Numerator* (03.014) and *Slaving Ratio Denominator* (03.015)). The source for frequency slaving mode may be quadrature AB signals or FD (frequency and direction) signals. The P1 position feedback interface must be set up to match the source signal type. The P1 position feedback interface does not need to be set up for the number of lines per revolution for the device as the pulses are taken directly from the interface and only scaled with the slaving ratio. If a 1024 line AB device is used (which corresponds to the default set up for the encoder simulation output) then one revolution of the device will correspond to one revolution of the output voltage vector. The drive does not count pulses whilst it is disabled (*Frequency Slaving Demand* (03.001) shows 0.0), but it does maintain lock once enabled even if the direction of rotation changes. In frequency slaving mode the drive current limits are not active, however, the current magnitude limit is active and will try and limit the drive current by modifying the output voltage. If synchronous machines are used and the current required exceeds the drive magnitude limit the slave machine will pole slip.

Parameter	03.005 Zero Speed Threshold		
Short description	Set to the required zero speed threshold		
Mode	Open-Loop		
Minimum	0.0	Maximum	20.0
Default	1.0	Units	Hz
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

If the *Post Ramp Reference* (02.001) is at or below the level defined by this parameter in either direction *Zero Speed* (10.003) = 1, otherwise *Zero Speed* (10.003) = 0.

Parameter	03.006 At Speed Lower Limit		
Short description	Set to the required minimum at speed threshold		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	1.0	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

At Speed (10.006) is set if the *Post Ramp Reference* (02.001) is on the boundaries or within the at speed window. *Above Set Speed* (10.007) and *Below Set Speed* (10.005) are set if the reference is above or below the window respectively.

If *Absolute At Speed Select* (03.009) = 0 reference window mode is used.
The "at speed" condition is true if,

$$(|\text{Pre-ramp Reference (01.003)}| - \text{At Speed Lower Limit (03.006)}) \leq |\text{Post Ramp Reference (02.001)}| \leq (|\text{Pre-ramp Reference (01.003)}| + \text{At Speed Upper Limit (03.007)})$$

(If the lower limit is less than zero then zero is used as the lower limit.)

If *Absolute At Speed Select* (03.009) = 1 absolute window mode is used.
The "at speed" condition is true if,

$$\text{At Speed Lower Limit (03.006)} \leq |\text{Post Ramp Reference (02.001)}| \leq \text{At Speed Upper Limit (03.007)}$$

Parameter	03.007 At Speed Upper Limit		
Short description	Set to the required maximum at speed threshold		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	1.0	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *At Speed Lower Limit* (03.006).

Parameter	03.008 Over Speed Threshold		
Short description	Set to the required over speed threshold		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	0.0	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

If *Over Speed Threshold* (03.008) is set to a non-zero value it defines the over speed threshold. If the *Post Ramp Reference* (02.001) exceeds this threshold in either direction an *Over Speed* trip is produced. If *Over Speed Threshold* (03.008) is set to 0.0 the threshold is based on the variable minimum/maximum for the references and is equal to 1.2 x VM_SPEED_FREQ_REF[MAX].

Parameter	03.009 Absolute At Speed Select		
Short description	Indicates when the motor is running at speed		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *At Speed Lower Limit* (03.006).

Parameter	03.013 Enable Frequency Slaving		
Short description	Set to 1 to enable frequency slaving		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Enable Frequency Slaving (03.013) can be used to enable or disable frequency slaving even when the drive is enabled. The change from slaving to

normal operation will result in the frequency ramping from the slaving frequency to the demanded frequency using whichever ramp rate that is applicable to normal operation. The change from normal operation to slaving will result in an instantaneous change to the slaving frequency. Therefore the slaving frequency should be similar to the demanded frequency before the change is made.

Parameter	03.014 Slaving Ratio Numerator		
Short description	Defines the numerator of the slaving ratio		
Mode	Open-Loop		
Minimum	0.000	Maximum	1.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

The slave frequency input can be scaled before it defines the *Frequency Slaving Demand* (03.001) using *Slaving Ratio Numerator* (03.014) and *Slaving Ratio Denominator* (03.015). The numerator and denominator can be adjusted whilst the drive is running without causing jumps in angle. However, if the change in ratio causes a large change in frequency, the transient current could activate the current magnitude limit or trip the drive.

Parameter	03.015 Slaving Ratio Denominator		
Short description	Defines the denominator of the slaving ratio		
Mode	Open-Loop		
Minimum	0.001	Maximum	1.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Slaving Ratio Numerator* (03.014).

Parameter	03.016 Reference Frame Angle		
Short description	Displays the reference frame angle as a value from 0 to 65535 corresponding to one period of the drive output frequency		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The frequency slaving output is generated using the encoder simulation system from the reference frame that defines the drive output voltage angle. *Reference Frame Angle* (03.016) gives the reference frame angle as a value from 0 to 65535 corresponding to one period of the drive output frequency and should be used as the source for the encoder simulation system (i.e. *Encoder Simulation Source* (03.085) = 3.016) to provide a frequency slaving output. The encoder simulation output system set-up parameters can be used to set up the ratio between the reference frame frequency and the encoder simulation frequency and the format of the output signals. With the default values an AB type output is produced that gives a frequency that is 1024 times the drive output frequency.

Parameter	03.027 P1 Speed Feedback		
Short description	Displays the speed feedback from device P1		
Mode	Open-Loop		
Minimum	-VM_SPEED	Maximum	VM_SPEED
Default		Units	
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

Provided the set-up parameters for the position feedback device connected to the drive P1 position interface are correct *P1 Speed Feedback* (03.027) shows the speed derived from the feedback. The speed is given in mm/s if *P1 Linear Feedback Select* (03.051) = 1 and *Linear Speed Select* (01.055) = 1, otherwise it is given in rpm. The value shown is measured over a 16ms sliding window period, and so the ripple in this value is as defined for *Speed Feedback* (03.002).

Parameter	03.028 P1 Revolution/Pole Pitch Counter		
Short description	Displays the revolution/pole pitch counter from device P1		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

P1 Revolution/Pole Pitch Counter (03.028), *P1 Position* (03.029) and *P1 Fine Position* (03.030) combined give the encoder position with a resolution of $1/2^{32}$ of a revolution/pole pitch as a 48 bit number. If a rotary position feedback device is being used (*P1 Linear Feedback Select* (03.051) = 0) then these quantities relate directly to the rotary position of the feedback device. If a linear feedback device is used then one revolution or pole pitch relates to the distance given by *P1 Pole Pair Pitch* (03.055).

Bit	Effect of setting bit to one
0	No action is taken unless the marker flag is zero before the marker event occurs
1	<i>P1 Revolution/Pole Pitch Counter</i> (03.028) and the whole of <i>P1 Normalised Position</i> (03.058) are also set to zero on a marker event
2	<i>P1 Revolution/Pole Pitch Counter</i> (03.028), <i>P1 Position</i> (03.029), <i>P1 Fine Position</i> (03.030) and the related part of <i>P1 Normalised Position</i> (03.058) are not reset. (This overrides bit 1.) <i>P1 Normalised Position</i> (03.058) is transferred to <i>P1 Normalised Marker Position</i> (03.059) and <i>P1 Marker Flag</i> (03.032) is set to one.
3	If this bit is 0 the state of the marker is only undefined when the differential input is in the range from -200mV to 200mV. The marker pulse is only guaranteed to be recognised if it is at least 500ns wide. This setting is used for most encoders with standard level marker pulses. If this bit is set to 1 the undefined state region is reduced to the range from -30mV to 30mV. The marker pulse is only guaranteed to be recognised if it is at least 10us wide. The smaller undefined region is required for position feedback devices that produce a small marker pulse, such as the Heidenhain ERN1387 encoder. Note that the reduced undefined region is only provided for position feedback interface P1 and that this bit in <i>P2 Marker Mode</i> (03.131) has no effect.

The marker input can be used for a standard type marker function or alternatively it can be used as an additional freeze input for the P1 position feedback interface.

P1 Device Type (03.038): SC, SC Servo, SC SC

The marker function operates in the same way as for the digital incremental encoders. The resolution of the marker actions is only as accurate as the zero crossings of the sine waves. The marker is used with an SC SC type device to trim the absolute position derived from the single sine wave per turn channels once after initialisation. Until this is done (i.e. the marker has been active once after initialisation) marker events will not be registered.

P1 Device Type (03.038): Any other device type

The marker function cannot be used and *P1 Marker Mode* (03.031) has no effect.

Parameter	03.032 P1 Marker Flag		
Short description	Indicates when a marker event occurs		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

P1 Marker Flag (03.032) is set to one when a marker event occurs. The flag must be cleared by the user.

Parameter	03.033 P1 Rotary Turns Bits		
Short description	Defines the number of rotary turns bits for device P1		
Mode	Open-Loop		
Minimum	0	Maximum	16
Default	16	Units	
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Rotary Turns Bits (03.033) normally only has any effect if the position feedback interface is being used with a rotary device (i.e. *P1 Linear Feedback Select* (03.051) = 0).

P1 Device Type (03.038): SC Hiperface, SC EnDat, SC SSI, EnDat, BiSS, SSI, SC BiSS

P1 Rotary Turns Bits (03.033) is used to determine the number of bits within the comms messages from the position feedback device that represent turns. For a single turn encoder *P1 Rotary Turns Bits* (03.033) must be set to zero. The most significant bits in *P1 Revolution/Pole Pitch Counter* (03.028) that are not included in the turns information provided by the encoder comms are held at zero. If *P1 Rotary Turns Bits* (03.033) = 0 (single turn encoder) the whole of *P1 Revolution/Pole Pitch Counter* (03.028) is held at zero. The number of bits of position information within one revolution for a rotary device are calculated from *P1 Rotary Turns Bits* (03.033) and *P1 Comms Bits* (03.035). If the resulting value is greater than 32 it is limited to 32.

Some SSI encoders include leading zeros before the turns information and in this case the number of turns bits should include the leading zeros. Some BiSS encoders include zero padding either before or after the turns information (see *P1 Additional Configuration* (03.074)). *P1 Rotary Turns Bits* (03.033) should include the actual turns bits and the additional padding.

P1 Device Type (03.038): Option Slot 1, Option Slot 2, Option Slot 3, Option Slot 4

Whatever the setting for *P1 Linear Feedback Select* (03.051) the number of rotary turns bits should be set up to indicate how many turns bits there are in the position provided by an option module. See *P1 Device Type* (03.038) for more details.

P1 Device Type (03.038): Any other device type

It is sometimes desirable to mask off the most significant bits of *P1 Revolution/Pole Pitch Counter* (03.028), but this does not have to be done for the drive to function correctly. If *P1 Rotary Turns Bits* (03.033) = 0 the whole of *P1 Revolution/Pole Pitch Counter* (03.028) is held at zero. If *P1 Rotary Turns Bits* (03.033) has any other value it indicates the number of bits in *P1 Revolution/Pole Pitch Counter* (03.028) that are not held at zero. For example, if *P1 Rotary Turns Bits* (03.033) = 5, then *P1 Revolution/Pole Pitch Counter* (03.028) counts up to 31 before being reset.

The description above is for normal operation when *P1 Absolute Turns Recovery Enable* (03.073) = 0. If *P1 Absolute Turns Recovery Enable* (03.073) = 1 no masking is applied to *P1 Rotary Turns Bits* (03.033), and so a 16 bit value is always shown.

Parameter	03.034 <i>P1 Rotary Lines Per Revolution</i>		
Short description	Defines the number of rotary lines per revolution for device P1		
Mode	Open-Loop		
Minimum	1	Maximum	100000
Default	1024	Units	
Type	32 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Rotary Lines Per Revolution (03.034) only has any effect if the position feedback interface is being used with a rotary device (i.e. *P1 Linear Feedback Select* (03.051) = 0).

***P1 Device Type* (03.038): AB, AB Servo**

P1 Rotary Lines Per Revolution (03.034) should be set to the number of lines per revolution for the encoder connected to the P1 position feedback interface.

***P1 Device Type* (03.038): FD, FR, FD Servo, FR Servo**

P1 Rotary Lines Per Revolution (03.034) should be set to the number of lines per revolution for the encoder connected to the P1 position feedback interface divided by 2.

***P1 Device Type* (03.038): SC, SC Servo, SC Hiperface, SC EnDat, SC SSI, SC SC, SC BiSS**

P1 Rotary Lines Per Revolution (03.034) should be set to the number of sine waves per revolution for the encoder connected to the P1 position feedback interface.

***P1 Device Type* (03.038): Any other device type**

P1 Rotary Lines Per Revolution (03.034) has no effect.

Parameter	03.035 <i>P1 Comms Bits</i>		
Short description	Defines the total number of bits of position information in the comms message from the encoder for device P1		
Mode	Open-Loop		
Minimum	0	Maximum	48
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

***P1 Device Type* (03.038): SC Hiperface, EnDat, SC EnDat**

Total number of bits of position information in the comms message from the encoder.

***P1 Device Type* (03.038): SSI, SC.SSI**

Total number of bits of position information in the comms message from the encoder including any leading or trailing zeros and the power supply alarm bit if present.

***P1 Device Type* (03.038): BiSS, SC BiSS**

Total number of bits of position information in the comms message from the encoder excluding the warning and error bits. It is always assumed there is one warning bit and one error bit. The length of the position information includes any zero padding that is included by the encoder. The CRC is applied to the whole message including the error (/E) and warning (/W) bits. The warning bit is ignored, but if the error bit is low then an *Encoder 6* trip is initiated.

***P1 Device Type* (03.038): Any other device type**

P1 Comms Bits (03.035) has no effect.

Parameter	03.036 <i>P1 Supply Voltage</i>		
Short description	Defines the supply voltage output for device P1		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	5V
1	8V
2	15V

P1 Supply Voltage (03.036) sets the level for the supply voltage output. To ensure that the maximum voltage for the position feedback device is not accidentally exceeded, the device should be disconnected from the drive when the level is being adjusted.

Parameter	03.037 <i>P1 Comms Baud Rate</i>		
Short description	Defines the baud rate used for encoder communications		
Mode	Open-Loop		
Minimum	0	Maximum	8
Default	2	Units	Baud
Type	8 Bit User Save	Update Rate	Background read, Auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	100k
1	200k
2	300k
3	400k
4	500k
5	1M
6	1.5M
7	2M
8	4M

P1 Comms Baud Rate (03.037) defines the baud rate used for encoder communications. Restrictions are applied to the baud rate for different feedback devices, and so the baud rate may be different to the parameter value.

***P1 Device Type* (03.038): SC.Hiperface**

A fixed baud rate of 9600 baud is always used with this type of encoder so *P1 Comms Baud Rate* (03.037) has no effect.

***P1 Device Type* (03.038): SC.SSI, SC EnDat, SC BiSS**

Any baud rate that is within the range specified for the encoder may be used. The data from the encoder is not used for time critical functions, and so it is recommended that the default value of 300K baud is used unless this needs to be reduced because of a limitation imposed by the encoder.

***P1 Device Type* (03.038): EnDat, BiSS, SSI**

Any baud rate that is within the range specified for the encoder may be used. The line delay is measured during initialisation, and used to compensate this delay during communications with the encoder. Therefore there is no timing based restriction on the length of the cable between the position feedback interface and the encoder. However, care should be taken to ensure that the wiring arrangement and the type of cable used are suitable for the selected baud rate and the distance between the position interface and the encoder. See *P1 Low Speed Update Rate Active* (03.063) for more details on timing restrictions related to the drive sample times.

***P1 Device Type* (03.038): Any other device**

P1 Comms Baud Rate (03.037) has no effect.

Parameter	03.038 <i>P1 Device Type</i>		
Short description	Defines the device type connected to the drive P1 position feedback interface		
Mode	Open-Loop		
Minimum	0	Maximum	17
Default	0	Units

12	SC Servo
13	BiSS
14	Resolver
15	SC SC
16	Commutation Only
17	SC BiSS

P1 Device Type (03.038) should be set up to match the device connected to the drive P1 position feedback interface. The table below gives the position feedback types supported by the P1 position feedback interface.

<i>P1 Device Type</i> (03.038)	Signals	Position feedback type	Communications
0: AB	Quadrature	Incremental	None
1: FD	Frequency and direction	Incremental	None
2: FR	Forward and reverse	Incremental	None
3: AB Servo	Quadrature and commutation	Absolute commutation signals with incremental	None
4: FD Servo	Frequency and direction, and commutation	Absolute commutation signals with incremental	None
5: FR Servo	Forward and reverse, and commutation	Absolute commutation signals with incremental	None
6: SC	SINCOS	Incremental SINCOS	None
7: SC Hiperface	SINCOS and Hiperface comms	Absolute comms with incremental SINCOS	Hiperface
8: EnDat	EnDat comms	Absolute comms	EnDat 2.1 EnDat 2.2
9: SC EnDat	SINCOS and EnDat comms	Absolute comms with incremental SINCOS	EnDat 2.1
10: SSI	SSI comms	Absolute comms	SSI
11: SC SSI	SINCOS and SSI comms	Absolute comms with incremental SINCOS	SSI
12: SC Servo	SINCOS and commutation	Absolute commutation signals with incremental	None
13: BiSS	BiSS comms	Absolute comms	BiSS
14: Resolver	Resolver	Resolver	None
15: SC SC	SINCOS and single sine and cosine signals per revolution	SINCOS with absolute position from single sine and cosine signals	None
16: Commutation Only	Commutation only	Absolute commutation signals only	None
17: SC BiSS	BiSS comms	Absolute comms with incremental SINCOS	BiSS
18: Option Slot 1	None	Provided by option module	None
19: Option Slot 2	None	Provided by option module	None
20: Option Slot 3	None	Provided by option module	None
21: Option Slot 4	None	Provided by option module	None

Position feedback type:

Incremental

Position devices that provide incremental feedback do not give absolute position feedback. The position is zero at power-up and accumulates the change of position from that point on. These devices are suitable for motor control in RFC-A mode. They can also be used for RFC-S mode, but some form of phasing auto-tune is required each time the position feedback is initialised.

Absolute commutation signals with incremental

Position devices with commutations signals are intended to provide absolute position feedback for motor control in RFC-S mode. If one of these devices is used for RFC-A mode the commutation signals are ignored. The position information given in *P1 Revolution/Pole Pitch Counter* (03.028), *P1 Position* (03.029) and *P1 Fine Position* (03.030) appears as though the position feedback device is an incremental type in that it is initialised to zero at power-up and then accumulates the change of position from that point on. The commutation signals are used directly by the motor control algorithms in RFC-S mode to determine the motor position after position feedback initialisation. There must be one period of the commutation signals for each pole pair for a rotary motor (i.e. 3 commutation signal periods per revolution for a 6 pole motor), or one period of the commutation signals must be equal to the motor pole pitch for a linear motor. It should be noted that for a movement of up to 1/3 of the commutation signal period after position feedback initialisation the

maximum motor torque is limited to 0.866 of the maximum possible torque.

Absolute commutation signals only

Position devices with commutations signals are intended to provide absolute position feedback for motor control in RFC-S mode but can also be used to provide position feedback for motor control in RFC-A mode. The position is derived from the commutation signals alone. A phase locked loop is used to smooth the feedback, but this introduces a delay and there is significant ripple in the position and speed feedback at low speeds. If this method is used for motor control then low speed loop gains should be used and *P1 Feedback Filter* (03.042) should be used to filter the feedback.

Incremental SINCOS

An incremental SINCOS encoder can be used in the same way as an AB incremental encoder, except that the position resolution is increased with interpolation. These devices are suitable for motor control in RFC-A mode. They can also be used for RFC-S mode, but some form of phasing auto-tune is required each time the position feedback is initialised. The increase in resolution due to interpolation depends on the magnitude and frequency of the sine wave signals at the position feedback interface inputs on the drive. The sine wave inputs take balanced signals each with a nominal 1V peak to peak level. (This means that the difference measured between the two signals for one sine wave input would be 2V peak to peak or 1V peak.) If interpolation is not used the position feedback would have a resolution related to the number of sine waves per revolution (i.e. 512 sine waves per revolution would give position feedback resolution equivalent to a 512 line incremental encoder, which gives 2048 discernible positions per revolution). With the nominal signal level and an input frequency below 5kHz the interpolation using sine waves instead of digital incremental signals increases the resolution by a factor of 900. For a 512 sine wave encoder this would give a resolution of $512 \times 4 \times 900 = 1843200$ discernible positions per revolution. This is equivalent to a digital incremental encoder with 460800 lines per revolution. The increased resolution due to interpolation is directly proportional to the sine wave signal voltage levels, and also reduces with sine wave signal frequency. The resolution is given by

$$\text{Resolution} = P1 \text{ Rotary Lines Per Revolution (03.034)} \times 4 \times 900 \times V_{\text{peak to peak of the sine wave signals}} \times \text{Frequency Factor}$$

where the frequency factor is given below.

1kHz	5kHz	50kHz	100kHz	200kHz	500kHz
1.00	1.00	0.86	0.66	0.39	0.14

Increasing the sine wave signal level above 1V peak to peak will increase the resolution, but the level should not be increased above 1.5V or else the input will saturate and the sine waves will be distorted.

Absolute comms with incremental SINCOS

The absolute position is obtained after position feedback initialisation via the comms interface and then after that point by tracking the incremental change from the sine wave signals. Interpolation is used to increase the position resolution. The comms interface can be used to check the position derived from the sine waves. It can also be used for bi-direction transfer of data between the drive and encoder (except SSI comms). These devices can be used for motor control in RFC-A or RFC-S modes.

Absolute comms

The absolute position is obtained at all times via the encoder comms. The comms interface can also be used for bi-directional transfer of data between the drive and the encoder (except SSI mode). These devices can be used for motor control in RFC-A or RFC-S modes.

Resolver

A resolver can be used to provide absolute position feedback within the range covered by one electrical revolution of the resolver (i.e. 360° mechanical for a 2 pole device, 180° mechanical for a 4 pole device, etc.). An angle of 0 degrees corresponds to the position where the cosine input is at its maximum and in phase with the excitation and the sine input zero. A resolver can be used for motor control in RFC-A mode or RFC-S mode. In RFC-S mode a 2 pole resolver can be used with a motor with any number of motor poles, but with any other number of poles there must be an integer number of motor poles for each resolver pole. In RFC-A mode this restriction does not apply. Standard or high speed sampling can be selected with *P1 Resolver Excitation* (03.066). If standard sampling is selected and the position feedback used for motor control the maximum operating speed is limited before the control performance starts to deteriorate. See *P1 Resolver Excitation* (03.066) for more details.

SINCOS with absolute position from sine and cosine signals

This type of device, which is not recommended for new applications, is intended to provide absolute position feedback for motor control in RFC-S mode. If one of these devices is used for RFC-A mode the additional sine wave signals and the Z1 marker signal do not affect the motor control position feedback. The position information given in *P1 Position* (03.029) and *P1 Fine Position* (03.030) is initialised to the position within one turn and *P1 Revolution/Pole Pitch Counter* (03.028) is set to zero when the device is initialised based on the once per turn sine and cosine signals. This gives a moderately accurate absolute position. When a marker event occurs it is used to give a more accurate absolute position. Care should be taken to ensure that the position feedback device is connected correctly. For example a Heidenhain ERN1387 device should be connected as follows: 1/2=A+/A- (Cosine), 3/4=B+/B- (Sine), 5/6=R+/R- (Marker), 7/8=C+/C- (Single turn cosine), 9/10=D+/D- (Single turn sine). It is assumed that the marker occurs at the positive zero crossing of the single turn cosine signal when operating in the forwards direction (i.e. compatible with the ERN1387). To ensure the drive can correctly detect the reference marker pulse with a Heidenhain ERN1387 encoder it is recommended that bit 3 of *P1 Marker Mode* (03.031) is set to 1.

Provided by Option Module

Position feedback information can be provided via the P1 interface from an option module. This is intended to be used by option modules that are not position feedback category modules. If this type of device is selected, and the module in the selected slot supports this feature, the position provided by the P1 interface will be written by the module and the interface will become initialised. If the option does not support this feature then the position will remain at zero and the interface will not become initialised. It should be noted that the system allows 1.3s after power-up, or feedback interface re-initialisation, for the option module to indicate that it is providing feedback before a *Encoder 4* trip will be initiated. If the option module takes longer than this to indicate that position feedback is available the power up delay should be extended with *P1 Additional Power-up Delay* (03.049).

The option module will provide the position as a 32 bit value separated into turns and position within a turn as shown below.

Turns	Position
-------	----------

The number of turns bits should be set up in *P1 Rotary Turns Bits* (03.033) and the position value should be left justified. For example, if the information being provided contains 8 turns bits and 16 position bits then *P1 Rotary Turns Bits* (03.033) should be set to 8 and the information should be written as shown below.

8 turns bits	16 position bits	8 zeros
--------------	------------------	---------

For a linear device *P1 Rotary Turns Bits* (03.033) should be used in the same way to partition the data from the module where one turn corresponds to one pole of the motor.

To avoid discontinuities when the whole position rolls over the maximum number of turns boundary, the drive calculates the change of position between the values provided by the option module at each sample and then accumulates the result. It is important that the change of position provide by the option module between samples is less than half the range of the position value. For example, if 16 position bits are being used the change must be less than 32767. This only applies when the position feedback interface is in the initialised state. If it is not initialised then larger changes can be applied.

Communications:

Hiperface

Hiperface is an asynchronous bi-direction communications protocol that is only used with incremental sine waves. Therefore it can be used to check the position derived from the sine waves or for bi-direction transfer of data between the drive and encoder. A checksum is provided for error checking.

EnDat 2.1

EnDat 2.1 is a synchronous bi-direction communications protocol that is intended to be used with incremental sine waves. Therefore it can be used to check the position derived from the sine waves or for bi-direction transfer of data between the drive and encoder. It can be used as an absolute comms only type position feedback interface, but the resolution of the position feedback using this method may be limited. If it is used in this way it is not possible to use the position feedback via comms at the same time as communicating with the encoder for data transfer. A CRC is provided for error checking.

EnDat 2.2 and BiSS C Mode

EnDat 2.2 and BiSS are synchronous bi-direction communications protocols that are intended to be used alone. It is possible to obtain position feedback at the same time as communicating with the encoder for data transfer. A CRC is provided for error checking.

SSI

SSI is a uni-directional communications protocol that is intended to be used alone. It is only possible to obtain the position information from the encoder and it is not possible to transfer data between the drive and the encoder. No error checking is provided by the SSI protocol, and so encoders based on this interface are not recommended for new applications.

Parameter	03.039 P1 Termination Select		
Short description	Used to enable or disable the terminations on the position feedback interface inputs		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Termination Select (03.039) is used to enable or disable the terminations on the position feedback interface inputs. The function of *P1 Termination Select* (03.039) depends on the position feedback device type selected in *P1 Device Type* (03.038) as shown below.

Terminals 5/6 have selectable pull-apart resistors which follow the same state as the termination resistors for terminals 5/6, unless described differently below.

P1 Device Type (03.038): AB, FD, FR, AB Servo, FD Servo, FR Servo

Terminal	Input	03.039 = 0	03.039 = 1	03.039 = 2
1/2 & 3/4	A1 & B1	Disabled	Enabled	Enabled
5/6	Z1	Disabled	Disabled	Enabled

U1, V1 & W1 terminations (terminals 7/8, 9/10 & 11/12) are always enabled for AB Servo, FD Servo and FR Servo encoders.

P1 Device Type (03.038): SC, SC Servo, SC SC

Terminal	Input	03.039 = 0	03.039 = 1	03.039 = 2
1/2 & 3/4	Cos1 & Sin1	Disabled	Enabled	Enabled
5/6	Z1	Disabled	Disabled	Enabled

U1, V1 & W1 (terminals 7/8, 9/10 & 11/12) terminations are always enabled for SC Servo encoders. SCs1 and SSn1 (terminals 7/8 & 9/10) terminations are always enabled for SC SC encoders.

P1 Device Type (03.038): SC Hiperface, SC EnDat, SC SSI, SC BiSS

Terminal	Input	03.039 = 0	03.039 = 1	03.039 = 2
1/2 & 3/4	Cos1 & Sin1	Disabled	Enabled	Enabled
5/6	D1	Enabled	Enabled	Enabled

For SC EnDat and SC SSI encoder the pull-apart resistors on the D1 input/output (terminals 5/6) are always disabled, and for SC Hiperface encoders the pull-apart resistors on the D1 input/output (terminals 5/6) are always enabled.

P1 Device Type (03.038): EnDat, BiSS, SSI

Terminal	Input	03.039 = 0	03.039 = 1	03.039 = 2
1/2 & 3/4	D1/CLK1	Enabled	Enabled	Enabled
5/6	Z1	Disabled	Disabled	Enabled

If the *P2 Device type* (03.138) is set to EnDat, BiSS or SSI and the encoder simulation output is enabled, then the Z1 input becomes the data (D2) input for the P2 position interface and termination resistors are always enabled and pull-apart resistors are always disabled.

P1 Device Type (03.038): Resolver

P1 Termination Select (03.039) has no effect as terminations are always disabled.

P1 Device Type (03.038): Commutation Only

P1 Termination Select (03.039) has no effect as terminations are always enabled.

Parameter	03.040 P1 Error Detection Level		
Short description	Used to enable or disable position feedback trip functions		
Mode	Open-Loop		
Minimum	0 (Display: 00000000)	Maximum	255 (Display: 11111111)
Default	0 (Display: 00000000)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW, BU		

This parameter can be used to enable or disable position feedback trip functions as follows:

Bit	Function	Trip(s)	Comments
0	Enable wire break detection.	Encoder 2	Bits 5 and 6 have no effect if this bit is set to zero.
1	Enable phase error detection.	Encoder 3	
2	Enable SSI power supply alarm bit monitor.	Encoder 6	
3	Disable indicated trips.	Encoder 1 to Encoder 6	Trips related to bits 0, 1, 2, 5 and 6 do not occur if this bit is set to one. See note below about the position feedback device becoming uninitialised.
4	Disable indicated trip.	Encoder 7.	
5	Enable wire break detection for sine wave commutation signals for SC SC type encoders.	Encoder 2	
6	Enable wire break detection for the marker with SC SC type encoders with Heidenhain ERN1387 type marker signals.	Encoder 2	
7	Enable more sensitive resolver wire break detection.	Encoder 2	The standard wire break detection is only likely to detect a break in the excitation signal, or both the sine and cosine signals together. The more sensitive system will detect a break in any signal provided the motor is rotating. If the motor is stationary, there are positions where wire break will not be detected. The standard system uses 10% of the expected 1Vrms feedback signals as the detection threshold, but the more sensitive system uses 80%. If the resolver ratio is significantly less than 3:1 with 3V excitation, or 2:1 with 2V excitation, then the more sensitive detection system should not be used.

Bits 3 and 4 do not prevent the device from becoming un-initialised. The trip is suppressed, but the device is still un-initialised and this is indicated by the appropriate bit for the position feedback interface in *Position Feedback Initialized* (03.076).

Encoder trips

The following table shows trips that can be initiated that are related to the position feedback interface P1. The sub-trip number is 1 for the drive P1 position feedback interface.

Drive trip	Encoders	Reason for error
Encoder 1	All	Power supply short circuit
Encoder 2	AB, FD, FR, AB Servo, FD Servo, FR Servo	Hardware wire-break detect on A1, B1 and Z1 inputs ¹ . (Note that there is no wire break detection on the U1, V1 and W1 commutation inputs.)
	SC, SC Servo, SC Hiperface, SC EnDat, SC SSI, Resolver, SC SC, SC BiSS	Software wire break detection on sine wave signals. Marker and single turn sine wave commutation signals for SC SC device ⁵ . (Note that there is no wire break detection on the U1, V1 and W1 commutation inputs.)
Encoder 3	AB Servo, FD Servo, FR Servo, SC Servo	Phase error ²
	SC Hiperface, SC EnDat, SC SSI, SC BiSS	Sine/cosine phase error ³
Encoder 4	SC Hiperface, SC EnDat, EnDat, BiSS, SC BiSS	Comms timeout
	Option Slot 1, Option Slot 2, Option Slot 3, Option Slot 4	The option module in the selected option slot has not indicated that it is providing position feedback.
Encoder 5	SC Hiperface, SC EnDat, EnDat, BiSS, SC BiSS	Checksum/CRC error
	SC SSI, SSI	Not ready at start of position transfer (i.e. data input not one)
Encoder 6	SC Hiperface, SC EnDat, EnDat, BiSS, SC BiSS	The encoder has indicated an error
	SSI, SC SSI	Power supply alarm bit active
Encoder 7	All	A set-up parameter for the device or the number of pole pairs for the currently selected motor have been changed.
Encoder 8	EnDat, SSI, BiSS	<i>P1 Device Type</i> (03.038), <i>P1 Comms Bits</i> (03.035), <i>P1 Comms Baud Rate</i> (03.037), <i>P1 Calculation Time</i> (03.060), <i>P1 Recovery Time</i> (03.061), <i>P1 Line Delay Time</i> (03.062) and <i>P1 User Comms Enable</i> (03.067) are used to determine the time taken for the communications exchange with the encoder. If this time exceeds 250µs an <i>Encoder 8</i> trip is initiated.
Encoder 9	All	Speed feedback selected from an option slot that does not have a position feedback category option module fitted
Phasing Error	All	Incorrect encoder phasing ⁴
Encoder 12	SC Hiperface, BiSS	The encoder could not be identified during auto-configuration
Encoder 13	SC Hiperface, SC EnDat, EnDat, BiSS, SC BiSS	Data read from the position feedback device during auto-configuration is out of range
Encoder 14	BiSS, SC BiSS	The turns or position padding values in parameter <i>P1 Additional Configuration</i> (03.074) are out of range.

1. If the terminations are not enabled on the A1, B1 or Z1 inputs the wire break system will not operate. (Note that as default the Z1 input terminations are disabled to disable wire break detection on this input.)
2. Phase error detection for AB Servo, FD Servo, FR Servo or SC Servo encoders monitors the relationship between the position from the incremental signals and the commutation signals to ensure that the incremental pulses have been counted correctly. The error is detected if the incremental position moves outside the position range defined by the UVW commutation signals by 10°. The trip is initiated if the error is detected for 10 consecutive samples. This system should not be used unless one encoder line (AB Servo), or two lines (FD Servo, FR Servo), are less than 10° electrical or else spurious *Encoder 3* trips will occur.
3. Phase error detection for SINCOS encoders with comms monitors the relationship between the position derived from the sine waves with the position derived via comms. The encoder is interrogated via comms and the comparison is made once per second. If the error is greater than 10° electrical for 10 consecutive samples the trip is initiated. This system should not be used unless one sine wave is less than 10° electrical or else spurious *Encoder 3* trips will occur.
4. Incorrect encoder phasing is detected if the motor reaches half of the speed defined by VM_SPEED_FREQ_REF[MAX] and the phasing error is large enough for the motor to accelerate uncontrollably.
5. Detection of wire break on the sine wave commutation signals or marker of an SC SC device may require the encoder to rotate by several mechanical turns before the fault is detected, i.e. up to 2 turns for the sine wave commutation signals and up to 3 turns for the marker).

Wire-break detection

It may be important to detect a break in the connections between the drive and the position feedback device. This feature is provided for most position feedback devices either directly or indirectly as listed below.

Device	Detection method	Trip produced
AB, FD, FR, AB Servo, FD Servo, FR Servo	Hardware detectors on the A1, B1 and Z1 signal detect a wire break.	Encoder 2
SC, SC Servo, SC Hiperface, SC EnData, SC SSI, SC SC, SC BiSS	The magnitudes of the sine wave signals are monitored as the magnitude of a vector which is calculated as $\sqrt{(\text{Sine}^2 + \text{Cosine}^2)}$. If this is less than the value produced by two valid waveforms with a peak to peak magnitude of 0.25V (i.e. 0.25 of the nominal level of 1V peak to peak) then a trip is initiated. This always detects wire break in the sine and cosine connections if the position feedback is changing. If the position feedback is stationary this may not detect wire break until the position feedback moves, e.g. if the sine connection is broken, but the cosine is at it's maximum then wirebreak will not be detected. Additional monitoring is provided for SC SC encoders to give software wire break detection for the single turn sine wave commutation signals and the marker. If the device is a Heidenhain ERN1387 the marker is too small for hardware wire break detection, and so the additional software detection is required to detect wire break on the marker.	Encoder 2
Resolver	The magnitudes of the sine and cosine input signals are monitored in a similar way to SINCOS signals where the peak of the sine and cosine waveforms are used to calculate the vector magnitude. If the calculated value is less than the value produced by two valid waveforms with a differential peak to peak magnitude of 0.4V then a trip is initiated. This detects wire break in the sine and cosine connections. If the position feedback is stationary this may not detect wire break until the position feedback moves, e.g. if the sine connection is broken, but the cosine is at it's maximum then wirebreak will not be detected.	Encoder 2
SC Hiperface, SC EnDat, EnDat, BiSS, SC BiSS	Wire break in the comms link is detected by a CRC or timeout error.	Encoder 4, Encoder 5
SSI, SC SSI	Wire break detection in the comms is difficult with these devices. However, if power supply alarm bit monitoring is enabled the drive will be looking for a one at the start of the message and a zero to indicate that the power supply is okay. If the clock stops or the data line is disconnected the data input to the drive may stay in one state or the other and cause a trip.	Encoder 5, Encoder 6

Position feedback power supply trips

The position feedback power supply from the drive can be switched off by the drive either because the power supply is overloaded (*Encoder 1* trip) or because the internal 24V supply within the drive is overloaded (*PSU 24V* trip). The internal 24V supply provides power for the position feedback power supply, user 24V output, digital I/O, option modules etc. To ensure that an *Encoder 1* trip is not initiated when the internal 24V is overloaded, and subsequently switched off by the drive, there is a delay of 40ms in the detection of *Encoder 1* trip. It is possible for other position feedback trips, such as wire break detection (i.e. *Encoder 2*), to occur when the power supply is removed from the position feedback device. Therefore overloading the internal 24V supply or the position feedback supply could result in an immediate *Encoder 2* trip. To ensure that the correct reason for the trip is given *PSU 24V* and *Encoder 1* trips override an existing *Encoder 2* to *Encoder 6* trip. This means that both the original trip (*Encoder 2* to *Encoder 6*) and then the new trip (*PSU 24V* or *Encoder 1*) are stored in the trip log.

Parameter	03.041 P1 Auto-configuration Select		
Short description	Set to 1 to enable interrogation of the encoder to determine the set up required		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Enabled

P1 Device Type (03.038): SC Hiperface, SC EnDat, EnDat

If auto-configuration has not been disabled (i.e. *P1 Auto-configuration Select* (03.041) is not 0) then during position feedback initialisation the encoder is interrogated to determine whether the encoder is a rotary or linear encoder and *P1 Linear Feedback Select* (03.051) is set up appropriately. Then the following parameters are set up based on information from the encoder:

Rotary	Linear
<i>P1 Rotary Turns Bits</i> (03.033)	<i>P1 Linear Comms Pitch</i> (03.052)
<i>P1 Rotary Lines Per Revolution</i> (03.034)	<i>P1 Linear Line Pitch</i> (03.053)
<i>P1 Comms Bits</i> (03.035)	<i>P1 Comms Bits</i> (03.035)
<i>P1 Additional Configuration</i> (03.074)	<i>P1 Linear Comms And Line Pitch Units</i> (03.054)

The following actions are also taken to set up the timing for the encoder.

Comms Protocol	Actions taken
EnDat 2.1	<i>P1 Calculation Time</i> (03.060) = From the encoder <i>P1 Recovery Time</i> (03.061) = 30µs Line delay measured and result written to <i>P1 Line Delay Time</i> (03.062)
EnDat 2.2	<i>P1 Calculation Time</i> (03.060) = From the encoder <i>P1 Recovery Time</i> (03.061) is set to 4µs (and the encoder itself is set up to use its short recovery time of 3.75µs) if the <i>P1 Comms Baud Rate</i> (03.037) is 1M or more. Line delay measured and result written to <i>P1 Line Delay Time</i> (03.062)

Once these parameters have been set up it should be possible for the drive to operate correctly with the encoder. Auto-configuration occurs as part of the position interface initialisation if selected, and so if the auto-configuration fails (i.e. communications cannot be established) then initialisation will not be completed. If initialisation has not been completed successfully the drive cannot be enabled (see *Enable Conditions* (06.010)). For SC Hiperface encoders the drive must identify the encoder model number to perform auto-configuration. If communications is established, but the drive cannot recognise the encoder model, an *Encoder 12* trip is produced immediately.

If auto-configuration is disabled ((i.e. *P1 Auto-configuration Select* (03.041) = 0) then none of the above actions are carried out except for the line delay measurement.

P1 Device Type (03.038): BiSS, SC BiSS

With *P1 Auto-configuration Select* (03.041) set to either 0 or 1 the only action taken during initialisation is to measure the line delay and write the result to *P1 Line Delay Time* (03.062).

P1 Device Type (03.038): All other device types

P1 Auto-configuration Select (03.041) has no effect.

Parameter	03.042 P1 Feedback Filter		
Short description	Defines the time period for a sliding window filter that may be applied to the feedback taken from the drive P1 position feedback interface		
Mode	Open-Loop		
Minimum	0	Maximum	5
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	1ms
2	2ms
3	4ms
4	8ms
5	16ms

P1 Feedback Filter (03.042) defines the time period for a sliding window filter that may be applied to the feedback taken from the drive P1 position feedback interface. This is particularly useful in applications where the drive encoder is used to give speed feedback for the speed controller and where the load includes a high inertia, and so the speed controller gains are very high. Under these conditions, without a filter on the feedback, it is possible for the speed loop output to change constantly from one current limit to the other and lock the integral term of the speed controller. In Unidrive SP this filter was applied to the output of the sensorless speed feedback, however, a separate filter is now provided (see *Sensorless Mode Filter* (03.079)).

Parameter	03.043 P1 Maximum Reference		
Short description	Defines the maximum speed reference from device P1		
Mode	Open-Loop		
Minimum	0	Maximum	35940
Default	1500	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

The speed feedback from the drive P1 position feedback interface can be used as a source to control a parameter. The speed feedback is scaled to give a value as a percentage of *P1 Maximum Reference* (03.043) in 0.1% units which is displayed in *P1 Reference* (03.045). The value is then scaled by the *P1 Reference Scaling* (03.044) and then routed to the destination defined by *P1 Reference destination* (03.046).

Normally the destination is updated every 4ms, but if the destination is the *Hard Speed Reference* (03.022), *P1 Maximum Reference* (03.043) = VM_SPEED_FREQ_REF[MAX] and *P1 Reference Scaling* (03.044) = 1.000 it is updated every 250µs. Although the hard speed reference is updated every 250µs internally a value in rpm or mm/s is written to *Hard Speed Reference* (03.022) every 4ms for indication only. It should be noted that if the fast update method is used the resolution of the speed feedback derived from the position feedback device defines the resolution of the hard speed reference and that any ripple on the feedback will be present on the hard speed reference (see *Speed Feedback* (03.002)).

Parameter	03.044 P1 Reference Scaling		
Short description	Defines the scaling applied to P1 reference		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *P1 Maximum Reference* (03.043).

Parameter	03.045 P1 Reference		
Short description	Displays the value in P1 reference		
Mode	Open-Loop		
Minimum	-100.0	Maximum	100.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, ND, NC, PT		

See *P1 Maximum Reference* (03.043).

Parameter	03.046 P1 Reference destination		
Short description	Defines the destination parameter for P1 reference		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *P1 Maximum Reference* (03.043).

Parameter	03.047 P1 SSI Incremental Mode		
Short description	Set to 1 to enable SSI incremental mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Device Type (03.038): EnDat, BISS

P1 SSI Incremental Mode (03.047) has no effect and these comms modes can only operate in incremental mode, i.e. the absolute position is taken during encoder initialisation and then incremental positions are accumulated from that point on, to determine the position. If there is an error in the position read from the encoder this will be detected from the CRC check, and the position data will be ignored until correct data is available or the drive trips after a number of consecutive errors. This prevents large spurious changes in position due to data errors, and so absolute mode is not required.

P1 Device Type (03.038): SSI

If *P1 SSI Incremental Mode* (03.047) = 0 the complete absolute position is read at each sample. Care should be taken when using this mode as some unwanted effects can occur when the encoder passes through the boundary between its maximum position and zero. In this mode the encoder can be used for motor control provided at least 6 bits of turns information are provided by the encoder otherwise an over speed trip will be produced as the position passes over the maximum position to zero boundary. *P1 Normalised Position* (03.058) can be used for position control over this boundary provided the normalised turns bits are set up so that the normalised positions do not contain turns information that is not available from the encoder. As the SSI format does not include any error checking it is not possible to detect if the position data has been corrupted by noise. The benefit of using the absolute position directly from an SSI encoder is that even if the encoder communications are disturbed by noise and position errors occur, the position will always recover the correct position after the disturbance has ended.

If *P1 SSI Incremental Mode* (03.047) = 1 the absolute position is only taken from the encoder during initialisation. The change of position over each sample is then accumulated to determine the position. This method always gives 16 bits of turns information that can always be used without jumps in position whatever value is used as the turns bits for normalisation. If noise corrupts the data from an SSI encoder it is possible to have apparent large change of position, and this can result in the turns information becoming and remaining corrupted until the encoder is re-initialised.

If an SSI encoder is used, but is not powered from the drive, and the encoder is powered up after the drive, it is possible that the first change of position detected could be large enough to cause the problems described above. This can be avoided if the encoder interface is initialised with *Initialise Position Feedback* (03.075) after the encoder has powered up. If the encoder includes a power supply alarm bit, the power supply monitor should be enabled. This will ensure that the drive remains tripped until the encoder is powered up and the action of resetting the trip will reinitialise the encoder interface.

P1 Device Type (03.038): All other device types

P1 SSI Incremental Mode (03.047) has no effect.

Parameter	03.048 P1 SSI Binary Mode		
Short description	Set to 1 to enable SSI binary mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Device Type (03.038): SC SSI, SSI

SSI encoders normally use Gray code data format. However, some encoders use binary format which may be selected by setting *P1 SSI Binary Mode* (03.048) to one.

P1 Device Type (03.038): All other device types

P1 SSI Binary Mode (03.048) has no effect.

Parameter	03.049 P1 Additional Power-up Delay		
Short description	Defines an additional delay for when any attempt is made to communicate to the device P1		
Mode	Open-Loop		
Minimum	0.0	Maximum	25.0
Default	0.0	Units	s
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

When the position feedback is initialised, at power-up or at any other time, a delay is included before the information from the feedback device is used or any attempt is made to communicate with the device. The minimum delays are shown in the table below. *P1 Additional Power-up Delay* (03.049) defines an additional delay that is added to the minimum delay.

P1 Device Type (03.038)	Minimum delay
AB, FD, FR AB Servo, FD Servo, FR Servo SC, SC Servo Resolver, SC SC	100ms
SC Hiperface	150ms
EnDat, SC EnDat SSI, SC SSI BISS, SC BiSS Option Slot 1, Option Slot 2, Option Slot 3, Option Slot 4	1.3s

Parameter	03.050 P1 Feedback Lock		
Short description	Set to 1 to prevent the position feedback parameters for P1 being updated		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *P1 Feedback Lock* (03.050) = 1 then *P1 Revolution/Pole Pitch Counter* (03.028), *P1 Position* (03.029) and *P1 Fine Position* (03.030) are not updated. If *P1 Feedback Lock* (03.050) = 0 then these parameters are updated normally.

Parameter	03.051 P1 Linear Feedback Select		
Short description	Set to 1 to configure the P1 interface to operate with a linear position feedback device		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read, Auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

If *P1 Linear Feedback Select* (03.051) = 0 then the drive P1 position feedback interface is configured to operate with a rotary position feedback device. *P1 Rotary Turns Bits* (03.033) and *P1 Rotary Lines Per Revolution* (03.034) should be used to set up the position feedback interface.

If *P1 Linear Feedback Select* (03.051) = 1 then the position feedback interface is configured to operate with a linear position feedback device. *P1 Linear Comms Pitch* (03.052) and *P1 Linear Line Pitch* (03.053) should be used to set up the position feedback interface.

Parameter	03.052 P1 Linear Comms Pitch		
Short description	Defines the distance covered by the least significant bit of the position information in a comms message from a linear encoder		
Mode	Open-Loop		
Minimum	0.001	Maximum	100.000
Default	0.001	Units	
Type	32 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	3
Coding	RW		

P1 Device Type (03.038): SC Hiperface, EnDat, SC EnDat, SSI, SC SSI, BiSS, SC BiSS

P1 Linear Comms Pitch (03.052) is used to define the distance covered by the least significant bit of the position information in a comms message from a linear encoder. The units used by this parameter are defined by *P1 Linear Comms And Line Pitch Units* (03.054).

P1 Device Type (03.038): Any other device

P1 Linear Comms Pitch (03.052) has no effect.

Parameter	03.053 P1 Linear Line Pitch		
Short description	Defines the linear line pitch for device P1		
Mode	Open-Loop		
Minimum	0.001	Maximum	100.000
Default	0.001	Units	
Type	32 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	3
Coding	RW		

P1 Linear Line Pitch (03.053) only has any effect if the position feedback interface is being used with a linear device (i.e. *P1 Linear Feedback Select* (03.051) = 1) and should be used to define the distances listed below for each type of device. The units used by this parameter are defined by *P1 Linear Comms And Line Pitch Units* (03.054).

P1 Device Type (03.038): AB, AB Servo

P1 Linear Line Pitch (03.053) should be set to the distance covered by one line period on the encoder.

P1 Device Type (03.038): FD, FR, FD Servo, FR Servo

P1 Linear Line Pitch (03.053) should be set to the distance covered by two line periods on the encoder.

P1 Device Type (03.038): SC, SC Hiperface, SC EnDat, SC SSI, SC Servo, SC SC, SC BiSS

P1 Linear Line Pitch (03.053) should be set to the distance covered by one sine wave period on the encoder.

P1 Device Type (03.038): Resolver

P1 Linear Line Pitch (03.053) should be set to the distance covered by one pole of the resolver divided by 2¹⁴.

P1 Device Type (03.038): Any other device

P1 Linear Line Pitch (03.053) has no effect.

Parameter	03.054 P1 Linear Comms And Line Pitch Units		
Short description	Defines the linear units in either millimetres or micrometres		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	millimetres
1	micrometres

P1 Linear Comms And Line Pitch Units (03.054) defines the units used by *P1 Linear Comms Pitch* (03.052) and *P1 Linear Line Pitch* (03.053) in either millimetres or micrometres.

Parameter	03.055 P1 Pole Pair Pitch		
Short description	Defines the change of position for one electrical revolution of the drive output with a linear position device.		
Mode	Open-Loop		
Minimum	0.01	Maximum	1000.00
Default	10.00	Units	mm
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

P1 Pole Pair Pitch (03.055) gives the distance equivalent to one electrical revolution when linear position feedback is used with a motor. One electrical

revolution is one cycle of the a.c. output current from the drive. If the linear position feedback device is being used with a linear motor, then *P1 Pole Pair Pitch* (03.055) should be set to the pole pair pitch of the motor. The pole pitch for linear motors can be the distance between the pole pieces on the stator as shown below. If this is the case the pole pair pitch is twice the length of the motor pole pitch. If *Number Of Motor Poles* (05.011) is set up correctly for a linear motor as 2, then the position feedback as shown in *P1 Position* (03.029) should change by one revolution (65536) over the distance defined by *P1 Pole Pair Pitch* (03.055).

If the linear position feedback is not being used with a motor then the pole pair pitch is the distance over which the position feedback as shown in *P1 Position* (03.029) should change by one revolution, i.e. 65536.

Parameter	03.056 <i>P1 Feedback Reverse</i>		
Short description	Set to 1 to reverse the direction of the position feedback		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *P1 Feedback Reverse* (03.056) = 1 the position feedback is negated. This can be used to reverse the direction of the position feedback. It should be noted that the position and the turns are negated, so for example if *P1 Revolution/Pole Pitch Counter* (03.028) = 0 and *P1 Position* (03.029) = 1000 with *P1 Feedback Reverse* (03.056) = 0, then if *P1 Feedback Reverse* (03.056) is set to one then *P1 Revolution/Pole Pitch Counter* (03.028) = 65535 (-1) and *P1 Position* (03.029) = 64536 (65536 - 1000). This will have an effect on the initial position for example, for a resolver which is a single turn absolute device, where the initial *P1 Revolution/Pole Pitch Counter* (03.028) = 0 with *P1 Feedback Reverse* (03.056) = 0 or 65535 (-1) with *P1 Feedback Reverse* (03.056) = 1.

Reversing the position feedback will not compensate for the following situations:

1. The direction of the incremental signals and the direction of the digital commutation signals are different for encoders which have digital commutation signals (i.e. AB Servo)
2. The direction of the SINCOS signals are incorrect for a SINCOS encoder with comms.

Parameter	03.057 <i>P1 Normalisation Turns</i>		
Short description	Defines the number of turns bits included in the normalisation parameters		
Mode	Open-Loop		
Minimum	0	Maximum	16
Default	16	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

The combination of *P1 Revolution/Pole Pitch Counter* (03.028), *P1 Position* (03.029) and *P1 Fine Position* (03.030) give the position feedback as a 48 bit value. This position cannot be read atomically without locking the position feedback (*P1 Feedback Lock* (03.050) = 1) and it cannot be used directly by the Advanced Motion Controller (see Menu 31). It is useful to be able to create 32 bit position values that can be held by a single parameter as this value can be accessed atomically and can be used directly by the Advanced Motion Controller. *P1 Normalisation Turns* (03.057) defines the number of turns bits included in the following parameters.

P1 Normalised Position (03.058)

P1 Normalised Marker Position (03.059)

F1 Normalised Freeze Position (03.103) if P1 is the source position for freeze function F1

F2 Normalised Freeze Position (03.108) if P1 is the source position for freeze function F2

Parameter	03.058 <i>P1 Normalised Position</i>		
Short description	Displays the position taken from the position feedback device including the effect of the marker function		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P1 Normalised Position (03.058) is the position taken from the position feedback device including the effect of the marker function.

See *P1 Normalisation Turns* (03.057) for details of the format.

Parameter	03.059 <i>P1 Normalised Marker Position</i>		
Short description	Displays the normalised position at the last marker event		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P1 Normalised Marker Position (03.059) is the value *P1 Normalised Position* (03.058) at the last marker event provided bit 2 of *P1 Marker Mode* (03.031) is set to 1. See *P1 Marker Mode* (03.031) for more details.

Parameter	03.060 <i>P1 Calculation Time</i>		
Short description	Defines the time from the first edge of the clock signal from the position feedback interface until the encoder has calculated the position and is ready to return this information		
Mode	Open-Loop		
Minimum	0	Maximum	20
Default	5	Units	µs
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

***P1 Device Type* (03.038): EnDat, BiSS**

P1 Calculation Time (03.060) is the time from the first edge of the clock signal from the position feedback interface until the encoder has calculated the position and is ready to return this information. This is used to calculate the overall time for a message interchange with the encoder. See *P1 Low Speed Update Rate Active* (03.063) for more details.

***P1 Device Type* (03.038): Any other type of device**

P1 Calculation Time (03.060) has no effect.

Parameter	03.061 <i>P1 Recovery Time</i>		
Short description	Defines the time that must be allowed after each message interchange before a new message begins		
Mode	Open-Loop		
Minimum	4	Maximum	100
Default	30	Units	µs
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

***P1 Device Type* (03.038): EnDat, SSI, BiSS**

P1 Recovery Time (03.061) is the time that must be allowed after each message interchange before a new message begins.

***P1 Device Type* (03.038): Any other type of device**

P1 Recovery Time (03.061) has no effect.

Parameter	03.062 <i>P1 Line Delay Time</i>		
Short description	Displays the transmission delay between the position feedback interface and the encoder and back again		
Mode	Open-Loop		
Minimum	0	Maximum	5000
Default		Units	ns
Type	16 Bit User Save	Update Rate	Background read, position feedback initialisation write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

***P1 Device Type* (03.038): EnDat, SC EnDat, BiSS, SC BiSS**

During position feedback initialisation the transmission delay between the position feedback interface and the encoder and back again is measured and stored in *P1 Line Delay Time* (03.062). This value is then used to compensate for this delay so that the clock/data skew does not prevent the data from the encoder from being read. This means that longer line lengths can be used with these feedback devices provided the correct cable and connection arrangements are used.

***P1 Device Type* (03.038): Any other type of device**

P1 Line Delay Time (03.062) is always zero.

Parameter	03.063 P1 Low Speed Update Rate Active		
Short description	Indicates when the low speed update rate is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P1 Device Type (03.038): EnDat, SSI, BiSS

There is a delay when the position information is obtained via a communications interface from an encoder. It is assumed that the position information is taken from all types of encoder at a fixed datum point during each sample period. The drive initiates the comms transfer at a suitable point in advance of the datum to ensure that the position information is available when required. A correction is then applied to the position information based on the change of position over the previous sample and the advance time so that the position appears to have been sampled at the datum. If the communications exchange, including allowing the encoder a recovery time (*P1 Recovery Time* (03.061)), is completed in 60µs and the time required to obtain the full position is completed in 40µs then the position is sampled at each current controller task and *P1 Low Speed Update Rate Active* (03.063) = 0. Otherwise if the communication exchange is completed in 230µs the position is sampled every 250µs and *P1 Low Speed Update Rate Active* (03.063) = 1. If the complete exchange takes any longer an *Encoder 8* trip is initiated. The following table shows the calculations used by the drive to determine the necessary time to obtain the required data.

Protocol	Time for full position	Time for complete data exchange
EnDat 2.1 encoder	$t_{ST} + t_D + 10T + 2T + NtT + 5T$ where $t_{cal} \leq t_{ST} + t_D/2 + 10T$ $t_{ST} + t_D + t_{cal} + 2T + NtT + 5T$ where $t_{cal} > t_{ST} + t_D/2 + 10T$	Time for full position + t_m
EnDat 2.2 encoder	$t_{ST} + t_D + 10T + 3T + NtT + 5T + t_{Add}$ where $t_{cal} \leq t_{ST} + t_D/2 + 10T$ $t_{ST} + t_D + t_{cal} + 3T + NtT + 5T + t_{Add}$ where $t_{cal} > t_{ST} + t_D/2 + 10T$	Time for full position + t_m
BiSS	$t_D + t_{cal} + 2T + NtT + 2T + (CRCBits \times T)$	Time for full position + t_m
SSI	$t_D + T + NtT$ (t_D cannot be measured, and so a value of 1.25µs is used)	Time for full position + t_m

where

Value	Description	Source
t_{ST}	EnDat start time	For 100K baud = 5µs, 200K baud = 2.5µs, for all other baud rates = 2µs
t_D	Transmission delay from the drive to the encoder and back	<i>P1 Line Delay Time</i> (03.062)
T	1 / baud rate	<i>P1 Comms Baud Rate</i> (03.037)
t_{cal}	Position calculation time	<i>P1 Calculation Time</i> (03.060)
Nt	Total number of position information bits	<i>P1 Comms Bits</i> (03.035)
t_m	Encoder recovery time	<i>P1 Recovery Time</i> (03.061)
t_{Add}	Time for additional information	$t_{Add1} = 31T + t_{ST} + 30T$
CRCBits	The number of bits in the CRC applied to the position	<i>P1 Additional Configuration</i> (03.074)

P1 Device Type (03.038): Option Slot 1, Option Slot 2, Option Slot 3, Option Slot 4

It is intended that position information is provided by an option module with an update rate of 250µs. It is assumed that the position that is provided is sampled 230µs before the position datum point. *P1 Low Speed Update Rate Active* (03.063) is always one to indicate that a sample rate of 250µs is being used.

P1 Device Type (03.038): Any other type of device

P1 Low Speed Update Rate Active (03.063) is always zero.

Parameter	03.064 P1 Encoder Protocol Detected		
Short description	Defines which protocol is used with the device P1		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Hiperface
2	EnDat2.1
3	EnDat2.2
4	BiSS

P1 Encoder Protocol Detected (03.064) shows the encoder comms protocol detected during position feedback initialisation. If *P1 Device Type* (03.038) is set to SC Hiperface or BiSS then *P1 Encoder Protocol Detected* (03.064) is set to the appropriate value after successful communication with the encoder during initialisation. If *P1 Device Type* (03.038) is set to EnDat or SC EnDat then *P1 Encoder Protocol Detected* (03.064) is set to the appropriate EnDat protocol after successful communication with the encoder during initialisation. If communications is not successful during initialisation then *P1 Encoder Protocol Detected* (03.064) is set to 0.

Parameter	03.065 P1 Resolver Poles		
Short description	Defines the number of poles for the resolver connected to P1		
Mode	Open-Loop		
Minimum	1	Maximum	10
Default	1	Units	PolePairs
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Device Type (03.038): Resolver

P1 Resolver Poles (03.065) should be set to the number pole pairs for the resolver connected to the P1 position feedback interface. If the resolver is being used for motor control then a 2 pole resolver can be used with any motor, but if the number of resolver poles is greater than 2, it can only be used when motor poles / resolver poles is an integer (i.e. a 4 pole resolver can be used with an 8 pole motor). Note that this value is only used if *P1 Linear Feedback Select* (03.051) = 0. If not then the position feedback must be set up using *P1 Linear Line Pitch* (03.053) and *P1 Pole Pair Pitch* (03.055).

P1 Device Type (03.038): Any other type of device

P1 Resolver Poles (03.065) has no effect.

Parameter	03.066 P1 Resolver Excitation		
Short description	Defines the excitation of the resolver when connected to P1		
Mode	Open-Loop		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	6kHz 3V
1	8kHz 3V
2	6kHz 2V
3	8kHz 2V
4	6kHz 3V Fast
5	8kHz 3V Fast
6	6kHz 2V Fast
7	8kHz 2V Fast

P1 Device Type (03.038): Resolver

P1 Resolver Excitation (03.066) defines the excitation voltage and frequency. A level of 3V r.m.s. should be used with 3:1 resolvers and 2V r.m.s. with 2:1 resolvers. These give a nominal level of 1V r.m.s. feedback into the position feedback interface. Other ratios can be used, but if the feedback is increased above the expected levels the feedback seen by the drive will be distorted. The resolution of the position feedback will be reduced proportionally if the feedback is less than 1V r.m.s. With a 2 pole resolver the nominal resolution is equivalent to 1600 line encoder. If the number of resolver poles are increased then the resolution increases, for example a 4 pole resolver gives a resolution equivalent to a 3200 line encoder, etc. The position feedback system allows for a delay from the excitation to the feedback from the resolver of up to 45° and will compensate for this lag during the position feedback initialisation process. (It should be noted that the excitation voltage given is the nominal level, but this can be slightly higher than the nominal level.)

The resolver interface offers two sampling rates: standard and fast. With standard sampling (*P1 Resolver Excitation* (03.066) < 4) any switching frequency can be used with any resolver excitation frequency and the switching frequency can be changed when the position feedback is being used without any transient effects. There is a 250us sampling delay with this system and if the resolver feedback is used for motor control the system can become unstable at high speeds. It is recommended that the motor speed is limited to 9000rpm / Motor Pole Pairs. With fast sampling (*P1 Resolver Excitation* (03.066) ≥ 4)

the sample delay is significantly reduced and resolver feedback can be used up to the maximum limit of 30000rpm, but the feedback is much noisier and the acoustic noise produced by the motor is increased. It is possible to switch between standard and fast sampling while the drive is enabled and controlling a motor, so for example standard sampling can be used at low speeds, and then fast sampling can be used at higher speeds. Normally when *P1 Resolver Excitation* (03.066) is changed an *Encoder 7* is initiated because the position feedback set-up has been changed and the position feedback interface needs to be re-initialised. However, if the new value of *P1 Resolver Excitation* (03.066) is the old value plus or minus 4 (i.e. 0 to 4, or 5 to 1, etc.) then a trip is not initiated and the interface does not need to be initialised.

The following restrictions apply if fast sampling is selected:

1. 2, 4, 8 or 16kHz switching frequencies should be used with 8kHz excitation. 3, 6 or 12kHz switching frequencies should be used with 6kHz excitation. If these conditions are not met the system will automatically operate with standard sampling.
2. If the switching frequency is changed by one step, i.e. from 2 to 3kHz, there will be a transient in the position feedback. To ensure that this does not happen as the drive alters the switching frequency because it has become too hot *Auto-switching Frequency Step Size* (05.036) should be left at its default value, so that all changes are made in steps of 2.
3. If the resolver feedback is not being used as the feedback for motor control then its sample rate is automatically reduced and the position feedback will automatically operate with standard sampling.
4. If a linear mode is selected (i.e. *P1 Linear Feedback Select* (03.051) = 1) then the system will operate with standard sampling.

P1 Device Type (03.038): Any other type of device

P1 Resolver Excitation (03.066) has no effect

Parameter	03.067 P1 User Comms Enable		
Short description	Enables the use of the user comms parameters to communicate to the encoder connected to P1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC, PT		

If *P1 User Comms Enable* (03.067) set to one it is possible to use *P1 User Comms Transmit Register* (03.068) and *P1 User Comms Receive Register* (03.069) to communicate with an encoder that has a Hiperface, EnDat 2.1, EnDat2.2 or BiSS interface. A description of how to use these registers is given below.

P1 Device Type (03.038): SC Hiperface, SC EnDat

Hiperface or EnDat 2.1 communications are used as appropriate if *P1 User Comms Enable* (03.067) is set to one.

P1 Device Type (03.038): EnDat

Communication is enabled when *P1 User Comms Enable* (03.067) is set to one. If the encoder supports EnDat 2.2 it is possible to enable user communications at any time even if the drive is enabled. Otherwise if the encoder only supports EnDat 2.1 communication with the encoder is not possible.

P1 Device Type (03.038): BISS, SC BiSS

If *P1 User Comms Enable* (03.067) is set to one it is possible to enable user communications at any time even if the drive is enabled.

Encoder communications

A communication channel is provided to allow the user to communicate with an encoder connected to one of the communications interfaces. It should be noted that the communications channel is disabled under the following conditions:

1. If auto-configuration is active.
2. During the transfer of electronic nameplate data.
3. If the position feedback device is not initialised.
4. The channel is being used by an option module with safety functions.

To send a message to the encoder the required message must be written to the transmit register. To read the response from the encoder the data is read from the receive register. The data is written one byte at a time and is stored in a 16 byte buffer before being sent to the encoder. The data should only be written to the transmit register when it has been cleared to zero by the drive. Bits 13 to 15 are used to control the interface.

Bit	Function
15	This bit should be set to one each time data is written to the transmit register. This indicates that data has been written. This bit will be cleared when the LS byte of the data has been transferred into the comms buffer.
14	This bit should be set when the last byte of the message is written to the transmit register. The data will be read and transferred to the comms buffer and then the message will be sent to the encoder.
13	This bit should be set when the first byte of the message is written to the transmit register. Setting this bit will reset the pointer to the start of the comms buffer.

Data can be read from the receive register at any time. If there is data in the buffer bit 15 will be set. Once the data has been read the register should be cleared and the drive will transfer the next byte of data to the register.

Bit	Function
15	Indicates that data from the last transfer can be read from the receive register.
14	Indicates that the last byte from the receive message is in the register.
13	There is no data in the receive buffer and the LS byte of the receive register is the comms system status. If there was an error in the received message one of the status error bits will also be set until the comms is used again by this system or by the drive.

The status flags are defined as follows:

Bit	Meaning
0	The number of bytes put into the transmit buffer is not consistent with the expected message length. (Hiperface only)
1	The number of bytes written to the transmit buffer, or the expected length of the store data transmit message, or the expected length of a read data message have exceed the length of the buffer. (Hiperface only)
2	The command code is not supported.
3	A valid response was not received from the encoder.

The following sequence should be followed when transmitting and receiving data to ensure that the received data is always read correctly.

1. Check that *P1 User Comms Receive Register* (03.069) is not zero.
2. Check that *P1 User Comms Transmit Register* (03.068) is zero.
3. Write each word of the transmit message to *P1 User Comms Transmit Register* (03.068) in turn, waiting each time for the drive to return *P1 User Comms Transmit Register* (03.068) back to zero before writing the next word.
4. Write zero to *P1 User Comms Receive Register* (03.069).
5. Read *P1 User Comms Receive Register* (03.069) and when it is not zero the drive has updated it with a receive word.
6. Read each receive word in turn writing zero to *P1 User Comms Receive Register* (03.069) after reading the word.

If the above sequence is not followed correctly, it is possible that data from the transmit message will be seen in the first read of the receive message. It is not essential that any or all of the receive message is read before sending a new transmit message, and so steps 4 to 6 can be omitted if required provided step 1 is not ignored.

Hiperface

Up to 15 bytes of data can be written to the buffer. The first byte should be the encoder address. The checksum will be calculated by the drive and added to the end of the message before the message is transmitted to the encoder. The drive checks the checksum of the received message. If successfully received, the receive message can be read via the receive register including the address and the checksum received from the encoder. It should be noted that the encoder must be set up for 9600 baud, 1 start bit, 1 stop bit and even parity (default set-up) for the encoder comms to operate with the drive. Also the data block security should not be enabled in the encoder if the drive encoder nameplate system is to operate correctly. See Hiperface specification for more details of the comms message format.

The following commands are supported:

Code	Command
0x42	Read position
0x43	Set position
0x44	Read analog value
0x46	Read counter
0x47	Increment counter
0x49	Clear counter
0x4a	Read data (maximum of 10 bytes)
0x4b	Store data (maximum of 9 bytes)
0x4c	Data field status
0x4d	Create a data field
0x4e	Available memory
0x50	Read encoder status
0x52	Read type
0x53	Reset encoder

SC EnDat

Up to 4 bytes can be written to the buffer in the following format.

Byte 0			
Command	Address	Data (MSB)	Data (LSB)

The following commands are supported.

Code	Command	Address	Data (MSB)	Data (LSB)
0x07	Encoder to send position value	Any	Any	Any
0x0E	Selection of memory area	MRS code	Any	Any
0x1C	Encoder to receive parameter	Address	Data (MSB)	Data (LSB)
0x23	Encoder to send parameter	Address	Any	Any
0x2A	Encoder to receive reset	Any	Any	Any

The message from the encoder contains a CRC which is checked. If there are no errors in the message, then the message is put into the comms buffer. The position is retrieved from the drive buffer most significant byte first (Byte 0) and least significant byte last (Byte 7). An example is shown below where a 48 bit value has been read from the encoder which contains an error bit (Bit 0) and 47 bits of position data (Bits 1 to 47) where Bit 1 is the least significant bit of the position. If there are less position bits the position is right justified with leading zeros.

Byte 0							Byte 7
0	0	Bits47-40	Bits 39-32	Bits 31-24	Bits 23-16	Bits 15-8	Bits 7-0

If any other command is sent the response is shown below. The response is available when the encoder has responded, but for "Encoder to receive parameter" and "Encoder to receive reset" commands there is an additional delay of 12ms and 20ms respectively to allow the encoder to be ready again.

Byte 0		Byte 2
Address	Data (MSB)	Data (LSB)

EnDat

Up to 4 bytes can be written to the buffer in the same format as for EnDat 2.1. The following commands are supported.

Code	Command	Address	Data (MSB)	Data (LSB)
0x09	Encoder to send position value with additional information and select memory area	MRS code	0x00	Block address
0x1B	Encoder to send position value with additional information and receive parameters	Address	Data (MSB)	Data (LSB)
0x24	Encoder to send position value with additional information and send parameters	Address	Any	Any
0x2D	Encoder to send position value with additional information and receive error reset	Any	Any	Any
0x36	Encoder to send position values and receive test command	Any	Any	Any

The message from the encoder contains a CRC which is checked. If there are no errors in the message the message is put into the comms buffer.

Byte 0		Byte 2
Additional information 1 Byte 0 (B7) WRN (B6) RM (B5) Busy (B4) I4 (B3) I3 (B2) I2 (B1) I1 (B0) I0	Additional Information 1 Byte 1	Additional Information 1 Byte 2

It should be noted that the encoder is set up automatically so that it always returns Additional Information 1 with no data contents. An MRS is sent to the encoder to select which data contents should be included in Additional Information 1. An MRS code can also be used to select Additional Information 1, Additional Information 2 or no Additional Information to be sent from the encoder, but these commands must not be used. Although the contents of Additional Information 1 can be changed the encoder should always be in the state where it transmits only Additional Information 1.

BiSS, SC BiSS

It is possible to read or write to 8 bit registers in a BiSS device. The addressing range is 0 to 127 giving access to 128 registers. Two bytes should be written to the buffer for both read or write operations. Byte 0 contains the command in bit 7 (0 = read, 1= write) and the register address in bit 6 to bit 0. For reading Byte 1 can contain any value, for writing it should contain the data to be written.

Byte 0	Byte 1
Command + Address	Data

The response is always two bytes as shown below. Byte 0 is the same as Byte 0 in the request sent to the drive. For reading Byte 1 is the value read from the register and for writing it is always zero.

Byte 0	Byte 1
Command + Address	Data

Parameter	03.068 P1 User Comms Transmit Register		
Short description	Defines the value present in the user comms transmit register		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RW, NC, PT, BU		

See *P1 User Comms Enable* (03.067).

Parameter	03.069 <i>P1 User Comms Receive Register</i>		
Short description	Defines the value present in the user comms receive register		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RW, NC, PT, BU		

See *P1 User Comms Enable* (03.067).

Parameter	03.070 <i>P1 Position Feedback Signals</i>		
Short description	Shows the state of the signals from the position feedback device		
Mode	Open-Loop		
Minimum	0 (Display: 000000)	Maximum	63 (Display: 111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

P1 Position Feedback Signals (03.070) shows the state of the signals from the position feedback device as given in the table below where the signals are relevant for the type of device. *P1 Position Feedback Signals* (03.070) is only intended as a debugging aid.

<i>P1 Position Feedback Signals</i> (03.070) bits	Signals
0	A or F or Cos
1	B or D or R or Sin
2	Z
3	U
4	V
5	W

For Cos and Sin signals the relevant bits of *P1 Position Feedback Signals* (03.070) will be set when the signals are positive and cleared when the signals are negative.

Parameter	03.071 <i>P1 Error Detected</i>		
Short description	Indicates if an error has been detected with the position feedback device connected to the P1 position interface		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P1 Error Detected (03.071) is set if an error has been detected with the position feedback device connected to the P1 position interface. This parameter is useful if encoder trips have been disabled by setting bit 3 of *P1 Error Detection Level* (03.040). It should be noted that this bit is not set if specific trips are disabled with bits 0 to 2 of *P1 Error Detection Level* (03.040).

Parameter	03.073 <i>P1 Absolute Turns Recovery Enable</i>		
Short description	Set to 1 to allow turns information beyond the number of turns bits provided by the position feedback device connected to P1 to be stored on power-down and recovered at next power-up		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Absolute Turns Recovery Enable (03.073) can be used to remove the masking applied to *P1 Revolution/Pole Pitch Counter* (03.028) for any type of position feedback device. If *P1 Device Type* (03.038) is set to EnDat, SC.EnDat, SC.Hiperface, SSI, SC.SSI, BiSS, Option Slot 1, Option Slot 2, Option Slot 3 or Option Slot 4 then this parameter has an additional feature which allows turns bits beyond the number of turns bits provided by the position feedback device to be stored on power-down and then recovered on the next power-up. *P1 Revolution/Pole Pitch Counter* (03.028) is saved as a power-down save parameter. If *P1 Absolute Turns Recovery Enable* (03.073) = 0 the value saved at power-down is ignored on the next power-up and *P1 Revolution/Pole Pitch Counter* (03.028) is set up based on the information provided by the position feedback device. For example a device with 12 turns bits can define the position with up to 4096 turns. If *P1 Absolute Turns Recovery Enable* (03.073) = 1 the turns beyond those provide by the position feedback device are simulated from the saved value. This means that 65536 turns can be generated from a position feedback device with any number of turns bits. The following should be noted:

1. If the position feedback device moves by more than +/-1/4 of the range of the most significant turns bit while powered down the turns at power-up

will not be correct. For example a device with 12 turns bits must not move by more than the range defined by 10 turns bits, or a device with no turns bits must not move by more than 1/4 of a turn.

2. This feature is not applicable to linear position feedback devices.
3. If an SSI based device is being used then *P1 SSI Incremental Mode* (03.047) must be set to one.
4. The recovered turns bits are stored in *P1 Revolution/Pole Pitch Counter* (03.028). To reset the additional bits *P1 Absolute Turns Recovery Enable* (03.073) should be set to zero to remove the recovered turns bits. A parameter save should then be initiated using a value of 1 or 1001 in parameter mm.000 to save the contents of *P1 Revolution/Pole Pitch Counter* (03.028). Absolute turns recovery can then be selected again by setting *P1 Absolute Turns Recovery Enable* (03.073) to one.
5. Absolute turns recovery is not possible when *Low Under Voltage Threshold Select* (06.067) = 1 or *Backup Supply Mode Enable* (06.068) = 1 or *User Supply Select* (06.072) = 1. If absolute turns recovery is required when one of these modes is enabled then a user save (*Parameter mm.000* (mm.000) = 1 or 1001) should be performed before the drive is powered down.

Parameter	03.074 P1 Additional Configuration		
Short description	Provides additional configuration information for the position feedback device not included in the other set-up parameters.		
Mode	Open-Loop		
Minimum	0	Maximum	511116116
Default	0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P1 Additional Configuration (03.074) provides configuration information, not covered by the other set-up parameters, for the position feedback device connected to the P1 position feedback interface and is specific to the type of device being used.

P1 Device Type (03.038): BiSS, SC BiSS

This parameter is split into 3 fields as shown below.

Decimal Digits	9-6	5-3	2-0
	CRC polynomial	Rotary Turns Padding	Rotary Position Padding
Default	0067	000	000

CRC polynomial

The CRC polynomial is a bit representation of the terms of a polynomial used to generate the CRC applied to the position and the additional data transferred to/from the encoder via the BiSS communications channel. The standard value is 0067 which in hexadecimal is 0x0043, or in binary form is 0000 0000 0100 0011. The bits that are set to one show which terms exist in the polynomial. The standard value has bits 6, 1 and 0 set to one and gives the polynomial normally used with BiSS encoders which is X^6+X^1+1 . If the encoder uses a different polynomial then this can be selected with the four digits (9-6). The maximum value is 511 (0x01FF), and so a polynomial up to degree 10 can be set up.

Rotary Turns Padding

The turns, and position within a turn, provided by a rotary encoder may not completely fill the number of bits provided. The unfilled bits will normally be padded with zeros. The total number of bits provided for the turns including zero padding is given by *P1 Rotary Turns Bits* (03.033). The zero padding is given by decimal digits 5 to 3 of *P1 Additional Configuration* (03.074). Digits 4 and 3 give the number of bits and digit 5 specifies whether the padding is on the left (0) or on the right (1). For example a value of 104 would specify 4 padding bits on the right of the turns data. The default value of 000 specifies no padding. If the padding value is outside the range +/-16 then an *Encoder 14* is initiated. If right padding is specified the turns data will be shifted right by the number of padding bits as shown below. If left padding is specified it simply means that there are zeros to the left of the turns information, and so no adjustment is required. Therefore specifying left padding is optional. It is not possible to specify padding for linear encoders.

Data from encoder with 4 right padding bits

1	0	1	1	0	0	0	0
---	---	---	---	---	---	---	---

Data after adjustment for padding bits

0	0	0	0	1	0	1	1
---	---	---	---	---	---	---	---

Rotary Position Padding

The total number of bits provided for position within a turn is given by *P1 Comms Bits* (03.035) - *P1 Rotary Turns Bits* (03.033). The zero padding is given by decimal digits 2 to 0 of *P1 Additional Configuration* (03.074) in the same manner as is used for the turns padding. If left padding is specified the turns data will be shifted left by the number of padding bits as shown below. If right padding is specified it simply means that there are zeros to the right of the position information, and so no adjustment is required. Therefore specifying right padding is optional.

Data from encoder with 4 left padding bits

0	0	0	0	1	0	1	1
---	---	---	---	---	---	---	---

Data after adjustment for padding bits

1	0	1	1	0	0	0	0
---	---	---	---	---	---	---	---

P1 Device Type (03.038): Any other device type

This parameter has no effect.

Parameter	03.075 <i>Initialise Position Feedback</i>		
Short description	Set to 1 to re-initialise any position feedback device connected		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Initialise Position Feedback* (03.075) is set to one any position feedback devices connected to the drive position feedback interfaces or any position feedback category option modules will be re-initialised.

Parameter	03.076 <i>Position Feedback Initialized</i>		
Short description	Indicates the initialisation state of position feedback devices connected		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000)	Maximum	1023 (Display: 1111111111)
Default	0 (Display: 0000000000)	Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, NC, PT		

Position Feedback Initialized (03.076) contains flags that represent the initialisation state of position feedback devices connected to the drive position feedback interfaces or position feedback interfaces on position feedback category option modules. One indicates that the interface is initialised and zero indicates that the interface is not initialised. The flags are assigned as shown below.

Bit	Position feedback interface
0	P1 Drive
1	P2 Drive
2	P1 Option slot 1
3	P2 Option slot 1
4	P1 Option slot 2
5	P2 Option slot 2
6	P1 Option slot 3
7	P2 Option slot 3
8	P1 Option slot 4
9	P2 Option slot 4

If no option module, or an option module other than a position feedback category module, is fitted in an option slot then the relevant flag is always set to one. If an attempt is made to enable the drive when any of the flags are zero the drive initiates an *Encoder 7* trip. If a drive reset is initiated, the bits in *Position Feedback Initialized* (03.076) are checked, and if any position feedback devices are not initialised an attempt is made to initialise them.

The table below shows the initialisation process for different position feedback devices that can be connected to the drive.

Encoder types	Initialisation process
AB, FD, FR Resolver	None. Initialisation is immediate and is always successful. The position feedback is set to zero on initialisation.
AB Servo FD Servo FR Servo SC Servo	The absolute position used to control a motor can only be defined accurately after two different changes of state of the UVW commutation signals. Initialisation resets the system that ensures that the UVW signals alone will be used to define the motor position until the encoder has moved through two valid commutation signal state changes. Initialisation is immediate and is always successful. The position feedback is set to zero on initialisation.
SC	The SINCOS interpolation system must be initialised. Initialisation is immediate and is always successful. The position feedback is set to zero on initialisation.
SC Hiperface SC EnDat SC SSI	Auto-configuration if required except SC SSI. The absolute position must be obtained via comms. This may cause a large change in position feedback. The SINCOS interpolation system must be initialised. This may have a small effect on the position feedback.
EnDat BiSS SSI	Auto-configuration if required except SSI. The absolute position must be obtained via comms. This may cause a large change in position feedback.
SC SC	The absolute position used to control a motor is obtained from the sine and cosine signals provided for one revolution until the marker pulse occurs. The position obtained from the marker pulse is assumed to be a position of zero. Once a marker has occurred the incremental position is used and the single turn sine wave signals are ignored. When the position feedback device is initialised the single turn sine wave signals are used again until another marker event occurs. No part of the initialisation process affects the position feedback seen in parameters, except that the SINCOS interpolation system must be initialised which may have a small effect on the position feedback. Initialisation is immediate and is always successful.

Parameter	03.085 Encoder Simulation Source		
Short description	Defines the source parameter used for the encoder simulation		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	3.016	Units	
Type	16 Bit User Save	Update Rate	Reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Encoder Simulation Source (03.085) is used to select a parameter as the input to the encoder simulation system. If *Encoder Simulation Source* (03.085) is zero then no source is selected and the encoder simulation system is disabled. The encoder simulation output connections are shared with the P1 and P2 position feedback interfaces, and so encoder simulation may be disabled because the connections are not available. See *Encoder Simulation Status* (03.086) for details.

Any parameter can be selected as the source, but it is assumed that the input is a 16 bit value with a range from 0 to 65535 or from -32768 to 32767. The source parameter is treated differently depending on the value of *Encoder Simulation Mode* (03.088) as given in the table below.

Encoder Simulation Mode (03.088)	
Hardware (0)	<i>Encoder Simulation Source</i> (03.085) must be set to 3.029 for the output to be enabled and the position from the P1 position feedback interface is used and <i>P1 Position</i> (03.029) is the source.
Lines Per Rev (1) or Ratio (2)	<p>If <i>Encoder Simulation Source</i> (03.085) = 3.029 (i.e. <i>P1 Position</i> (03.029) is the source) then <i>P1 Position</i> (03.029) and <i>P1 Fine Position</i> (03.030) are combined as a 16 bit value with 16 bit fractional part as the input to the encoder simulation system, which gives additional output resolution if encoder simulation ratio is greater than unity.</p> <p>The encoder simulation system is intended to be used with a 16 bit source parameter. If the source of the encoder simulation system is not a 16 bit parameter then the drive uses the source parameter as follows.</p> <ul style="list-style-type: none"> • 1 bit parameter: Zero extended • 8 bit parameter: Sign extended if BU attribute is zero (signed), otherwise zero extended (unsigned) • 32 bit parameter: Only the least significant word is used.
SSI (3)	For SSI output mode the number of bits included in the output can be selected (see <i>Encoder Simulation Mode</i> (03.088) for details).

Although *Encoder Simulation Source* (03.085) is not a standard source parameter in common with other sources the actual source is only changed on drive reset.

Parameter	03.086 Encoder Simulation Status		
Short description	Displays the status of the encoder simulation		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Full
2	No Marker Pulse

The availability of the encoder simulation output on the 15 way connector on the drive is dependent on the type of feedback device selected with *P1 Device Type* (03.038). Priority is as follows from highest to lowest priority:

1. P1 position feedback interface
2. Encoder simulation output
3. P2 position feedback interface

Encoder Simulation Status (03.086) shows the status of the encoder simulation output.

0: None

The encoder simulation output is not enabled or is not available.

1: Full

Full encoder simulation with marker output is available.

2: No Marker

Encoder simulation without marker output is available.

Parameter	03.087 Encoder Simulation Sample Period		
Short description	Defines the sample period of the encoder simulation		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	2	Units	ms
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	0.25
1	1
2	4
3	16

The update rate of the encoder simulation system is nominally 250µs, i.e. default value of *Encoder Simulation Sample Period* (03.087), but if the update rate of the source parameter is different, the encoder simulation output will consist of bursts of pulses at the update rate of the parameter. To prevent this and to give a smooth output, the update rate can be adjusted with *Encoder Simulation Sample Period* (03.087). *Encoder Simulation Sample Period* (03.087) has no effect if hardware mode is selected, i.e. *Encoder Simulation Mode* (03.088) = 0.

Parameter	03.088 Encoder Simulation Mode		
Short description	Defines the mode of the encoder simulation		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Hardware
1	Lines Per Rev
2	Ratio
3	SSI

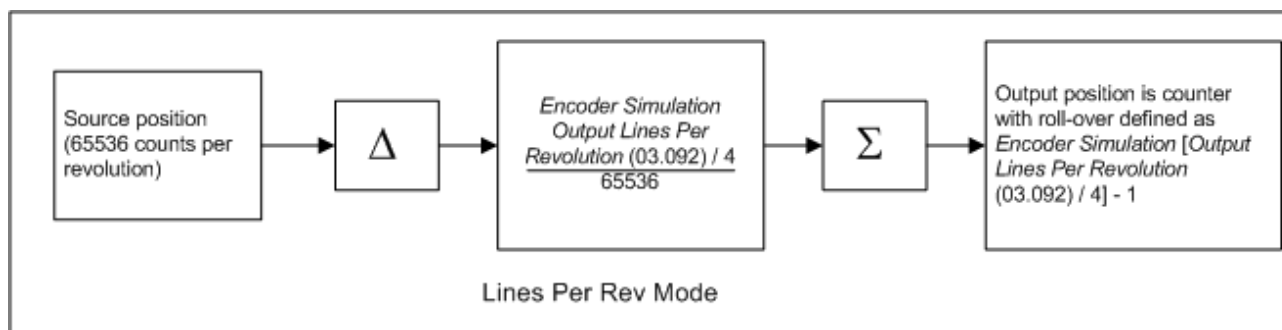

Encoder Simulation Mode (03.088) defines the encoder simulation output as incremental signals (AB, FD or FR) derived directly via hardware, incremental signals generated via software or SSI data generated via software.

0: Hardware

The encoder simulation output is derived directly in hardware from the P1 position feedback interface in the drive and the output is derived from the input with negligible delay. The ratio between the input at the P1 interface and the output is either unity or a limited number of binary divider ratios (see *Encoder Simulation Hardware Divider* (03.089)). Hardware mode only produces an output with AB, FD, FR, SC, SC Hiperface, SC EnDat or SC SSI type devices. It should be noted that with a SINCOS source device the output is based on the zero crossings of the sine wave inputs and does not include interpolation. If *Encoder Simulation Hardware Marker Lock* (03.090) = 0 the marker output is derived directly from the marker input. If *Encoder Simulation Hardware Marker Lock* (03.090) = 1 the incremental output signals are adjusted on each marker event so that the A and B are high with an AB type output, or F is high with an FD or FR type output. Marker locking is not recommended if the number of lines per revolution of the encoder simulation source combined with the ratio does not give an encoder simulation output with a multiple of 4 counts per revolution (i.e. between each output marker event) for AB signals, or a multiple of 2 counts for FD or FR signals, because this causes a count error in the system receiving these signals. The input marker pulse width is not adjusted to take account of the divider ratio, but is simply routed from the input to the output. Therefore the output marker pulse becomes shorter with respect to the output incremental signals as the divider ratio is increased.

1: Lines Per Rev

The encoder simulation output is derived via software from the selected source with a resolution defined by *Encoder Simulation Output Lines Per Revolution* (03.092) with a minimum delay of 250µs which may be extended if *Encoder Simulation Sample Period* (03.087) is set up for a longer sample period. Note that the number of output lines per revolution apply to a quadrature (AB) type device, and that if FD or FR mode are selected the number of lines per revolution are 2 x *Encoder Simulation Output Lines Per Revolution* (03.092). The output is derived by applying a ratio and output counter roll-over limit defined by *Encoder Simulation Output Lines Per Revolution* (03.092) as shown below. The output marker is produced when the output counter is zero.

If *P1 Position* (03.029) is selected as the source and *Encoder Simulation Incremental Mode Select* (03.091) = 0 then the input and output counters are synchronised at power-up and when the P1 position feedback interface becomes initialised, so that the output marker is synchronised with zero position for the P1 position feedback interface. For devices that support a marker, the effect of the marker on the position can be selected using *P1 Marker Mode* (03.031). At power-up and on device initialisation there will be a step change in position from zero to the actual position from the device and the pulses

necessary to make this change are produced at the encoder simulation output. If a marker event occurs that causes a step change in position, again the necessary pulses will be produced for this change of position. Where large sudden changes occur the maximum output frequency is limited to 500kHz, and so it may take some time for the output position to reach the input position. This mode of operation gives an initial position change from zero position and then follows all changes of position from that point onwards, and may be used to follow the absolute position of the device connected to the P1 position feedback interface.

If *P1 Position* (03.029) is selected as the source and *Encoder Simulation Incremental Mode Select* (03.091) = 1 then the encoder simulation output only follows the changes of source position. At power-up, on device initialisation and a marker event no additional pulses are produced to give the absolute position of the device related to zero position. The encoder simulation output markers is not synchronised to the source marker.

If a source other than *P1 Position* (03.029) is selected *Encoder Simulation Incremental Mode Select* (03.091) has no effect and the encoder simulation system always operates in absolute mode.

2: Ratio

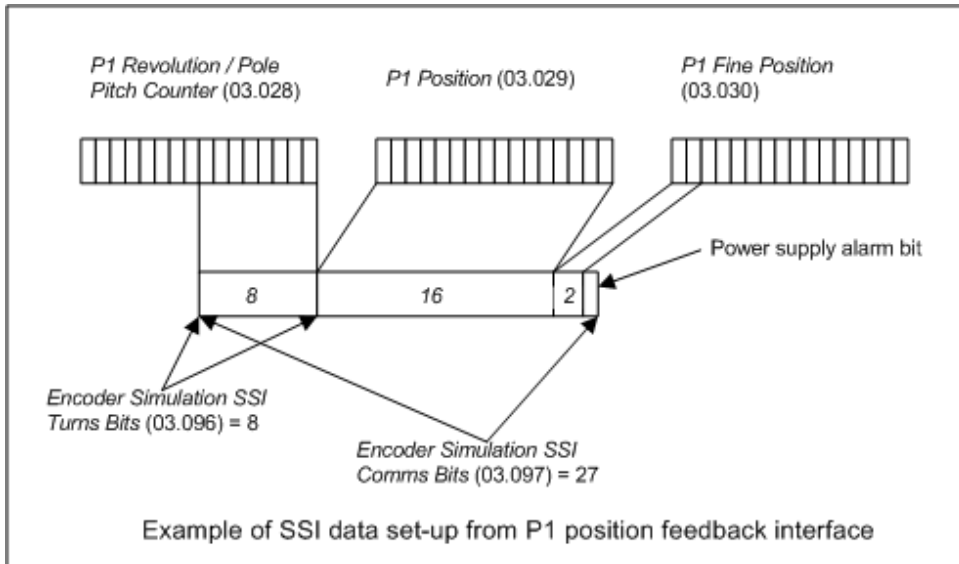

The encoder simulation is derived in the same way as described previously for *Encoder Simulation Mode* (03.088) = 1 (i.e. lines per rev mode), except that different parameters are used to set up the system giving more flexibility as shown below.

With the default settings (*Encoder Simulation Numerator* (03.093) = 65536, *Encoder Simulation Denominator* (03.094) = 65536 and *Encoder Simulation Output Roll-over Limit* (03.095) = 65535) the output produces a state change each time the source parameter changes by one. The numerator and denominator can be changed to provide a different ratio between the source and the output. Output markers are produced each time the output counter is zero and the counters are synchronised in the same way as for lines per rev mode. It is possible to control the roll-over limit of the output counter and hence the rate at which output markers are produced using *Encoder Simulation Output Roll-over Limit* (03.095). For example if the ratio is set to 1024/ 65536 and the roll-over limit is 1023 then one output marker is produced for every 1024 lines of output incremental signals. If the roll-over limit is changed to 512, then two output markers are produced for every 1024 lines of output incremental signals.

3: SSI

In this mode the B output becomes the clock input and the A output is the data output. If the source position is the P1 position feedback interface the data from the position feedback interface is transferred to the SSI output register once per sample period defined by *Encoder Simulation Sample Period* (03.087). An example is given below which shows how the data is aligned.

The SSI output is then clocked out from the register as shown in another example below which includes 15 bits of data.

It should be noted that the data is shifted out by a clock that is produced by the SSI master connected to the encoder simulation interface as the interface is emulating an SSI encoder. However, unlike an SSI encoder the position data is not sampled on the first edge of the clock, but is updated by the drive at

the rate defined by *Encoder Simulation Sample Period* (03.087). If the P1 position interface is being used as the source the power supply alarm bit (PS) is the inverse of the initialised flag in *Position Feedback Initialized* (03.076) related to this interface. The master can clock out as many bits of data as required, but once the power supply alarm bit has been produced the output will remain low. The SSI interface reset time (tm) of 20µs is required so that the interface can detect the end of the transmission and reset itself so that the output data begins again at the most significant bit. During this period the master should hold the clock line high. The master should not use a clock frequency of less than 50kHz or else spurious reset periods may be detected.

If any other parameter is used as the source the most significant M bits of the source parameter are used, where M = *Encoder Simulation SSI Comms Bits* (03.097) - 1. If the source parameter has less than M bits then trailing zeros are added. The power supply alarm bit is always zero in this mode.

Parameter			
03.089 Encoder Simulation Hardware Divider			
Short description	Defines the divider ratio between the device connected to the P1 interface and the encoder simulation output when hardware simulation mode is used		
Mode	Open-Loop		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If hardware mode is selected (i.e. *Encoder Simulation Mode* (03.088) = 0) then *Encoder Simulation Hardware Divider* (03.089) defines the divider ratio between the device connected to the P1 position feedback interface and the output as $1/2 \times \text{Encoder Simulation Hardware Divider}$ (03.089). The maximum allowed input frequency is 500kHz, and so the maximum output frequency with the highest ratio of unity is 500kHz.

Parameter			
03.090 Encoder Simulation Hardware Marker Lock			
Short description	Defines if the marker output is derived directly from the marker input		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Encoder Simulation Mode* (03.088).

Parameter			
03.091 Encoder Simulation Incremental Mode Select			
Short description	Set to 1 to select incremental mode for the encoder simulation		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Encoder Simulation Mode* (03.088).

Parameter			
03.092 Encoder Simulation Output Lines Per Revolution			
Short description	Defines the required lines per revolution when using the encoder simulation mode of Lines Per Rev		
Mode	Open-Loop		
Minimum	1	Maximum	16384
Default	1024	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Encoder Simulation Mode* (03.088).

Parameter			
03.093 Encoder Simulation Numerator			
Short description	Defines the numerator when using the encoder simulation mode of Ratio		
Mode	Open-Loop		
Minimum	1	Maximum	65536
Default	65536	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Encoder Simulation Mode* (03.088).

Parameter	03.094 Encoder Simulation Denominator		
Short description	Defines the denominator when using the encoder simulation mode of Ratio		
Mode	Open-Loop		
Minimum	1	Maximum	65536
Default	65536	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See Encoder Simulation Mode (03.088).

Parameter	03.095 Encoder Simulation Output Roll-over Limit		
Short description	Defines the roll-over limit of the output counter and hence the rate at which output markers are produced when using the encoder simulation mode of Ratio		
Mode	Open-Loop		
Minimum	1	Maximum	65535
Default	65535	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See Encoder Simulation Mode (03.088).

Parameter	03.096 Encoder Simulation SSI Turns Bits		
Short description	Defines the number of bits of the outputted SSI data that are used to represent turns information		
Mode	Open-Loop		
Minimum	0	Maximum	16
Default	16	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See Encoder Simulation Mode (03.088).

Parameter	03.097 Encoder Simulation SSI Comms Bits		
Short description	Defines the total number of bits of SSI data to be outputted		
Mode	Open-Loop		
Minimum	2	Maximum	48
Default	33	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See Encoder Simulation Mode (03.088).

Parameter	03.098 Encoder Simulation Output Mode		
Short description	Defines the format of the encoder simulation output		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	AB/Gray
1	FD/Binary
2	FR/Binary

Encoder Simulation Output Mode (03.098) is used to select the format of the encoder simulation output as given in the table below.

Encoder Simulation Mode (03.088)	Encoder Simulation Output Mode (03.098)	Format
Hardware (0), Lines Per Rev (1), Ratio (2)	AB/Gray	AB quadrature signals
Hardware (0), Lines Per Rev (1), Ratio (2)	FD/Binary	Frequency and direction signals
Hardware (0), Lines Per Rev (1), Ratio (2)	FR/Binary	Forward and reverse signals
SSI (3)	AB/Gray	The position data is in Gray code format. This does not include the "power supply" bit if present.
SSI (3)	FD/Binary, FR/Binary	The position data is in binary format

Parameter	03.100 F1 Freeze Trigger Source		
Short description	Used to select the source that generates trigger events for the F1 system		
Mode	Open-Loop		
Minimum	0	Maximum	6
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Digital Input 4
1	Digital Input 5
2	P1 Marker
3	P2 Marker
4	Common
5	P1 Zero
6	P2 Zero

F1 Freeze Trigger Source (03.100) is used to select the source that generates trigger events for the F1 system.

0, 1: Dig I/O 4, Dig I/O 5

Digital I/O 4 or Digital I/O 5 on the drive can be used as trigger sources. If the digital I/O is set up as an input, then trigger events will be produced on the relevant edge of the input signal. If the digital I/O is set up as an output, then trigger events will be produced on the relevant edge of the output signal.

2, 3: Z1, Z2

Z1 selects the P1 position feedback interface marker input as the trigger source and Z2 selects the P2 position feedback interface marker input as the trigger source. No trigger events will be produced unless the selected maker input is available.

4: Common

The output of the common freeze line is selected. If the output of the drive common freeze system is enabled (Bit 3 of *Common Freeze Mode* (03.112) = 1) then the drive common freeze system provides the freeze event triggers. If the output of the drive common freeze system is disabled the option module freeze line provides the freeze event triggers.

5, 6: P1 Zero, P2 Zero

A freeze event is triggered when the turns for the respective position feedback interface change (i.e. the feedback position passes through zero in either direction). The freeze position stored in *F1 Normalised Freeze Position* (03.103) or *F2 Normalised Freeze Position* (03.108) will include the turns associated with the zero position whichever direction the position changes. For example if the turns change from 4 to 5 or 5 to 4 the turns value stored is 5. This mode can be used as a substitute for a physical marker, with a position device that does not have one, to trigger an event to occur at the zero position of the feedback device. For example, it can be used with the AMC to start a CAM at the zero position of the feedback device. It should be noted that if P1 Zero is selected as the trigger source then *F1 Freeze Position Source* (03.102) has no effect and P1 is always used as the freeze position source. If P2 Zero is selected as the trigger source then *F1 Freeze Position Source* (03.102) has no effect and P2 is always used as the freeze position source. This is because these freeze trigger sources are only intended to capture the zero position of the device being used to give the zero position trigger event.

Parameter	03.101 F1 Freeze Mode		
Short description	Sets the mode used for the F1 freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Rising 1st
1	Falling 1st
2	Rising all
3	Falling all

0: Rising 1st

Freeze events are produced on the rising edge of the freeze trigger source. If the *F1 Freeze Flag* (03.104) is 0 then the first suitable edge produced by the trigger source causes the freeze position to be stored and the *F1 Freeze Flag* (03.104) to be set to 1. No further freeze events are possible until

the *F1 Freeze Flag* (03.104) has been cleared by the user.

1: Falling 1st

As for Rising 1st, but the falling edge is used to trigger freeze events.

2: Rising All

Freeze events are produced on the rising edge of the freeze trigger source. If the *F1 Freeze Flag* (03.104) is 0 then the first suitable edge produced by the trigger source causes the freeze position to be stored and the *F1 Freeze Flag* (03.104) to be set to 1. If further suitable edges are produced by the trigger source the freeze position is updated with the current position.

3: Falling All

As for Rising All, but the falling edge is used to trigger freeze events.

Parameter	03.102 <i>F1 Freeze Position Source</i>		
Short description	Defines the source position for the F1 freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	P1
1	P2
2	Time

F1 Freeze Position Source (03.102) defines the source for the F1 freeze system as follows:

P1 or P2

When a freeze event occurs, the position from the relevant position feedback interface within the drive (i.e. P1 or P2), including the effect of the marker (see *P1 Marker Mode* (03.031)), is stored and can be accessed as a 32 bit normalised value in *F1 Normalised Freeze Position* (03.103). For a digital incremental source (AB, FD, FR, AB Servo, FD Servo or FR Servo) the position is captured at the freeze event using a hardware system. For a resolver the freeze position is the position at the last 250us sample point. For all other position feedback devices the time of the freeze event is captured with hardware and then interpolation, based on the change of position during the previous nominal 250us period, is used to estimate the position at the freeze event.

Time

The time of the freeze event is stored with respect to the last datum used by the position feedback system and option modules fitted to the drive. These datum events occur at a nominal rate of 250us, but if the drive timing is being synchronised by the comms system in an option module then the actual timing may vary slightly depending on the accuracy of the clock providing the synchronisation. The time stored in *F1 Normalised Freeze Position* (03.103) is given as a proportion of the nominal 250us time period where 65536 corresponds to one nominal 250us time period. Note that the value may be positive or negative. Positive values give the time of an event that occurred after the last datum, but before the freeze information is processed. Negative values give the time of an event that occurred before the datum, but after the previous time when the freeze information was processed. The time of the freeze event could be used, for example, to determine the value of a virtual position being generated within an option module at the freeze event. The calculated value would only be meaningful if the freeze information is used during the period between the position datum before and after the freeze event, because the time is related to the datum before the freeze information is made available.

Parameter	03.103 <i>F1 Normalised Freeze Position</i>		
Short description	Displays the normalised position from the F1 freeze system		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *F1 Freeze Position Source* (03.102).

Parameter	03.104 <i>F1 Freeze Flag</i>		
Short description	Displays when a freeze event occurs from the F1 freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, PT		

The freeze flag is set when a freeze event occurs. If 0 is written to *F1 Freeze Flag* (03.104) the freeze flag is cleared.

Parameter	03.105 F2 Freeze Trigger Source		
Short description	User to select the source that generates trigger events for the F2 freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	6
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Digital Input 4
1	Digital Input 5
2	P1 Marker
3	P2 Marker
4	Common
5	P1 Zero
6	P2 Zero

F2 Freeze Trigger Source (03.105) is used to select the source that generates trigger events for the F2 freeze system.

0, 1: Dig I/O 4, Dig I/O 5

Digital I/O 4 or Digital I/O 5 on the drive can be used as trigger sources. If the digital I/O is set up as an input, then trigger events will be produced on the relevant edge of the input signal. If the digital I/O is set up as an output, then trigger events will be produced on the relevant edge of the output signal.

2, 3: Z1, Z2

Z1 selects the P1 position feedback interface marker input as the trigger source and Z2 selects the P2 position feedback interface marker input as the trigger source. No trigger events will be produced unless the selected maker input is available.

4: Common

The output of the common freeze line is selected. If the output of the drive common freeze system is enabled (Bit 3 of *Common Freeze Mode* (03.112) = 1) then the drive common freeze system provides the freeze event triggers. If the output of the drive common freeze system is disabled the option module freeze line provides the freeze event triggers.

5, 6: P1 Zero, P2 Zero

A freeze event is triggered when the turns for the respective position feedback interface change (i.e. the feedback position passes through zero in either direction). The freeze position stored in *F1 Normalised Freeze Position* (03.103) or *F2 Normalised Freeze Position* (03.108) will include the turns associated with the zero position whichever direction the position changes. For example if the turns change from 4 to 5 or 5 to 4 the turns value stored is 5. This mode can be used as a substitute for a physical marker with a position device that does not have one to trigger an event to occur at the zero position of the feedback device. For example, it can be used with the AMC to start a CAM at the zero position of the feedback device. It should be noted that if P1 Zero is selected as the trigger source then *F1 Freeze Position Source* (03.102) has no effect and P1 is always used as the freeze position source. If P2 Zero is selected as the trigger source then *F1 Freeze Position Source* (03.102) has no effect and P2 is always used as the freeze position source. This is because these freeze trigger sources are only intended to capture the zero position of the device being used to give the zero position trigger event.

Parameter	03.106 F2 Freeze Mode		
Short description	Defines the mode for the F2 freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Rising 1st
1	Falling 1st
2	Rising all
3	Falling all

0: Rising 1st

Freeze events are produced on the rising edge of the freeze trigger source. If the *F2 Freeze Flag* (03.109) is 0 then the first suitable edge produced by the trigger source causes the freeze position to be stored and the *F2 Freeze Flag* (03.109) to be set to 1. No further freeze events are possible until the *F2 Freeze Flag* (03.109) has been cleared by the user.

1: Falling 1st

As for Rising 1st, but the falling edge is used to trigger freeze events.

2: Rising All

Freeze events are produced on the rising edge of the freeze trigger source. If the *F2 Freeze Flag* (03.109) is 0 then the first suitable edge produced by the trigger source causes the freeze position to be stored and the *F2 Freeze Flag* (03.109) to be set to 1. If further suitable edges are produced by the trigger source the freeze position is updated with the current position.

3: Falling All

As for Rising All, but the falling edge is used to trigger freeze events.

Parameter	03.107 F2 Freeze Position Source		
Short description	Defines the source position for the F2 freeze system		
Mode	Open-Loop

Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	P1
1	P2
2	Time

F2 Freeze Position Source (03.107) defines the source for the F1 freeze system as follows:

P1 or P2

When a freeze event occurs, the position from the relevant position feedback interface within the drive (i.e. P1 or P2), including the effect of the marker (see *P1 Marker Mode* (03.031)), is stored and can be accessed as a 32 bit normalised value in *F2 Normalised Freeze Position* (03.108). For a digital incremental source (AB, FD, FR, AB Servo, FD Servo or FR Servo) the position is captured at the freeze event using a hardware system. For a resolver the freeze position is the position at the last 250us sample point. For all other position feedback devices the time of the freeze event is captured with hardware and then interpolation, based on the change of position during the previous nominal 250us period, is used to estimate the position at the freeze event.

Time

The time of the freeze event is stored with respect to the last datum used by the position feedback system and option modules fitted to the drive. These datum events occur at a nominal rate of 250us, but if the drive timing is being synchronised by the comms system in an option module then the actual timing may vary slightly depending on the accuracy of the clock providing the synchronisation. The time stored in *F2 Normalised Freeze Position* (03.108) is given as a proportion of the nominal 250us time period where 65536 corresponds to one nominal 250us time period. Note that the value may be positive or negative. Positive values give the time of an event that occurred after the last datum, but before the freeze information is processed. Negative values give the time of an event that occurred before the datum, but after the previous time when the freeze information was processed. The time of the freeze event could be used, for example, to determine the value of a virtual position being generated within an option module at the freeze event. The calculated value would only be meaningful if the freeze information is used during the period between the position datum before and after the freeze event, because the time is related to the datum before the freeze information is made available.

Parameter	03.108 F2 Normalised Freeze Position		
Short description	Displays the normalised position from the F2 freeze system		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *F2 Freeze Position Source* (03.107).

Parameter	03.109 F2 Freeze Flag		
Short description	Displays when a freeze event occurs from the F2 freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, PT		

The freeze flag is set when a freeze event occurs. If 0 is written to *F2 Freeze Flag* (03.109) the freeze flag is cleared.

Parameter	03.110 Common Freeze Source 1		
Short description	Defines source 1 for the common freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Digital Input 4
1	Digital Input 5
2	P1 Marker
3	P2 Marker
4	Disabled

See *F1 Freeze Trigger Source* (03.100) or *F2 Freeze Trigger Source* (03.105). It should be noted that if the Disabled option is selected then the input is set to a one.

Parameter	03.111 Common Freeze Source 2		
Short description	Defines source 2 for the common freeze system		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Digital Input 4
1	Digital Input 5
2	P1 Marker
3	P2 Marker
4	Disabled

See *F1 Freeze Trigger Source* (03.100) or *F2 Freeze Trigger Source* (03.105). It should be noted that if the Disabled option is selected then the input is set to a one.

Parameter	03.112 Common Freeze Mode		
Short description	Defines the mode used for the common freeze system		
Mode	Open-Loop		
Minimum	0 (Display: 0000)	Maximum	15 (Display: 1111)
Default	0 (Display: 0000)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW		

The common freeze system can be used to logically combine two freeze trigger sources. The switches in the common freeze system are controlled by the bits in *Common Freeze Mode* (03.112) as defined in the table below.

Bit	Function
0	Source 1 input invert 1
1	Source 2 input invert
2	Output invert
3	Output enable

Therefore the value defined bits 2 to 0 can be used to generate various logic functions as given in the table below.

Bits 2 to 0	Function
0	Source1 AND Source2
1	NOT(Source1) AND Source2
2	Source1 AND NOT(Source2)
3	Source1 NOR Source2
4	Source1 NAND Source2
5	NOT(Source1) NAND Source2
6	Source1 NAND NOT(Source2)
7	Source1 OR Source2

Parameter	03.113 Freeze Input States		
Short description	Displays the level of the selected freeze inputs		
Mode	Open-Loop		
Minimum	0 (Display: 00)	Maximum	3 (Display: 11)
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

The bits in *Freeze Input States* (03.113) show the level of the selected freeze trigger inputs. Bit 0 corresponds to F1 freeze input and bit 1 corresponds to F2 freeze input. It should be noted that if the trigger option is P1Zero or P2Zero there is no hardware trigger input, and so the relevant bit is always zero.

Parameter	03.118 P1 Thermistor Type		
Short description	Defines the thermistor type for the P1 interface		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	DIN44082
1	KTY84
2	0.8mA
3	Encoder

P1 Thermistor Type (03.118) defines the operating mode of the P1 thermistor input.

P1 Thermistor Type (03.118)	Compatible devices
0: DIN44082	Three thermistors in series as specified in DIN44082 standard
1: KTY84	KTY84 PTC thermistor
2: 0.8mA	Any device
3: Encoder	EnDat 2.2 encoder

All except 3(Encoder)

If a device is connected between the pin 15 of the encoder interface and 0V a current source will pass 0.8mA through the device with a maximum voltage of approximately 3.8V (i.e. maximum resistance of approximately 4750 Ohms). The resistance of the device is calculated and displayed in *P1 Thermistor Feedback* (03.119). If *P1 Thermistor Type* (03.118) is set to select KTY84 the temperature is also calculated and written to *P1 Thermistor Temperature* (03.122). Note that DIN44082 mode and 0.8mA mode operate in exactly the same way.

3 (Encoder)

If an EnDat 2.2 encoder which supports external temperature feedback is connected to the P1 position feedback interface then it is possible to obtain the measured temperature from the encoder if *P1 Thermistor Type* (03.118) is set to 3. The temperature is displayed in *P1 Thermistor Temperature* (03.122) and a resistance equivalent to that for a KTY84 device is displayed in *P1 Thermistor Feedback* (03.119). The drive does not check if an external device is connected, but short circuit protection can be selected to detect if the device is not connected because the resistance will appear as zero.

Parameter	03.119 P1 Thermistor Feedback		
Short description	Displays the resistance of the thermistor on the P1 interface		
Mode	Open-Loop		
Minimum	0	Maximum	5000
Default		Units	Ω
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *P1 Thermistor Type* (03.118).

Parameter	03.120 P1 Thermistor Trip Threshold		
Short description	Defines the thermistor trip threshold for the P1 interface		
Mode	Open-Loop		
Minimum	0	Maximum	5000
Default	3300	Units	Ω
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *P1 Thermistor Fault Detection* (03.123).

Parameter	03.121 P1 Thermistor Reset Threshold		
Short description	Defines the thermistor reset threshold for the P1 interface		
Mode	Open-Loop		
Minimum	0	Maximum	5000
Default	1800	Units	Ω
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *P1 Thermistor Fault Detection* (03.123).

Parameter	03.122 P1 Thermistor Temperature		
Short description	Displays the temperature of the device based on the resistance to temperature characteristic for the specified device		
Mode	Open-Loop		
Minimum	-50	Maximum	300
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *P1 Thermistor Type* (03.118).

Parameter	03.123 P1 Thermistor Fault Detection		
Short description	Defines the fault detection for the P1 thermistor input		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	Temperature
2	Temp or Short

Defines the fault detection for the P1 thermistor input:

P1 Thermistor Fault Detection (03.123)	Fault detection
0: None	No detection active
1: Temperature	Over temperature detection
2: Temp and short	Over temperature and short circuit detection

If over temperature detection is enabled a *Thermistor.001* trip is initiated if *P1 Thermistor Feedback* (03.119) is above the level defined by *P1 Thermistor Trip Threshold* (03.120). The trip cannot be reset until *P1 Thermistor Feedback* (03.119) is below *P1 Thermistor Reset Threshold* (03.121).

If short circuit detection is enabled then a *Th Short Circuit.001* is initiated if *P1 Thermistor Feedback* (03.119) is below 50 Ohms.

Parameter	03.127 P2 Speed Feedback		
Short description	Displays the speed feedback from the P2 interface		
Mode	Open-Loop		
Minimum	-VM_SPEED	Maximum	VM_SPEED
Default		Units	
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

Provided the set-up parameters for the position feedback device connected to the drive P2 position interface are correct *P2 Speed Feedback* (03.127) shows the speed derived from the feedback. The speed is given in mm/s if *P2 Linear Feedback Select* (03.151) = 1 and *Linear Speed Select* (01.055) = 1, otherwise it is given in rpm. The value shown is measured over a 16ms sliding window period, and so the ripple in this value is as defined for *Speed Feedback* (03.002).

Parameter	03.128 P2 Revolution/Pole Pitch Counter		
Short description	Displays the revolution/pole pitch counter from the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

P2 Revolution/Pole Pitch Counter (03.128), *P2 Position* (03.129) and *P2 Fine Position* (03.130) combined give the encoder position with a resolution of $1/2^{32}$ of a revolution/pole pitch as a 48 bit number. If a rotary position feedback device is being used (*P2 Linear Feedback Select* (03.151) = 0) then these quantities relate directly to the rotary position of the feedback device. If a linear feedback device is used then one revolution or pole pitch relates to the distance given by *P2 Pole Pair Pitch* (03.155).

See *P1 Revolution/Pole Pitch Counter* (03.028) for more information.

Parameter	03.129 P2 Position		
Short description	Displays the position feedback from the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *P2 Revolution/Pole Pitch Counter* (03.128).

Parameter	03.130 P2 Fine Position		
Short description	Displays the fine position from the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *P2 Revolution/Pole Pitch Counter* (03.128).

Parameter	03.131 P2 Marker Mode		
Short description	Defines the marker mode for the P2 interface		
Mode	Open-Loop		
Minimum	0 (Display: 0000)	Maximum	15 (Display: 1111)
Default	4 (Display: 0100)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW		

P2 Device type (03.138): AB, FD, FR

Each position feedback device produces incremental signals which are counted in hardware. If *P2 Marker Mode* (03.131) = 0 the following occurs when a marker event is produced by the Z1 input:

1. *P2 Position* (03.129) and *P2 Fine Position* (03.130) are reset to zero.
2. The bits in *P2 Normalised Position* (03.158) related to *P2 Position* (03.129) and *P2 Fine Position* (03.130) are reset to zero
3. *P2 Marker Flag* (03.132) is set to one.

The marker is a hardware function, and so the position appears as though it is reset at the marker event time even if this is between control system sample points. It should be noted that the marker event occurs on the rising edge of the marker pulse if the position change over the last sample was positive or on the falling edge if the position change over the last sample was negative. This ensures that the marker event occurs at the same physical location for either direction of rotation.

The action taken when a marker event occurs can be modified by setting the bits of *P2 Marker Mode* (03.131) as described in the table below.

Bit	Effect of setting bit to one
0	No action is taken unless the marker flag is zero before the marker event occurs
1	<i>P2 Revolution/Pole Pitch Counter</i> (03.128) and the whole of <i>P2 Normalised Position</i> (03.158) are also set to zero on a marker event
2	<i>P2 Revolution/Pole Pitch Counter</i> (03.128), <i>P2 Position</i> (03.129), <i>P2 Fine Position</i> (03.130) and the related part of <i>P2 Normalised Position</i> (03.158) are not reset. (This overrides bit 1.) <i>P2 Normalised Position</i> (03.158) is transferred to <i>P2 Normalised Marker Position</i> (03.159) and <i>P2 Marker Flag</i> (03.132) is set to one.
3	This bit in has not effect.

The marker input can be used for a standard type marker function or alternatively it can be used as an additional freeze input for the P1 position feedback interface.

P2 Device type (03.138): Any other device type

The marker function cannot be used and *P2 Marker Mode* (03.131) has no effect.

Parameter	03.132 P2 Marker Flag		
Short description	Indicates when a marker event occurs		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

P2 Marker Flag (03.132) is set to one when a marker event occurs. The flag must be cleared by the user.

Parameter	03.133 P2 Rotary Turns Bits		
Short description	Defines the number of rotary turns bit for the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	16
Default	16	Units	
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Rotary Turns Bits (03.133) only has any effect if the position feedback interface is being used with a rotary device (i.e. *P2 Linear Feedback Select* (03.151) = 0).

P2 Device type (03.138): EnDat, BISS, SSI

P2 Rotary Turns Bits (03.133) is used to determine the number of bits within the comms messages from the position feedback device that represent turns. For a single turn encoder *P2 Rotary Turns Bits* (03.133) must be set to zero. It should be noted that some SSI encoders include leading zeros before the turns information and in this case the number of turns bits should include the leading zeros. The most significant bits in *P1 Revolution/Pole Pitch Counter* (03.028) that are not included in the turns information provided by the encoder comms are held at zero. If *P2 Rotary Turns Bits* (03.133) = 0 (single turn encoder) the whole of *P2 Revolution/Pole Pitch Counter* (03.128) is held at zero.

P2 Device type (03.138): Any other device type

It is sometimes desirable to mask off the most significant bits of *P2 Revolution/Pole Pitch Counter* (03.128), but this does not have to be done for the drive to function correctly. If *P2 Rotary Turns Bits* (03.133) = 0 the whole of *P2 Revolution/Pole Pitch Counter* (03.128) is held at zero. If *P2 Rotary Turns Bits* (03.133) has any other value it indicates the number of bits in *P2 Revolution/Pole Pitch Counter* (03.128) that are not held at zero. For example, if *P2 Rotary Turns Bits* (03.133) = 5, then *P2 Revolution/Pole Pitch Counter* (03.128) counts up to 31 before being reset.

Parameter	03.134 P2 Rotary Lines Per Revolution		
Short description	Defines the number of rotary lines per revolution for the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	100000
Default	1024	Units	
Type	32 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Rotary Lines Per Revolution (03.134) only has any effect if the position feedback interface is being used with a rotary device (i.e. *P2 Linear Feedback Select* (03.151) = 0).

P2 Device type (03.138): AB

P2 Rotary Lines Per Revolution (03.134) should be set to the number of lines per revolution for the encoder connected to the P1 position feedback interface.

P2 Device type (03.138): FD, FR

P2 Rotary Lines Per Revolution (03.134) should be set to the number of lines per revolution for the encoder connected to the P1 position feedback interface multiplied by 2.

P2 Device type (03.138): Any other device type

P2 Rotary Lines Per Revolution (03.134) has no effect.

Parameter	03.135 P2 Comms Bits		
Short description	Defines the total number of bits of position information in the comms message from the encoder on the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	48
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Device type (03.138): EnDat, SSI, BiSS

P2 Comms Bits (03.135) should be set to the total number of bits of position information in the comms message from the encoder. If SSI communications is being used this should include any leading or trailing zeros and the power supply alarm bit if present.

P2 Device type (03.138): Any other device type

P2 Comms Bits (03.135) has no effect.

Parameter	03.137 P2 Comms Baud Rate		
Short description	Defines the baud rate used for encoder communications		
Mode	Open-Loop		
Minimum	0	Maximum	8
Default	2	Units	Baud
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	100k
1	200k
2	300k
3	400k
4	500k
5	1M
6	1.5M
7	2M
8	4M

P2 Comms Baud Rate (03.137) defines the baud rate used for encoder communications. Restrictions are applied to the baud rate for different feedback devices, and so the baud rate may be different to the parameter value.

P2 Device type (03.138): EnDat, BiSS, SSI

Any baud rate that is within the range specified for the encoder may be used. The line delay is measured during initialisation, and used to compensate this delay during communications with the encoder. Therefore there is no timing based restriction on the length of the cable between the position feedback interface and the encoder. However, care should be taken to ensure that the wiring arrangement and the type of cable used are suitable for the selected baud rate and the distance between the position interface and the encoder. See *P2 Low Speed Update Rate Active* (03.163) for more details on timing restrictions related to the drive sample times.

P2 Device type (03.138): Any other device

P2 Comms Baud Rate (03.137) has no effect.

Parameter	03.138 P2 Device type		
Short description	Set this to the feedback device type connected to the P2 position interface		
Mode	Open-Loop		
Minimum	0	Maximum	6
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	AB
2	FD
3	FR
4	EnDat
5	SSI
6	BiSS

If *P2 Device type* (03.138) = Disabled, the P2 position feedback interface is disabled and does not provide any position feedback.

See *P1 Device Type* (03.038) for more information on the different position feedback device types.

Parameter	03.140 <i>P2 Error Detection Level</i>		
Short description	Used to enable or disable position feedback trip functions		
Mode	Open-Loop		
Minimum	0 (Display: 00000)	Maximum	31 (Display: 11111)
Default	1 (Display: 00001)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW		

This parameter can be used to enable or disable position feedback trip functions as follows:

Bit	Function
0	Not used with the P2 position interface.
1	Not used with the P2 position interface.
2	Enable SSI power supply alarm bit monitor (indicated by trip <i>Encoder 6</i>).
3	Disable trips <i>Encoder 1</i> to <i>Encoder 6</i> .
4	Disable trip <i>Encoder 7</i> .

Bits 3 and 4 do not prevent the device from becoming un-initialised. The trip is suppressed, but the device is still un-initialised and this is indicated by the appropriate bit for the position feedback interface in *Position Feedback Initialized* (03.076).

Encoder trips

The following table shows trips that can be initiated that are related to the position feedback interface P2. The sub-trip number is 2 for the drive P2 position feedback interface.

Drive trip	Encoders	Reason for error
<i>Encoder 4</i>	EnDat, BiSS	Comms timeout
<i>Encoder 5</i>	EnDat, BiSS	Checksum/CRC error
	SSI	Not ready at start of position transfer (i.e. data input not one)
<i>Encoder 6</i>	EnDat, BiSS	The encoder has indicated an error
	SSI	Power supply alarm bit active
<i>Encoder 7</i>	EnDat, BiSS, SSI	An attempt has been made to enable the drive, but a position feedback device is not initialised
<i>Encoder 8</i>	EnDat, SSI, BiSS	<i>Maximum Switching Frequency</i> (05.018), <i>P2 Device type</i> (03.138), <i>P2 Comms Bits</i> (03.135), <i>P2 Comms Baud Rate</i> (03.137), <i>P2 Calculation Time</i> (03.160), <i>P2 Recovery Time</i> (03.161), <i>P2 Line Delay Time</i> (03.162) and <i>P2 User Comms Enable</i> (03.167) are used to determine the time taken for the communications exchange with the encoder. If this time exceeds 250µs an <i>Encoder 8</i> trip is initiated.
<i>Encoder 9</i>	All	Speed feedback selected from an option slot that does not have a position feedback category option module fitted
<i>Phasing Error</i>	All	Incorrect encoder phasing ¹
<i>Encoder 12</i>	BiSS	The encoder could not be identified during auto-configuration

1. Incorrect encoder phasing is detected if the motor reaches half of the speed defined by VM_SPEED_FREQ_REF[MAX] and the phasing error is large enough for the motor to accelerate uncontrollably.

Wire-break detection

It may be important to detect a break in the connections between the drive and the position feedback device. This feature is provided for most position feedback devices either directly or indirectly as listed below.

Device	Detection method	Trip produced
AB, FD, FR	There is no wire break detection of the A2, B2, and Z2 signals on the P2 position interface.	None
EnDat, BiSS	Wire break in the comms link is detected by a CRC or timeout error.	Encoder 4, Encoder 5
SSI	Wire break detection in the comms is difficult with these devices. However, if power supply alarm bit monitoring is enabled the drive will be looking for a one at the start of the message and a zero to indicate that the power supply is okay. If the clock stops or the data line is disconnected the data input to the drive may stay in one state or the other and cause a trip.	Encoder 5, Encoder 6

Parameter	03.141 P2 Auto-configuration Select		
Short description	Set this parameter to enable auto-configuration of EnDat and BiSS feedback devices		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Enabled

P2 Device type (03.138): EnDat, BiSS

If auto-configuration has not been disabled (i.e. *P2 Auto-configuration Select* (03.141) = 0) then during position feedback initialisation the encoder is interrogated to determine whether the encoder is a rotary or linear encoder and *P2 Linear Feedback Select* (03.151) is set up appropriately. Then the following parameters are set up based on information from the encoder:

Rotary	Linear
<i>P2 Rotary Turns Bits</i> (03.133)	<i>P2 Linear Comms Pitch</i> (03.152)
<i>P2 Rotary Lines Per Revolution</i> (03.134)	<i>P2 Linear Line Pitch</i> (03.153)
<i>P2 Comms Bits</i> (03.135)	<i>P2 Comms Bits</i> (03.135)
	<i>P2 Linear Comms And Line Pitch Units</i> (03.154)

The following actions are also taken to set up the timing for the encoder.

Comms Protocol	Actions taken
EnDat 2.1	<i>P2 Calculation Time</i> (03.160) = From the encoder <i>P2 Recovery Time</i> (03.161) = 30µs Line delay measured and result written to <i>P2 Line Delay Time</i> (03.162)
EnDat 2.2	<i>P2 Calculation Time</i> (03.160) = From the encoder <i>P2 Recovery Time</i> (03.161) = 4µs and the recovery time within the encoder is set up to the shortest value of 3.75µs if the <i>P2 Comms Baud Rate</i> (03.137) is 1M or more. Line delay measured and result written to <i>P2 Line Delay Time</i> (03.162)
BiSS	<i>P2 Recovery Time</i> (03.161) = 12µs Line delay measured and result written to <i>P2 Line Delay Time</i> (03.162)
SSI	Line delay measured and result written to <i>P2 Line Delay Time</i> (03.162)

If *P2 Auto-configuration Select* (03.141) = 1 then *P2 Comms Baud Rate* (03.137) is set to the minimum value that will give a total message transfer time of less than 62µs, so that the transfer will occur at the fast update rate with the minimum baud rate. It should be noted that the value of *P2 User Comms Enable* (03.167) is taken into account as this may affect the message time.

Once these parameters have been set up it should be possible for the drive to operate correctly with the encoder. The drive repeatedly attempts to initialise the encoder, including auto-configuration which is part of this process, until it is successful. Therefore if auto-configuration has not been successful by the time the drive is enabled because the drive cannot establish communications an *Encoder 7* trip occurs. For BiSS encoders the drive must identify the encoder model number to perform auto-configuration. If communications is established, but the drive cannot recognise the encoder model an *Encoder 12* trip is produced immediately.

If auto-configuration is disabled (i.e. *P2 Auto-configuration Select* (03.141) = 1) then none of the above actions are carried out except for the line delay measurement.

P2 Device type (03.138): All other device types

P2 Auto-configuration Select (03.141) has no effect.

Parameter	03.142 P2 Feedback Filter		
Short description	Defines the time period for a sliding window filter that may be applied to the feedback taken from the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	5
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	1ms
2	2ms
3	4ms
4	8ms
5	16ms

P2 Feedback Filter (03.142) defines the time period for a sliding window filter that may be applied to the feedback taken from the drive P2 position feedback interface. This is particularly useful in applications where the drive encoder is used to give speed feedback for the speed controller and where the load includes a high inertia, and so the speed controller gains are very high. Under these conditions, without a filter on the feedback, it is possible for the speed loop output to change constantly from one current limit to the other and lock the integral term of the speed controller.

Parameter	03.143 P2 Maximum Reference		
Short description	Defines the maximum speed reference from the P2 interface		
Mode	Open-Loop		
Minimum	0	Maximum	35940
Default	1500	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

The speed feedback from the drive P1 position feedback interface can be used as a source to control a parameter. The speed feedback is scaled to give a value as a percentage of *P2 Maximum Reference* (03.143) in 0.1% units which is displayed in *P2 Reference* (03.145). The value is then scaled by the *P2 Reference Scaling* (03.144) and then routed to the destination defined by *P2 Reference Destination* (03.146).

Normally the destination is updated every 4ms, but if the destination is the *Hard Speed Reference* (03.022), *P2 Maximum Reference* (03.143) = VM_SPEED_FREQ_REF[MAX] and *P2 Reference Scaling* (03.144) = 1.000 it is updated every 250µs. Although the hard speed reference is updated every 250µs internally a value in rpm or mm/s is written to *Hard Speed Reference* (03.022) every 4ms for indication only. It should be noted that if the fast update method is used the resolution of the speed feedback derived from the position feedback device defines the resolution of the hard speed reference and that any ripple on the feedback will be present on the hard speed reference (see *Speed Feedback* (03.002)).

Parameter	03.144 P2 Reference Scaling		
Short description	Defines the scaling applied to the P2 reference		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *P2 Maximum Reference* (03.143).

Parameter	03.145 P2 Reference		
Short description	Displays the value in P2 reference		
Mode	Open-Loop		
Minimum	-100.0	Maximum	100.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, ND, NC, PT		

See *P2 Maximum Reference* (03.143).

Parameter	03.146 P2 Reference Destination		
Short description	Defines the destination parameter for P2 reference		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *P2 Maximum Reference* (03.143).

Parameter	03.147 P2 SSI Incremental Mode		
Short description	Set to 1 to enable SSI incremental mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Device type (03.138): SSI

If *P2 SSI Incremental Mode* (03.147) = 0 the complete absolute position is read at each sample. Care should be taken when using this mode as some unwanted effects can occur when the encoder passes through the boundary between its maximum position and zero. In this mode the encoder can be used for motor control provided at least 6 bits of turns information are provided by the encoder otherwise an over speed trip will be produced as the position passes over the maximum position to zero boundary. *P2 Normalised Position* (03.158) can be used for position control over this boundary provided the normalised turns bits are set up so that the normalised positions do not contain turns information that is not available from the encoder. As the SSI format does not include any error checking it is not possible to detect if the position data has been corrupted by noise. The benefit of using the absolute position directly from an SSI encoder is that even if the encoder communications are disturbed by noise and position errors occur, the position will always recover the correct position after the disturbance has ended.

If *P2 SSI Incremental Mode* (03.147) = 1 the absolute position is only taken from the encoder during initialisation. The change of position over each sample is then accumulated to determine the position. This method always gives 16 bits of turns information that can always be used without jumps in position whatever value is used as the turns bits for normalisation. If noise corrupts the data from an SSI encoder it is possible to have apparent large change of position, and this can result in the turns information becoming and remaining corrupted until the encoder is re-initialised.

If an SSI encoder is used, but is not powered from the drive, and the encoder is powered up after the drive, it is possible that the first change of position detected could be large enough to cause the problems described above. This can be avoided if the encoder interface is initialised with *Initialise Position Feedback* (03.075) after the encoder has powered up. If the encoder includes a power supply alarm bit, the power supply monitor should be enabled. This will ensure that the drive remains tripped until the encoder is powered up and the action of resetting the trip will reinitialise the encoder interface.

P2 Device type (03.138): All other device types

P2 SSI Incremental Mode (03.147) has no effect.

Parameter	03.148 P2 SSI Binary Mode		
Short description	Set to 1 to enable SSI binary mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Device type (03.138): SSI

SSI encoders normally use Gray code data format. However, some encoders use binary format which may be selected by setting *P2 SSI Binary Mode* (03.148) to one.

P2 Device type (03.138): All other device types

P2 SSI Binary Mode (03.148) has no effect.

Parameter	03.149 P2 Additional Power-up Delay		
Short description	Defines an additional delay for when any attempt is made to communicate to the device P2		
Mode	Open-Loop		
Minimum	0.0	Maximum	25.0
Default	0.0	Units	s
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

When the position feedback is initialised, at power-up or at any other time, a delay is included before the information from the feedback device is used or any attempt is made to communicate with the device. *P2 Additional Power-up Delay* (03.149) defines an additional delay that is added to the minimum delay. See *P1 Additional Power-up Delay* (03.049) for the minimum delays for the different position feedback device types.

Parameter	03.150 P2 Feedback Lock		
Short description	Set to 1 to prevent the position feedback parameters for P2 being updated		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *P2 Feedback Lock* (03.150) = 1 then *P2 Revolution/Pole Pitch Counter* (03.128), *P2 Position* (03.129) and *P2 Fine Position* (03.130) are not updated. If *P2 Feedback Lock* (03.150) = 0 then these parameters are updated normally.

Parameter	03.151 P2 Linear Feedback Select		
Short description	Set to 1 to configure the P2 interface to operate with a linear position feedback device		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

If *P2 Linear Feedback Select* (03.151) = 0 then the drive P1 position feedback interface is configured to operate with a rotary position feedback device. *P2 Rotary Turns Bits* (03.133) and *P2 Rotary Lines Per Revolution* (03.134) should be used to set up the position feedback interface.

If *P2 Linear Feedback Select* (03.151) = 1 then the position feedback interface is configured to operate with a linear position feedback device. *P2 Linear Comms Pitch* (03.152) and *P2 Linear Line Pitch* (03.153) should be used to set up the position feedback interface.

Parameter	03.152 P2 Linear Comms Pitch		
Short description	Defines the distance covered by the least significant bit of the position information in a comms message from a linear encoder		
Mode	Open-Loop		
Minimum	0.001	Maximum	100.000
Default	0.001	Units	
Type	32 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	3
Coding	RW		

P2 Device type (03.138): EnDat, SSI, BiSS

P2 Linear Comms Pitch (03.152) is used to define the distance covered by the least significant bit of the position information in a comms message from a linear encoder. The units used by this parameter are defined by *P2 Linear Comms And Line Pitch Units* (03.154).

P2 Device type (03.138): Any other device

P2 Linear Comms Pitch (03.152) has no effect.

Parameter	03.153 P2 Linear Line Pitch		
Short description	Defines the linear line pitch for device P2		
Mode	Open-Loop		
Minimum	0.001	Maximum	100.000
Default	0.001	Units	
Type	32 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	3
Coding	RW		

P2 Linear Line Pitch (03.153) only has any effect if the position feedback interface is being used with a linear device (i.e. *P2 Linear Feedback Select* (03.151) = 1) and should be used to define the distances listed below for each type of device. The units used by this parameter are defined by *P2 Linear Comms And Line Pitch Units* (03.154).

P2 Device type (03.138): AB

P2 Linear Line Pitch (03.153) should be set to the distance covered by one line period on the encoder.

P2 Device type (03.138): FD, FR

P2 Linear Line Pitch (03.153) should be set to the distance covered by two line periods on the encoder.

P2 Device type (03.138): Any other device

P2 Linear Line Pitch (03.153) has no effect.

Parameter	03.154 P2 Linear Comms And Line Pitch Units		
Short description	Defines the linear units in either millimetres or micrometres		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	millimetres
1	micrometres

P2 Linear Comms And Line Pitch Units (03.154) defines the units used by *P2 Linear Comms Pitch* (03.152) and *P2 Linear Line Pitch* (03.153) in millimetres or micrometres.

Parameter	03.155 P2 Pole Pair Pitch		
Short description	Defines the change of position for one electrical revolution of the drive output with a linear position device.		
Mode	Open-Loop		
Minimum	0.01	Maximum	1000.00
Default	10.00	Units	mm
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

P2 Pole Pair Pitch (03.155) gives the distance equivalent to one electrical revolution when linear position feedback is used. See *P1 Pole Pair Pitch* (03.055) for more detail.

Parameter	03.156 P2 Feedback Reverse		
Short description	Set to 1 to reverse the direction of the position feedback		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *P2 Feedback Reverse* (03.156) = 1 the position feedback is negated. This can be used to reverse the direction of the position feedback.

Parameter	03.157 P2 Normalisation Turns		
Short description	Defines the number of turns bits included in the normalisation parameters		
Mode	Open-Loop		
Minimum	0	Maximum	16
Default	16	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Normalisation Turns (03.157) defines the number of turns bits included in the following parameters. See *P1 Normalisation Turns* (03.057) for more information.

P2 Normalised Position (03.158)

P2 Normalised Marker Position (03.159)

F1 Normalised Freeze Position (03.103) if P2 is the source position for freeze function F1

F2 Normalised Freeze Position (03.108) if P2 is the source position for freeze function F2

Parameter	03.158 P2 Normalised Position		
Short description	Displays the position taken from the position feedback device including the effect of the marker function		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P2 Normalised Position (03.158) is the position taken from the position feedback device including the effect of the marker function. See *P2 Normalisation Turns* (03.157) for details of the format.

Parameter	03.159 P2 Normalised Marker Position		
Short description	Displays the normalised position at the last marker event		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P2 Normalised Marker Position (03.159) is the value *P2 Normalised Position* (03.158) at the last marker event provided bit 2 of *P2 Marker Mode* (03.131) is set to 1. See *P2 Marker Mode* (03.131) for more details.

Parameter	03.160 P2 Calculation Time		
Short description	Defines the time from the first edge of the clock signal from the position feedback interface until the encoder has calculated the position and is ready to return this information		
Mode	Open-Loop		
Minimum	0	Maximum	20
Default	5	Units	µs
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Device type (03.138): EnDat

P2 Calculation Time (03.160) is the time from the first edge of the clock signal from the position feedback interface until the encoder has calculated the position and is ready to return this information. This is used to calculate the overall time for a message interchange with the encoder. See *P2 Low Speed Update Rate Active* (03.163) for more details.

P2 Device type (03.138): Any other type of device

P2 Calculation Time (03.160) has no effect.

Parameter	03.161 P2 Recovery Time		
Short description	Defines the time that must be allowed after each message interchange before a new message begins		
Mode	Open-Loop		
Minimum	4	Maximum	100
Default	30	Units	µs
Type	8 Bit User Save	Update Rate	Background read, auto-configuration write
Display Format	Standard	Decimal Places	0
Coding	RW		

P2 Device type (03.138): EnDat, SSI, BiSS

P2 Recovery Time (03.161) is the time that must be allowed after each message interchange before a new message begins.

P2 Device type (03.138): Any other type of device

P2 Recovery Time (03.161) has no effect.

Parameter	03.162 P2 Line Delay Time		
Short description	Displays the transmission delay between the position feedback interface and the encoder and back again		
Mode	Open-Loop		
Minimum	0	Maximum	5000
Default		Units	ns
Type	16 Bit User Save	Update Rate	Background read, position feedback initialisation write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P2 Device type (03.138): EnDat, SSI, BiSS

During position feedback initialisation the transmission delay between the position feedback interface and the encoder and back again is measured and stored in *P2 Line Delay Time* (03.162). This value is then used to compensate for this delay so that the clock/data skew does not prevent the data from the encoder from being read. This means that longer line lengths can be used with these feedback devices provided the correct cable and connection arrangements are used.

P2 Device type (03.138): Any other type of device

P2 Line Delay Time (03.162) is always zero.

Parameter	03.163 P2 Low Speed Update Rate Active		
Short description	Indicates when the low speed update rate is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P2 Device type (03.138): EnDat, SSI, BiSS

If the position can be sampled in 60µs *P2 Low Speed Update Rate Active* (03.163) = 0, otherwise *P2 Low Speed Update Rate Active* (03.163) = 1.

The following parameters are used by the drive to determine the necessary time to obtain the required data from the position feedback device.

P2 Rotary Turns Bits (03.133)
P2 Comms Bits (03.135)
P2 Comms Baud Rate (03.137)
P2 Calculation Time (03.160)
P2 Recovery Time (03.161)
P2 Line Delay Time (03.162)
P2 User Comms Enable (03.167)

See *P1 Low Speed Update Rate Active* (03.063) for more information on how this time is calculated.

P2 Device type (03.138): Any other type of device

P2 Low Speed Update Rate Active (03.163) is always zero.

Parameter	03.164 P2 Encoder Protocol Detected		
Short description	Defines which protocol is used with the device P2		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Hiperface
2	EnDat2.1
3	EnDat2.2
4	BiSS

P2 Encoder Protocol Detected (03.164) shows the encoder comms protocol detected during position feedback initialisation. If *P2 Device type* (03.138) is set to BiSS then *P2 Encoder Protocol Detected* (03.164) is set to the appropriate value after successful communication with the encoder during initialisation. If *P2 Device type* (03.138) is set to EnDat then *P2 Encoder Protocol Detected* (03.164) is set to the appropriate EnDat protocol after successful communication with the encoder during initialisation. If communications is not successful during initialisation then *P2 Encoder Protocol Detected* (03.164) is set to 0 (None).

Parameter	03.167 P2 User Comms Enable		
Short description	Enables the use of the user comms parameters to communicate to the encoder connected to P2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *P2 User Comms Enable* (03.167) set to a non-zero value it is possible to use *P2 User Comms Transmit Register* (03.168) and *P2 User Comms Receive Register* (03.169) to communicate with an encoder that has a Hiperface, EnDat 2.1, EnDat2.2 or BiSS interface. See *P1 User Comms Enable* (03.067) for a description of how to use these registers.

Parameter	03.168 P2 User Comms Transmit Register		
Short description	Defines the value present in the user comms transmit register		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RW, NC, PT, BU		

See *P2 User Comms Enable* (03.167).

Parameter	03.169 P2 User Comms Receive Register		
Short description	Defines the value present in the user comms receive register		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RW, NC, PT, BU		

See *P2 User Comms Enable* (03.167).

Parameter	03.171 P2 Error Detected		
Short description	Indicates if an error has been detected with the position feedback device connected to the P1 position interface		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

P2 Error Detected (03.171) is set if an error has been detected with the position feedback device connected to the P2 position interface. This parameter is useful if encoder trips have been disabled with *P2 Error Detection Level* (03.140).

Parameter	03.172 P2 Status		
Short description	Displays the status of the P2 position interface		
Mode	Open-Loop		
Minimum	0	Maximum	9
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT

9	BiSS Alt

Priority of the 15-way D-type is assigned in the following order from the highest priority to the lowest.

1. P1 position interface
2. Encoder simulation output
3. P2 position interface

The availability of the P2 position interface on the 15-way D-type on the drive is dependent on type of feedback device selected in *P1 Device Type* (03.038) and the encoder simulation mode selected in *Encoder Simulation Mode* (03.088). *P2 Status* (03.172) shows the status of the P2 position interface depending on the settings in *P2 Device type* (03.138), *P1 Device Type* (03.038), and *Encoder Simulation Mode* (03.088).

0: None

The P2 position interface is not available.

1: AB

2: FD

3: FR

4: EnDat

5: SSI

6: BiSS

The P2 position interface is available. The connections for the P2 position interface are shown below.

P2 Status (03.172)	15-way D-type connections					
	1/2	3/4	5/6	7/8	9/10	11/12
AB				A2	B2	Z2
FD				F2	D2	Z2
FR				F2	R2	Z2
EnDat				D2	Clk2	Z2
SSI				D2	Clk2	Z2
BiSS				D2	Clk2	Z2

7: EnDat Alt

8: SSI Alt

9: BiSS Alt

The P2 position interface is available but uses alternative connections as shown below as connection 7/8 and 9/10 are used by the encoder simulation output.

P2 Status (03.172)	15-way D-type connections					
	1/2	3/4	5/6	7/8	9/10	11/12
EnDat Alt			D2	AOut	BOut	Clk2
SSI Alt			D2	AOut	BOut	Clk2
BiSS Alt			D2	AOut	BOut	Clk2

See the introduction to this menu for more information on the position feedback interfaces.

Parameter	03.173 P2 Absolute Turns Recovery Enable		
Short description	Set to 1 to allow turns information beyond the number of turns bits provided by the position feedback device connected to P2 to be stored on power-down and recovered at next power-up		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW		

See P1 Absolute Turns Recovery Enable (03.073).

Parameter	03.174 P2 Additional Configuration		
Short description	Provides additional configuration information for the position feedback device not included in the other set-up parameters.		
Mode	Open-Loop		
Minimum	0	Maximum	511116116
Default	0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See P1 Additional Configuration (03.074).

Menu 4 – Torque and Current control

Mode: Open-Loop

In Open-loop mode it is possible to control the motor speed or the motor torque. When the speed of the motor is controlled (*Torque Mode Selector* (04.011) = 0) the *Post Ramp Reference* (02.001) is defined by the ramp system unless the current limits are active. The *Post Ramp Reference* (02.001) can directly define the output frequency of the drive or this can be modified to compensate for motor slip. If the current limits are active (*Current Limit Active* (10.009) = 1) the ramp system remains active, but the output of the current controller is added to the ramp output so that the frequency applied to the motor is modified to try and reduce the torque producing current in the motor. For example, if the *Post Ramp Reference* (02.001) is positive (i.e. motor is running forwards) and the motor is overloaded with a motoring load a positive *Iq*, *Torque Producing Current* (04.002) is generated that will exceed the *Final Current Limit* (04.018). This gives a negative error which attempts to reduce the ramp output causing the motor to slow down.

When motor torque is being controlled (*Torque Mode Selector* (04.011) = 1) the *Final Torque Reference* (04.003) is converted to a current reference and the current limits are applied giving the *Final Current Reference* (04.004). This is used as the reference input to the PI controller that regulates the torque producing current in the motor. The output of the PI controller is the *Post Ramp Reference* (02.001), and so the torque is controlled by increasing or decreasing the motor frequency. This system gives only moderate dynamic performance. For better torque control in a system without position feedback RFC-A mode should be used.

Throughout this section *Rated Current* (05.007) and other parameters related to motor 1 are used. It should be noted that this applies if *Select Motor 2 Parameters* (11.045) = 0. If *Select Motor 2 Parameters* (11.045) = 1 then *M2 Rated Current* (21.007) and other parameter associated with motor 2 should be used instead.

The full scale current is the maximum current that the drive can measure and if the current exceeds this level the drive may produce an over current trip. K_c is the current scaling for the drive and is used in determining the control performance of the drive. This is given in *Full Scale Current K_c* (11.061) and K_c is equal the full scale current in r.m.s. Amps. (Note that this is a change from Unidrive SP which used the full scale current multiplied by 0.45 for K_c .) The current is limited by the peak limit system to a maximum level of $0.8 \times K_c$. The peak limit controls the total current, however the control system current limit only applies to the torque producing current and would limit the maximum current to I_{MaxRef} if the magnetising current remains constant at its rated level. I_{MaxRef} must give headroom below the peak limit and is set at $0.7 \times K_c$, provided *Rated Current* (05.007) is set to the

Maximum Heavy Duty Rating (11.032) or less. If *Rated Current* (05.007) is set to a higher level then the current limits can be adjusted so that the maximum current reference vector (I_{MaxRef}) is equal to $1.1 \times \text{Maximum Rated Current}$ (11.060) or $0.7 \times K_c$ whichever is lower.

The drive can have a heavy duty rating intended for applications where high overload current may be required under transient conditions, or it can have a normal duty rating where a lower level of overload current is required. The duty rating is selected automatically by the drive based on the setting of *Rated Current* (05.007). The *Maximum Heavy Duty Rating* (11.032) and *Maximum Rated Current* (11.060) are fixed for each drive size and the table below shows the possible duty ratings that can be selected depending on the levels of these parameters.

Conditions	Possible duty ratings
<i>Maximum Heavy Duty Rating</i> (11.032) = 0.00	Normal duty operation only
<i>Maximum Heavy Duty Rating</i> (11.032) < <i>Maximum Rated Current</i> (11.060)	Heavy duty operation if rated current > MAX, otherwise normal duty operation
<i>Maximum Heavy Duty Rating</i> (11.032) = <i>Maximum Rated Current</i> (11.060)	Heavy duty operation only

The different duty ratings modify the motor protection characteristic (see *Motor Thermal Time Constant 1* (04.015)). The different duty ratings can also change the level of I_{MaxRef} as described previously.

In a drive that contains multiple power modules *Full Scale Current K_c* (11.061) is the full scale current of an individual module multiplied by the number of modules. *Maximum Heavy Duty Rating* (11.032) and *Maximum Rated Current* (11.060) are the value for an individual module multiplied by the number of modules.

Variable Maximums applied to the current limits

The variable maximums applied to the current limit parameters are VM_MOTOR1_CURRENT_LIMIT for motor map 1 and VM_MOTOR2_CURRENT_LIMIT for motor map 2. The calculations given below are used in each drive mode to define VM_MOTOR1_CURRENT_LIMIT. Similar calculations based on the equivalent motor map 2 parameters are used to define VM_MOTOR2_CURRENT_LIMIT.

The diagram shows a motor operating with a current equal to I_{MaxRef} , which was defined in the previous section. The magnetising and torque producing motor currents are defined for rated conditions as follows.

$$I_{Rated} = \text{Rated Current (05.007)}$$

$$\cos \phi = \text{Rated Power Factor (05.010)}$$

The angle between the total current vector and the torque producing current ($\cos \phi$) is assumed to be equivalent to the power factor. The power factor is really the angle between the voltage and current vectors. Normally for Open-loop operation the difference between the power factor and $\cos \phi$ is small and can be neglected. Therefore

$$\text{Rated magnetising current } I_{Mrated} = I_{Rated} \sin \phi$$

$$\text{Rated torque producing current } I_{Trated} = I_{Rated} \cos \phi$$

Assuming that the magnetising current does not change with load then when the motor operates with maximum allowed current (I_{MaxRef}) the torque producing current is given by:

$$I_{Tlimit} = I_{MaxRef} \times \cos(\sin^{-1}(I_{Mrated} / I_{MaxRef}))$$

The maximum required current limit setting is given by:

$$VM_MOTOR1_CURRENT_LIMIT = (I_{Tlimit} / I_{Trated}) \times 100\%$$

As mentioned previously the magnetising current does vary slightly with load, but the headroom between I_{MaxRef} and the peak limit should allow for this.

Parameter	04.001 Current Magnitude		
Short description	Shows the instantaneous drive output current		
Mode	Open-Loop		
Minimum	-VM_DRIVE_CURRENT_UNIPOLAR	Maximum	VM_DRIVE_CURRENT_UNIPOLAR
Default		Units	A
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	3
Coding	RO, FI, VM, ND, NC, PT		

Current Magnitude (04.001) is the instantaneous drive output current scaled so that it represents the r.m.s. phase current in Amps under steady state conditions.

Parameter	04.002 Torque Producing Current		
Short description	Shows the instantaneous level of torque producing current		
Mode	Open-Loop		
Minimum	-VM_DRIVE_CURRENT	Maximum	VM_DRIVE_CURRENT
Default		Units	A
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	3
Coding	RO, FI, VM, ND, NC, PT		

I_q , Torque Producing Current (04.002) is the instantaneous level of torque producing current scaled so that it represents the r.m.s. level of current under steady state conditions. I_q , Torque Producing Current (04.002) is proportional to the torque produced by the motor provided field weakening is not active. For field weakening operation the I_q , Torque Producing Current (04.002) is boosted for a given level of torque to compensate for the reduction in the motor flux.

Sign of I_q , Torque Producing Current (04.002)	Sign of frequency or speed	Direction of motor torque
+	+	Accelerating
-	+	Decelerating
+	-	Decelerating
-	-	Accelerating

Parameter	04.003 Final Torque Reference		
Short description	Shows the final torque reference		
Mode	Open-Loop		
Minimum	-VM_TORQUE_CURRENT	Maximum	VM_TORQUE_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

The Final Torque Reference (04.003) is the sum of the Torque Reference (04.008), and Torque Offset (04.009) if enabled, as a percentage of rated motor torque.

Parameter	04.004 Final Current Reference		
Short description	Shows the final current reference after the current limits		
Mode	Open-Loop		
Minimum	-VM_TORQUE_CURRENT	Maximum	VM_TORQUE_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

The Final Torque Reference (04.003) is converted into the Final Current Reference (04.004) by applying a torque to current conversion and by applying the Final Current Limit (04.018). The torque to current conversion is applied as follows:

$|Output\ Frequency\ (05.001)| \leq Rated\ Frequency\ (05.006)$
Current reference = Final Torque Reference (04.003)

$|Output\ Frequency\ (05.001)| > Rated\ Frequency\ (05.006)$
Current reference = Final Torque Reference (04.003) x Rated Frequency (05.006) / Output Frequency (05.001)

Parameter	04.005 Motoring Current Limit		
Short description	Defines the current limit used when the motor is being accelerated away from standstill		
Mode	Open-Loop		
Minimum	-VM_MOTOR1_CURRENT_LIMIT	Maximum	VM_MOTOR1_CURRENT_LIMIT
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

The Motoring Current Limit (04.005) limits the current when the motor is being accelerated away from standstill. The Regenerating Current Limit (04.006) limits the current when the motor is being decelerated towards standstill. If the Symmetrical Current Limit (04.007) is below the Motoring Current Limit (04.005) then it is used instead of the Motoring Current Limit (04.005). If the Symmetrical Current Limit (04.007) is below the Regenerating Current Limit (04.006) then it is used instead of the Regenerating Current Limit (04.006).

The maximum possible current limit (VM_MOTOR1_CURRENT_LIMIT [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.

Parameter	04.006 Regenerating Current Limit		
Short description	Defines the current limit used when the motor is being decelerated towards standstill		
Mode	Open-Loop		
Minimum	-VM_MOTOR1_CURRENT_LIMIT	Maximum	VM_MOTOR1_CURRENT_LIMIT
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

See *Motoring Current Limit* (04.005).

Parameter	04.007 Symmetrical Current Limit		
Short description	Defines the symmetrical current limit		
Mode	Open-Loop		
Minimum	-VM_MOTOR1_CURRENT_LIMIT	Maximum	VM_MOTOR1_CURRENT_LIMIT
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

See *Motoring Current Limit* (04.005).

Parameter	04.008 Torque Reference		
Short description	Defines the torque reference		
Mode	Open-Loop		
Minimum	-VM_USER_CURRENT_HIGH_RES	Maximum	VM_USER_CURRENT_HIGH_RES
Default	0.00	Units	%
Type	32 Bit User Save	Update Rate	250µs read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

Gives the required torque reference as a percentage of rated motor torque.

Parameter	04.009 Torque Offset		
Short description	Defines the torque offset to be added to the torque reference		
Mode	Open-Loop		
Minimum	-VM_USER_CURRENT	Maximum	VM_USER_CURRENT
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

The torque offset added to *Torque Reference* (04.008) if *Torque Offset Select* (04.010) = 1.

Parameter	04.010 Torque Offset Select		
Short description	Set to add the torque offset to the torque reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Torque Reference* (04.008).

Parameter	04.011 Torque Mode Selector		
Short description	Defines the torque mode used by the drive		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Torque Mode Selector* (04.011) = 0 the ramp system defines the *Post Ramp Reference* (02.001) unless the current limits are active, and so the motor is speed controlled. If *Torque Mode Selector* (04.011) = 1 the torque controller defines the *Post Ramp Reference* (02.001) and so the motor is torque controlled.

Parameter	04.013 Current Controller Kp Gain		
Short description	Defines the current loop controller proportional gain		
Mode	Open-Loop		
Minimum	0	Maximum	30000
Default	20	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Current Controller Kp Gain (04.013) and *Current Controller Ki Gain* (04.014) are the proportional and integral gains of the current controller. As already mentioned the current controller either provides current limits or closed-loop torque control by modifying the *Post Ramp Reference* (02.001). The control loop is also used in its torque mode during supply loss, or when the controlled mode standard ramp is active and the drive is decelerating, to regulate the flow of current into the drive. Although the default settings have been chosen to give suitable gains for less demanding applications it may be necessary for the user to adjust the performance of the controller. The following is a guide to setting the gains for different applications.

Current limit operation

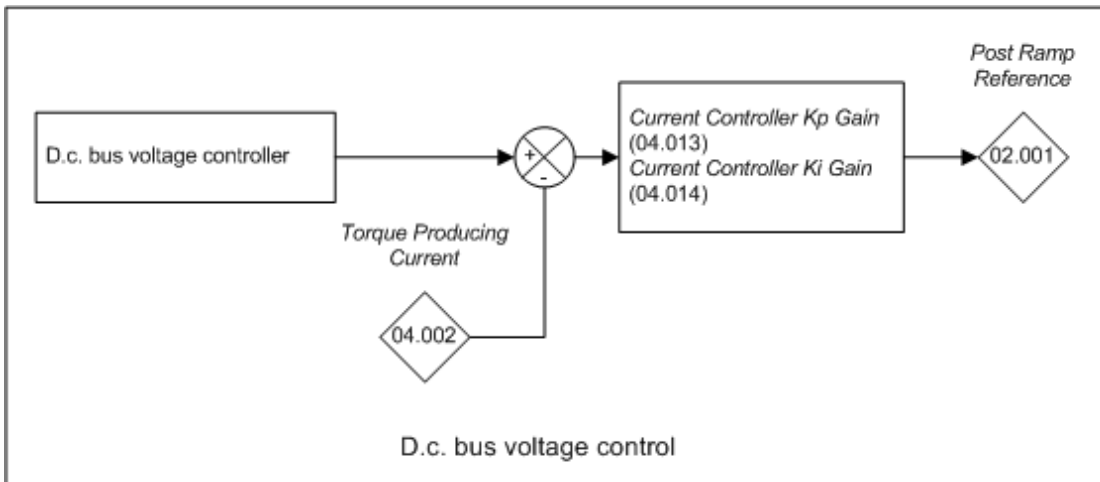

The current limits will normally operate with an integral term only, particularly below the point where field weakening begins. The proportional term is inherent in the loop. The integral term must be increased enough to counter the effect of the ramp which is still active even in current limit. For example, if the drive is operating at constant frequency and is overloaded the current limit system will try to reduce the output frequency to reduce the load. At the same time the ramp will try to increase the frequency back up to the demand level. If the integral gain is increased too far the first signs of instability will occur when operating around the point where field weakening begins. These oscillations can be reduced by increasing the proportional gain. A system has been included to prevent regulation because of the opposite actions of the ramps and the current limit. This can reduce the actual level that the current limit becomes active by 12.5%. This still allows the current to increase up to the current limit set by the user. However the *Current Limit Active* (10.009) flag could become active up to 12.5% below the current limit depending on the ramp rate used.

Torque control

Again the controller will normally operate with an integral term only, particularly below the point where field weakening begins. The first signs of instability will appear around base speed, and can be reduced by increasing the proportional gain. The controller can be less stable in torque control mode compared to when it is used for current limiting. This is because load helps to stabilise the controller, and under torque control the drive may operate with light load. Under current limit the drive is often under heavy load unless the current limits are set at a low level.

Supply loss and standard ramp

The d.c. bus voltage controller becomes active if supply loss detection is enabled and the drive supply is lost or standard ramp is being used (*Ramp Mode* (02.004) > 0) and the motor is regenerating. The d.c. bus controller attempts to hold the d.c. bus voltage at a fixed level by controlling the flow of current from the drive inverter into its d.c. bus capacitors. The system is forced into current control mode and the output of the d.c. bus voltage controller is fed into the current controller as shown below.

Although it is not usually necessary, the d.c. bus voltage controller gain can be adjusted with the *Voltage Controller Gain* (05.031). However, it may be necessary to adjust the current controller gains to obtain the required performance. If the gains are not suitable it is best to set up the drive in torque control first. Set the gains to a value that does not cause instability around the point at which field weakening occurs. Then revert back to open loop speed control in standard ramp mode. To test the controller, the supply should be removed whilst the motor is running. It is likely that the gains can be increased further if required because the d.c. bus voltage controller has a stabilising effect, provided that the drive is not required to operate in torque control mode.

Parameter	04.014 Current Controller Ki Gain		
Short description	Defines the current loop controller integral gain		
Mode	Open-Loop		
Minimum	0	Maximum	30000
Default	40	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Current Controller Kp Gain* (04.013).

Parameter	04.015 Motor Thermal Time Constant 1		
Short description	Set to the thermal time constant for the motor		
Mode	Open-Loop		
Minimum	1.0	Maximum	3000.0
Default	89.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

A dual time constant thermal model is provided that can be used to estimate the motor temperature as a percentage of its maximum allowed temperature. The input to the model is the *Current Magnitude* (04.001). Throughout the following discussion *Rated Current* (05.007) is used in the model assuming *Select Motor 2 Parameters* (11.045) = 0. If *Select Motor 2 Parameters* (11.045) = 1 then *M2 Rated Current* (21.007) is used instead. It should be noted that if the parameters that have been added in addition to those in Unidrive SP are left at their default values the model is a simple single time constant model as provided in Unidrive SP.

Percentage Losses

The losses in the motor are calculated as a percentage value.

$$\text{Percentage Losses} = 100\% \times [\text{Load Related Losses} + \text{Iron Losses}]$$

where:

$$\text{Load Related Losses} = (1 - K_{fe}) \times (I / (K_1 \times I_{\text{Rated}}))^2$$

$$\text{Iron Losses} = K_{fe} \times (w / w_{\text{Rated}})^{1.6}$$

where:

$$I = \text{Current Magnitude (04.001)}$$

$$I_{\text{Rated}} = \text{Rated Current (05.007)}$$

$$K_{fe} = \text{Rated Iron Losses As Percentage Of Losses (04.039)} / 100\%$$

The iron losses are relatively low in motors that have a rated frequency of 60Hz or less, and so the motor could be modelled based on load related losses alone. This can be done by setting K_{fe} to zero. In motors where iron losses are significant, K_{fe} defines the proportion of losses that are iron losses under rated conditions (i.e. rated current and rated frequency). For example if the iron losses are 30% of losses and other losses are 70% of losses under rated conditions *Rated Iron Losses As Percentage Of Losses* (04.039) should be set to 30%.

The value of K_1 defines the continuous allowable motor overload as a proportion of the *Rated Current* (05.007) before the *Motor Protection Accumulator* (04.019) reaches 100%. The value of K_1 can be used to model reduced cooling at low speeds and to allow the motor to operate under rated conditions with a small margin to prevent spurious trips. K_1 is defined in more detail later.

Motor Protection Accumulator

So far the steady state motor losses have been defined, but the motor model must estimate the temperature within the motor under dynamically changing conditions, and so the *Motor Protection Accumulator* (04.019) is given by the following equation.

$$T = \text{Percentage Losses} \times [(1 - K_2) (1 - e^{-t/\tau_1}) + K_2 (1 - e^{-t/\tau_2})]$$

where

$$T = \text{Motor Protection Accumulator (04.019)}$$

$$K_2 = \text{Motor Thermal Time Constant 2 Scaling (04.038)} / 100\%$$

$$\tau_1 = \text{Motor Thermal Time Constant 1 (04.015)}$$

$$\tau_2 = \text{Motor Thermal Time Constant 2 (04.037)}$$

$[(1 - K_2) (1 - e^{-t/\tau_1}) + K_2 (1 - e^{-t/\tau_2})]$ gives the effects of the thermal time constants in the motor. K_2 defines the ratio of the contribution to the *Motor Protection Accumulator* (04.019) value from each of the time constants. If K_2 is set to its default value of 0 then

only *Motor Thermal Time Constant 1* (04.015) is included and the model will give the temperature of the main mass of the motor body. To give better protection to the motor, the model can be used to model a particular point in the motor, for example the stator windings. This can be done by including an additional shorter time constant representing the thermal impedance between the windings and the main mass of the motor body which can be modelled with *Motor Thermal Time Constant 2* (04.037).

Reduced cooling with lower speed

If *Rated Current* (05.007) \leq *Maximum Heavy Duty Rating* (11.032) then K_1 is defined as shown below. If *Low Speed Thermal Protection Mode* (04.025) = 0 the characteristic is intended for a motor which can operate at rated current over the whole speed range. Induction motors with this type of characteristic normally have forced cooling. If *Low Speed Thermal Protection Mode* (04.025) = 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor speed below half of rated speed. The maximum value for K_1 is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105% of rated current.

If Rated Current (05.007) > Maximum Heavy Duty Rating (11.032) then K_1 is defined as shown below. Two different characteristics are provided, but in both cases the motor performance is limited at lower speeds and the permissible overload is reduced from 105% to 101%.

Time for Motor Protection Accumulator to reach 100%

Assuming a single time constant model is being used (i.e. Motor Thermal Time Constant 2 Scaling (04.038)), the time for the Motor Protection Accumulator (04.019) to change from its initial value to 100% is given by the following equation:

$$\text{Time to reach 100.0\%} = -\tau_1 \times \ln[(1 - C_1) / (C_0 - C_1)]$$

C_0 represents the conditions that have persisted for long enough for the Motor Protection Accumulator (04.019) to reach a steady state value. If the motor current and speed are I_0 and w_0 then,

$$C_0 = [(1 - K_{fe}) \times (I_0 / (K_1 \times I_{Rated}))^2] + [K_{fe} \times (w_0 / w_{Rated})^{1.6}]$$

C_1 represents the conditions that begin at the start of the time being calculated. If the motor current and speed are by I_1 and w_1 then,

$$C_1 = [(1 - K_{fe}) \times (I_1 / (K_1 \times I_{Rated}))^2] + [K_{fe} \times (w_1 / w_{Rated})^{1.6}]$$

Example 1: The effect of iron losses are not modelled ($K_{fe} = 0$), *Motor Thermal Time Constant 1* (04.015) = 89s, the initial current is zero, *Rated Current* (05.007) \leq *Maximum Heavy Duty Rating* (11.032) and the new level of current is 1.5 x *Rated Current* (05.007).

$$C_0 = 0$$

$$C_1 = [1.5 / (1.05 \times 1.0)]^2 = 2.041$$

$$\text{Time to reach 100.0\%} = -89 \times \ln(1 - 1/C_1) = -89 \times \ln(1 - 1/2.041) = 60\text{s}$$

This is the default setting for Open-loop and RFC-A modes allowing an induction motor to run at 150% rated current for 60s from cold.

Example 2: The effect of iron losses are not modelled ($K_{fe} = 0$), *Motor Thermal Time Constant 1* (04.015) = 89s, the initial current is *Rated Current* (05.007), *Rated Current* (05.007) \leq *Maximum Heavy Duty Rating* (11.032) and the new level of current is 1.5 x *Rated Current* (05.007).

$$C_0 = [1.0 / (1.05 \times 1.0)]^2 = 0.907$$

$$C_1 = [1.5 / (1.05 \times 1.0)]^2 = 2.041$$

$$\text{Time to reach 100.0\%} = -89 \times \ln((1 - C_1) / (C_0 - C_1)) = -89 \times \ln((1 - 2.041) / (0.907 - 2.041)) = 7.6\text{s}$$

This is the default setting for Open-loop and RFC-A modes allowing an induction motor to run at 150% rated current for 7.6s after running under rated conditions for a significant period of time.

Motor Protection Accumulator Reset

The initial value in the *Motor Protection Accumulator* (04.019) at power-up is defined by *Motor Protection Accumulator Power-up Value* (04.036) as given in the table below.

Motor Protection Accumulator Power-up Value (04.036)	Motor Protection Accumulator (04.019) at power-up
Power Down	The value is saved at power-down and is used as the initial value at power-up.
Zero	The value is set to zero
Real Time	If a real-time clock is present and if <i>Date/Time Selector</i> (06.019) is set up to select the real-time clock then the value saved at power-down is modified to include the effect of the motor thermal protection time constants over the time between power-down and power-up. This modified value is then used as the initial value at power-up. If no real time clock is present then and this option is selected then the value saved at power-down is used as the initial value.

The *Motor Protection Accumulator* (04.019) is reset under the following conditions:

1. *Motor Thermal Time Constant 1* (04.015) is set to 0.0. Note that this is not possible in the standard product as the minimum parameter value is 1.0.
2. *Select Motor 2 Parameters* (11.045) is modified.
3. *Rated Current* (05.007) is modified when *Select Motor 2 Parameters* (11.045) = 0, or *M2 Rated Current* (21.007) is modified when *Select Motor 2 Parameters* (11.045) = 1.
4. *Thermal Protection Mode* (04.016) is modified.

Motor Protection Accumulator Warning

If Percentage Losses > 100% then eventually the *Motor Protection Accumulator* (04.019) will reach 100% causing the drive to trip or the current limits to be reduced. If this is the case and *Motor Protection Accumulator* (04.019) > 75.0% then [Motor Overload] alarm indication is given and *Motor Overload Alarm* (10.017) is set to one.

Parameter	04.016 Thermal Protection Mode		
Short description	Set to the require thermal protection mode		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

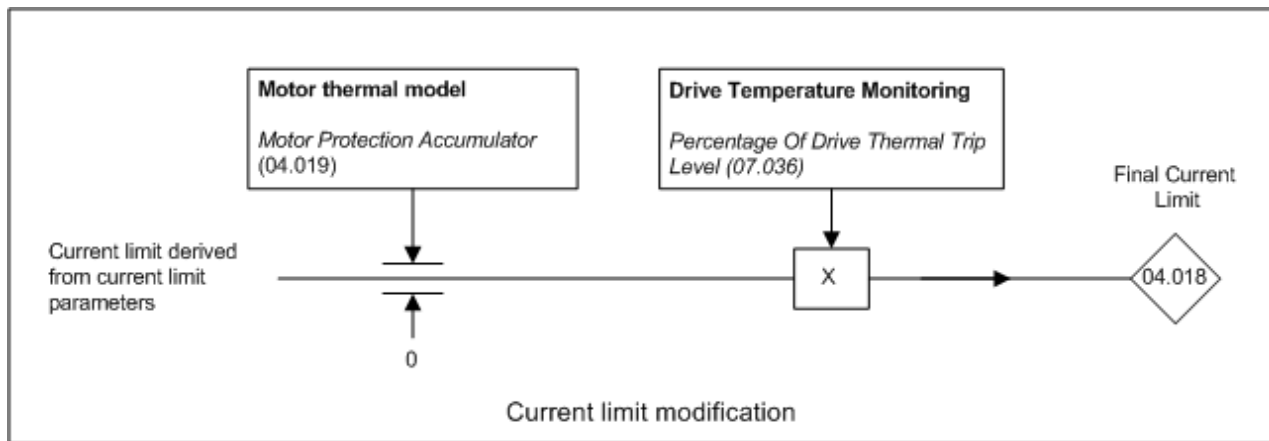

Value	Text
0	Motor Trip
1	Motor Limit
2	Drive Limit
3	Both Limit
4	Disabled

Thermal Protection Mode (04.016) defines the action taken by the drive when *Motor Protection Accumulator* (04.019) reaches 100%

and/or *Percentage Of Drive Thermal Trip Level* (07.036) exceeds 90%. The actions for each mode are given in the table below.

Thermal Protection Mode (04.016)	Actions
Motor Trip (0)	<i>Motor Too Hot</i> trip is initiated when <i>Motor Protection Accumulator</i> (04.019) reaches 100%. No current limiting. <i>Motor Protection Accumulator</i> (04.019) is limited to 100.0%.
Motor Current Limit (1)	<i>Motor Too Hot</i> trip is disabled. Current limiting on motor overload as described below. <i>Motor Protection Accumulator</i> (04.019) is limited to 100.0%.
Drive Current Limit (2)	<i>Motor Too Hot</i> trip is initiated when <i>Motor Protection Accumulator</i> (04.019) reaches 100%. Current limiting on drive thermal monitoring as described below. <i>Motor Protection Accumulator</i> (04.019) is limited to 100.0%.
Motor and Drive Current Limit (3)	<i>Motor Too Hot</i> trip is disabled. Current limiting on motor overload and drive thermal monitoring as described below. <i>Motor Protection Accumulator</i> (04.019) is limited to 100.0%.
Disabled (4)	<i>Motor Too Hot</i> trip is disabled and <i>Motor Overload</i> alarm is disabled. No current limiting. <i>Motor Protection Accumulator</i> (04.019) is limited to 200.0%.

The current limit is derived from the current limit parameters (i.e. *Motoring Current Limit* (04.005), etc.) depending on the set-up and conditions. The current limit can be further limited by current limit on motor overload and/or drive temperature monitoring as shown below to give the *Final Current Limit* (04.018).

Current limiting on motor overload

When the *Motor Protection Accumulator* (04.019) reaches 100.0% the current limit is limited to $(K_1 - 0.05) \times 100.0\%$. This limitation is removed when the *Motor Protection Accumulator* (04.019) falls below 95.0%. (K_1 is defined in the description of *Motor Thermal Time Constant 1* (04.015).)

Drive thermal monitoring current limiting

If *Percentage Of Drive Thermal Trip Level* (07.036) exceeds 90% the current limit is modified as follows:

$$\text{Final Current Limit (04.018)} = \text{Current limit} \times (100\% - \text{Percentage Of Drive Thermal Trip Level (07.036)}) / 10\%$$

If both of the above attempt to reduce the final current limit the lowest calculated value of current limit is used.

This system has the effect of reducing the current limit to zero at the point where the drive should be tripped because its thermal monitoring has reached a trip threshold. This is intended to limit the load on the drive to prevent it from tripping when supplying a load that increases with speed and does not include rapid transients.

Parameter	04.017 Magnetising Current		
Short description	Shows the instantaneous level of magnetising current		
Mode	Open-Loop		
Minimum	-VM_DRIVE_CURRENT	Maximum	VM_DRIVE_CURRENT
Default		Units	A
Type	32 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	3
Coding	RO, FI, VM, ND, NC, PT		

I_d, *Magnetising Current* (04.017) is the instantaneous level of magnetising current scaled so that it represents the r.m.s. level of magnetising current under steady state conditions.

Parameter	04.018 Final Current Limit		
Short description	Shows the final current limit that is applied to the torque producing current		
Mode	Open-Loop		
Minimum	-VM_TORQUE_CURRENT	Maximum	VM_TORQUE_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, VM, ND, NC, PT		

Final Current Limit (04.018) is the current limit level that is applied to give the *Final Current Reference* (04.004).

Parameter	04.019 Motor Protection Accumulator		
Short description	Shows the level of the motor protection accumulator		
Mode	Open-Loop		
Minimum	0.0	Maximum	200.0
Default		Units	%
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

See *Motor Thermal Time Constant 1* (04.015).

Parameter	04.020 Percentage Load		
Short description	Shows the level of torque producing current as a percentage of rated torque producing current for the motor		
Mode	Open-Loop		
Minimum	-VM_USER_CURRENT	Maximum	VM_USER_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

Percentage Load (04.020) gives the *I_q, Torque Producing Current* (04.002) as a percentage of the rated torque producing current for the motor. Positive values indicate motoring and negative values represent regenerating.

Parameter	04.021 Current Feedback Filter Disable		
Short description	Disables the 4ms filter applied to current feedback parameters		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Current Feedback Filter Disable* (04.021) = 0 a 4ms filter is applied to the current feedback components measured by the drive to be used in *I_q, Torque Producing Current* (04.002) and *Id, Magnetising Current* (04.017). This filter removes ripple components associated with the PWM switching. If *Current Feedback Filter Disable* (04.021) = 1, the filter is disabled and the user parameters are based on the current components sampled every 250us.

Parameter	04.024 User Current Maximum Scaling		
Short description	Defines the maximum for the torque reference and percentage load parameters		
Mode	Open-Loop		
Minimum	-VM_TORQUE_CURRENT_UNIPOLAR	Maximum	VM_TORQUE_CURRENT_UNIPOLAR
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

User Current Maximum Scaling (04.024) defines the variable maximum/minimums VM_USER_CURRENT and VM_USER_CURRENT_HIGH_RES which are applied to *Percentage Load* (04.020), *Torque Reference* (04.008) and *Torque Offset* (04.009). This is useful when routing these parameters to an analog output as it allows the full scale output value to be defined by the user.

The maximum value (VM_TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.

Parameter	04.025 Low Speed Thermal Protection Mode		
Short description	Set to enable low speed thermal protection mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Motor Thermal Time Constant 1* (04.015).

Parameter	04.026 Percentage Torque		
Short description	Shows the calculated torque as a percentage of rated torque		
Mode	Open-Loop		
Minimum	-VM_USER_CURRENT	Maximum	VM_USER_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

The shaft torque of the motor is estimated by the drive and *Percentage Torque* (04.026) gives this torque as a percentage of the expected torque defined by *Rated Torque* (04.041). The default value for *Rated Torque* (04.041) is zero which disables this feature so that *Percentage Torque* (04.026) is always zero. To enable the torque estimation system *Rated Torque* (04.041) should be set to the expected torque from the motor under rated conditions. For accurate torque estimation, and consistent results for both motoring and regenerating conditions, it is necessary to provide the drive with the core losses under no-load and rated load conditions at rated speed (i.e. *No-load Core Loss* (04.045) and *Rated Core Loss* (04.046) respectively). The drive will then include the core power loss in the torque calculation as

$$PCoreLoss = No-load Core Loss (04.045) + (Rated Core Loss (04.046) - No-load Core Loss (04.045)) \times (Torque Producing Current / Rated Torque Producing Current)$$

If *Rated Core Loss* (04.046) \leq *No-load Core Loss* (04.045) then only the no load value is used and $PCoreLoss = No-load Core Loss (04.045)$. This provides some compensation for core losses, but not the load dependent component. The core loss power values can be difficult to obtain except by experimental measurement because the loss mechanisms within the motor are complex and are affected by the PWM frequencies applied to the motor by the drive. It is possible to obtain an estimate for *No-load Core Loss* (04.045) during auto-tuning for RFC-A mode, but not RFC-S mode. As the auto-tuning algorithm cannot measure *Rated Core Loss* (04.046) this is set to zero, so that it is not used. If power dependent core losses are to be included *Rated Core Loss* (04.046) must be set by the user.

Parameter	04.036 Motor Protection Accumulator Power-up Value		
Short description	Defines the initial power-up value of the motor protection accumulator		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units

Coding	RW		

See *Motor Thermal Time Constant 1* (04.015).

Parameter	04.041 Rated Torque		
Short description	Rated torque used by the torque correction system		
Mode	Open-Loop		
Minimum	0.00	Maximum	50000.00
Default	0.00	Units	Nm
Type	32 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	2
Coding	RW		

The estimated torque (*Percentage Torque* (04.026)) is given as a percentage of *Rated Torque* (04.041). If *Rated Torque* (04.041) is left at the default value of zero then *Percentage Torque* (04.026) will remain at zero under all conditions.

Parameter	04.042 Torque Estimation Minimum Frequency		
Short description	Torque Estimation Minimum Frequency		
Mode	Open-Loop		
Minimum	0	Maximum	100
Default	5	Units	%
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

The drive estimates the motor shaft torque (*Percentage Torque* (04.026)), but at low output frequencies this estimate is very inaccurate. *Torque Estimation Minimum Frequency* (04.042) defines the point where the estimate of torque is too inaccurate to use and when the modulus of frequency is below this level *Percentage Torque* (04.026) is zero. The default value of 5% normally prevents a very inaccurate value of estimated torque at low frequencies, but if the stator resistance is very high it may be necessary to increase this threshold.

Parameter	04.045 No-load Core Loss		
Short description	Defines the no-load core loss for the motor used by the torque correction system		
Mode	Open-Loop		
Minimum	0.000	Maximum	99999.999

Menu 5 – *Motor Control*

Mode: Open-Loop

Parameter	05.001 Output Frequency		
Short description	Displays the frequency applied to the motor		
Mode	Open-Loop		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

If *Enable Frequency Slaving* (03.013) = 0 the *Output Frequency* (05.001) is the sum of the *Post Ramp Reference* (02.001) and the motor slip compensation frequency. If *Enable Frequency Slaving* (03.013) = 1 the *Output Frequency* (05.001) is given directly by the *Frequency Slaving Demand* (03.001).

Parameter	05.002 Output Voltage		
Short description	Displays the r.m.s. line to line voltage at the a.c. terminals of the drive		
Mode	Open-Loop		
Minimum	-VM_AC_VOLTAGE	Maximum	VM_AC_VOLTAGE
Default		Units	V
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, FI, VM, ND, NC, PT		

The *Output Voltage* (05.002) is the r.m.s. line to line voltage at the a.c. terminals of the drive.

Parameter	05.003 Output Power		
Short description	Displays the power flowing via the a.c. terminals of the drive		
Mode	Open-Loop		
Minimum	-VM_POWER	Maximum	VM_POWER
Default		Units	kW
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	3
Coding	RO, FI, VM, ND, NC, PT		

The *Output Power* (05.003) is the power flowing via the a.c. terminals of the drive. The power is derived as the dot product of the output voltage and current vectors, and so this is correct even if the motor parameters are incorrect and the motor model does not align the reference frame with the flux axis of a motor in RFC-A mode. For Open-loop, RFC-A and RFC-S modes a positive value of power indicates power flowing from the drive to motor. For Regen mode a positive value of power indicates power flowing from the supply to the regen drive.

Parameter	05.004 Motor Rpm		
Short description	Displays the estimated speed of the motor		
Mode	Open-Loop		
Minimum	-180000	Maximum	180000
Default		Units	rpm
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, FI, ND, NC, PT		

If *Enable Frequency Slaving* (03.013) = 0 (normal operation) the frequency used to derive the *Motor Rpm* (05.004) is the *Post Ramp Reference* (02.001). If *Enable Frequency Slaving* (03.013) = 1 (frequency slaving operation) the *Frequency Slaving Demand* (03.001) is used.

Motor Rpm (05.004) = 60 x Frequency / Pole pairs

where

Pole pairs = the numeric value of *Number Of Motor Poles* (05.011) (i.e. 3 for a 6 pole motor)

For frequency slaving operation there will be an error due to the motor slip frequency. For normal operation the result will be reasonably accurate provided that the slip compensation has been set up correctly.

Parameter	05.005 D.c. Bus Voltage		
Short description	Displays the voltage across the d.c. link of the drive		
Mode	Open-Loop		
Minimum	-VM_DC_VOLTAGE	Maximum	VM_DC_VOLTAGE
Default		Units	V
Type	16 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RO, FI, VM, ND, NC, PT		

D.c. Bus Voltage (05.005) gives the voltage across the d.c. link of the drive.

Parameter	05.006 Rated Frequency		
Short description	Set to the rated frequency of the motor		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	See exceptions below	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Region	Default Value
50Hz	50.0
60Hz	60.0

Rated Frequency (05.006) and *Rated Voltage* (05.009) define the frequency to voltage characteristic applied to the motor. See *Open-loop Control Mode* (05.014) for more details. *Rated Frequency* (05.006), *Rated Speed* (05.008) and *Number Of Motor Poles* (05.011) are used to calculate the rated slip of the motor for slip compensation.

$\text{Rated slip (Hz)} = \text{Rated Frequency (05.006)} - (\text{Pole pairs} \times \text{Rated Speed (05.008)} / 60)$

where

Pole pairs = the numeric value of *Number Of Motor Poles* (05.011) (i.e. 3 for a 6 pole motor)

If slip compensation is required *Rated Speed* (05.008) should be set to the motor nameplate value, which should give the correct compensation for a hot motor provide the nameplate value is correct. Slip compensation can be used throughout the speed range of the motor, i.e. below base speed and in the flux weakening region, to correct the motor speed to minimise the change of speed with load. *Rated Speed* (05.008) can be set to a value that is higher than synchronous speed to deliberately introduce speed droop, which can be used to aid load sharing with mechanically coupled motors.

Slip compensation is disabled under the following conditions:

1. *Rated Speed* (05.008) = 0
2. $\text{Rated Speed (05.008)} = \text{Rated Frequency (05.006)} \times 60 / \text{Pole pairs}$, i.e. synchronous speed.
3. *Enable Slip Compensation* (05.027) = 0

It should be noted that *Rated Speed* (05.008) is used to calculate the rotor time constant of the motor which is then used to determine the flux build-up time at the start of the catch a spinning motor algorithm. If spinning start is required (i.e. *Catch A Spinning Motor* (06.009) ≥ 1) then *Rated Speed* (05.008) should be set up correctly for the motor. If slip compensation is not required it can be disabled by setting *Enable Slip Compensation* (05.027) to 0.

It is possible to use the drive as a power supply with independent control of output voltage and frequency. The frequency is controlled with the normal frequency reference system and the voltage is controlled with *Rated Voltage* (05.009). To do this *Rated Frequency* (05.006) must be set to zero. However, *Rated Frequency* (05.006) is used in calculating the rated slip above rated frequency which would result in a very high slip frequency. To avoid this slip compensation is disabled if *Rated Frequency* (05.006) = 0.

Parameter	05.007 Rated Current		
Short description	Set to the rated current rated of the motor		
Mode	Open-Loop		
Minimum	-VM_RATED_CURRENT	Maximum	VM_RATED_CURRENT
Default	0.000	Units	A
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, VM, RA		

Rated Current (05.007) is used as follows:

Function	Details
Motor thermal protection	Defines the motor rated current.
Motor pre-heat	Motor pre-heat is set up as a percentage of rated current.
Motor control	Used in the motor control algorithm.
Current limits	Current limits are set up as a percentage of rated torque producing current.

Parameter	05.008 Rated Speed		
Short description	Set to the rated speed of the motor		
Mode	Open-Loop		
Minimum	0	Maximum	35940
Default	See exceptions below	Units	rpm
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Region	Default Value
50Hz	1500
60Hz	1800

See *Rated Frequency* (05.006).

Parameter	05.009 Rated Voltage		
Short description	Set to the rated voltage of the motor		
Mode	Open-Loop		
Minimum	-VM_AC_VOLTAGE_SET	Maximum	VM_AC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Region	Default Value
200V	All	230
400V	50Hz	400
400V	60Hz	460
575V	All	575
690V	All	690

Rated Frequency (05.006) and *Rated Voltage* (05.009) define the frequency to voltage characteristic applied to the motor. See *Open-loop Control Mode* (05.014) for more details.

Parameter	05.010 Rated Power Factor		
Short description	Set to the rated power factor of the motor. This value can be measured by the drive during a rotating autotune.		
Mode	Open-Loop		
Minimum	0.000	Maximum	1.000
Default	0.850	Units	
Type	16 Bit User Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	3
Coding	RW, RA		

Rated Power Factor (05.010) is the true power factor of the motor under rated conditions, i.e. the cosine of the angle between the motor voltage and current. If *Stator Inductance* (05.025) is set to a non-zero value then the stator inductance is used to calculate the rated magnetising current for the motor and the rated power factor can be calculated by the drive. Therefore if *Stator Inductance* (05.025) is non-zero *Rated Power Factor* (05.010) is continuously set to the calculated value of rated power factor by the drive. If *Stator Inductance* (05.025) is set to zero then *Rated Power Factor* (05.010) is used to estimate the rated magnetising current which is an approximation and not as accurate. *Stator Inductance* (05.025) can be measured by the drive during auto-tuning and this is the preferred option, however, if it is not possible to obtain the value for *Stator Inductance* (05.025) then *Rated Power Factor* (05.010) should be set to the motor nameplate value.

Parameter	05.011 Number Of Motor Poles		
Short description	Set to the number of poles of the motor		
Mode	Open-Loop		
Minimum	0	Maximum	240
Default	0	Units	PolePairs
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

* The units relate to the numeric value of the parameter and not the text string.

The numeric value in *Number Of Motor Poles* (05.011) should be set to the number of motor pole pairs (i.e. number of motor poles / 2). The text strings associated with *Number Of Motor Poles* (05.011) show the number of motor poles (i.e. the parameter value x 2). If a linear position feedback device is used *Number Of Motor Poles* (05.011) should be set to 1 (2 Poles).

If *Number Of Motor Poles* (05.011) = 0 the number of motor poles are calculated automatically as given below.

Pole pairs = $60 \times \text{Rated Frequency (05.006)} / \text{Rated Speed (05.008)}$ rounded down to the nearest integer.

Parameter	05.012 Auto-tune		
Short description	Defines the auto-tune test to be performed		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE, NC		

Value	Text
0	None
1	Basic
2	Improved

The following describes how an auto-tune test can be initiated and normal operation can be resumed after the test for Open-loop mode:

1. An auto-tune test cannot be initiated if the drive is tripped or the drive inverter is active, i.e. *Drive Healthy* (10.001) = 0 or *Drive Active* (10.002) = 1. The inverter can be made inactive by ensuring that the Final drive enable is inactive, or the Final drive run is inactive and *Hold Zero Speed* (06.008) = 0.
2. An auto-tune test is initiated by setting *Auto-tune* (05.012) to a non-zero value and making the Final drive enable and the Final drive run active.
3. All tests that move the motor will move the motor in the forward direction if *Reverse Select* (01.012) = 0 or the reverse direction if *Reverse Select* (01.012) = 1.
4. If the auto-tune sequence is completed successfully the Final drive enable is set to the inactive state and *Auto-tune* (05.012) is set to zero. The Final drive enable can only be set to the active state again by removing the enable and reapplying it. The enable can be removed by setting *Drive Enable* (06.015) = 0, or by setting bit 0 of the *Control Word* (06.042) to 0 provided *Control Word Enable* (06.043) = 1, or by making *Hardware Enable* (06.029) = 0.
5. If a trip occurs during the auto-tune sequence the drive will go into the trip state and *Auto-tune* (05.012) is set to zero. As in 4. above the enable must be removed and re-applied before the drive can be restarted after the trip has been reset. However, care should be taken because if the auto-tune was not completed the drive parameters that should have been measured and set up will still have their original values.
6. If the Final drive enable is made active, the Final drive run is inactive and *Hold Zero Speed* (06.008) = 1 the drive would normally be in the Stop state (i.e. the inverter is active, but the frequency or speed reference is 0).

The following describes the effects of the auto-tune test on the drive parameters for Open-loop mode:

1. All auto-tune tests rely on the motor being stationary when the test is initiated to give accurate results.
2. If *Select Motor 2 Parameters* (11.045) = 0 then the parameters associated with motor map 1 are updated as a result of the test, and if *Select Motor 2 Parameters* (11.045) = 1 the parameters associated with motor map 2 are updated.
3. When each stage of the test is complete the results written to the appropriate parameters and these parameters saved in the drive non-volatile memory. If *Parameter Cloning* (11.042) is set to 3 or 4 the parameters are also written to a non-volatile media card fitted in the drive.

The table below shows the parameters required for motor control indicating which should be set by the user and which can be measured with an auto-tune test.

Parameter	Required for	Measured in test
<i>Rated Frequency</i> (05.006)	Basic control	User set-up
<i>Rated Current</i> (05.007)	Basic control	User set-up
<i>Rated Speed</i> (05.008)	Slip compensation Spinning start	User set-up
<i>Rated Voltage</i> (05.009)	Basic control	User set-up
<i>Rated Power Factor</i> (05.010)	Basic control	2
<i>Stator Resistance</i> (05.017)	Ur, Ur I, Ur S and Ur Auto modes Spinning start	1, 2
<i>Transient Inductance</i> (05.024)	Improved performance	1, 2
<i>Stator Inductance</i> (05.025)	Improved performance	2
<i>Maximum Deadtime Compensation</i> (05.059)	Basic control	1, 2
<i>Current At Maximum Deadtime Compensation</i> (05.060)	Basic control	1, 2
<i>No-load Core Loss</i> (04.045)	Torque feedback*	2
<i>Rated Core Loss</i> (04.046)	Torque feedback*	User set-up

*Torque feedback is provided in *Percentage Torque* (04.026). The estimated value can be improved by setting up the *No-load Core Loss* (04.045) and *Rated Core Loss* (04.046) for the motor. It should be noted that the core loss characteristic for a motor is complex and depends to some extent on the switching frequency, but the drive can include an approximation to the core losses based on these two parameters. The value for the no-load core losses measured by the auto-tuning is likely to be higher than the actual value, but can be used to significantly reduce the difference that will be seen in the estimate torque between motoring and regenerating operation. If more accurate core loss compensation is required *No-load Core Loss* (04.045) and *Rated Core Loss* (04.046) must be set up based on testing the motor using a torque transducer.

1: Basic

This test measures the basic control parameters without moving the motor.

1. A stationary test is performed to measure *Stator Resistance* (05.017), *Transient Inductance* (05.024), *Maximum Deadtime Compensation* (05.059) and *Current At Maximum Deadtime Compensation* (05.060). If *Enable Stator Compensation* (05.049) = 1 then *Stator Base Temperature* (05.048) is made equal to *Stator Temperature* (05.046).

2: Improved

This test measures the parameters for improved performance by rotating the motor.

1. Auto-tune test 1 is performed.
2. A rotating test is performed in which the motor is accelerated with the currently selected ramps up to a frequency of *Rated Frequency* (05.006) x 2/3, and the frequency is maintained at that level for 4 seconds. *Stator Inductance* (05.025) is measured and this value is used in conjunction with other motor parameters to calculate *Rated Power Factor* (05.010). The no-load motor core losses are measured and written to *No-load Core Loss* (04.045). It is not possible to measure the rated load motor core losses, and so *Rated Core Loss* (04.046) is set to zero. The motor should be unloaded for this test.

The table below shows the trips that can occur during an auto-tune test:

Trip	Reason	Trip can occur in test
<i>Autotune Stopped</i>	The final drive enable or the final drive run were removed before the test was completed.	All
<i>Resistance.001</i>	The measured value of <i>Stator Resistance</i> (05.017) exceeded a value of $(V_{FS} / \sqrt{2}) / \text{Full Scale Current } Kc$ (11.061), where V_{FS} is the full scale d.c. link voltage.	All
<i>Resistance.002</i>	It has not been possible to measure the drive inverter characteristic to define <i>Maximum Deadtime Compensation</i> (05.059) and <i>Current At Maximum Deadtime Compensation</i> (05.060).	All

Parameter	05.013 <i>Dynamic V To F Select</i>		
Short description	Set to 1 to enable Dynamic V to F mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Dynamic V to F mode is intended for applications where power loss should be kept to a minimum under low load conditions, but dynamic performance is not important. The reduction in power loss under low load conditions is achieved by increasing the rated frequency used to derive the frequency to voltage characteristic of the drive with reduced load. If *Dynamic V To F Select* (05.013) = 0 then *Rated Frequency* (05.006) is used directly to define the output voltage characteristic. If *Dynamic V To F Select* (05.013) = 1 then a modified value of rated frequency is used when $|\text{Percentage Load (04.020)}|$

$\text{rated frequency} = \text{Rated Frequency (05.006)} \times [2 - |\text{Percentage Load (04.020)}|] / 70.0\%$

For higher load levels *Rated Frequency* (05.006) is used directly.

Parameter	05.014 Open-loop Control Mode		
Short description	Defines the drive output mode, which can either be a voltage mode or a current mode		
Mode	Open-Loop		
Minimum	0	Maximum	5
Default	4	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Ur S
1	Ur
2	Fixed
3	Ur Auto
4	Ur I
5	Square

Open-loop Control Mode (05.014) defines the drive output mode, which can either be a voltage mode or a current mode as given below. It should be noted that the maximum output voltage of the drive is limited to a level just below *D.c. Bus Voltage* (05.005) / $\sqrt{2}$. Therefore, if the drive is being supplied via its own rectifier input stage the output voltage is limited to a level just below that of the supply voltage. If the drive is operating in voltage mode the output voltage is limited to *Rated Voltage* (05.009) or the maximum possible output voltage whichever is the lowest. (If *Quasi-square Enable* (05.020) = 1 the maximum possible output voltage can be increased. See *Quasi-square Enable* (05.020) for details.)

0: Ur S (Resistance compensation, stator resistance measured at each start)

Resistance compensation is a form of stator flux oriented sensorless motor control. A linear frequency to voltage characteristic is used where the drive output voltage is increased from 0V to *Rated Voltage* (05.009). as the *Output Frequency* (05.001) increases from 0Hz to *Rated Frequency* (05.006). When the *Output Frequency* (05.001) is above *Rated Frequency* (05.006) the output voltage is limited to *Rated Voltage* (05.009). Vector based stator resistance compensation is applied below *Rated Frequency* (05.006)/4 and then this is tapered out from *Rated Frequency* (05.006)/4 to *Rated Frequency* (05.006)/2. This method controls the flux level correctly in the motor in the steady state provided the correct value of *Stator Resistance* (05.017) is used.

The *Stator Resistance* (05.017) is measured each time the drive is started. This test can only be done with a stationary motor where the flux has decayed to zero. Therefore this mode should only be used if the motor is guaranteed to be stationary each time the drive is enabled. To ensure that the measurement is not carried out before the flux has decayed, there is a period of one second after the inverter has been disabled during which the test is not carried out if the drive is re-started. The *Stator Resistance* (05.017) is not automatically saved in non-volatile memory after each test.

1: Ur (Resistance compensation with no stator resistance measurement)

Resistance compensation is used as in Ur S mode, but the *Stator Resistance* (05.017) is not measured.

2: Fixed (Fixed boost with linear characteristic)

A fixed frequency to voltage characteristic is used as shown below where the voltage at 0Hz is defined by *Low Frequency Voltage Boost* (05.015).

3: Ur Auto (Resistance compensation, stator resistance measured on first start)

Resistance compensation is used as in Ur S mode, but the *Stator Resistance* (05.017) is only measured once when the drive is first enabled. After the test has been completed successfully the mode is changed to Ur mode and *Stator Resistance* (05.017) is saved to non-volatile memory. If *Parameter Cloning* (11.042) is set to 3 or 4 the *Stator Resistance* (05.017) is also written to a non-volatile media card fitted in the drive. If the test fails the mode is changed to Ur mode, but *Stator Resistance* (05.017) is not updated.

4: Ur I (Resistance compensation, stator resistance measured at power-up)

Resistance compensation is used as in Ur S mode, but the *Stator Resistance* (05.017) is only measured when the drive is enabled for the first time after each power-up.

5: Square (Fixed boost with square characteristic)

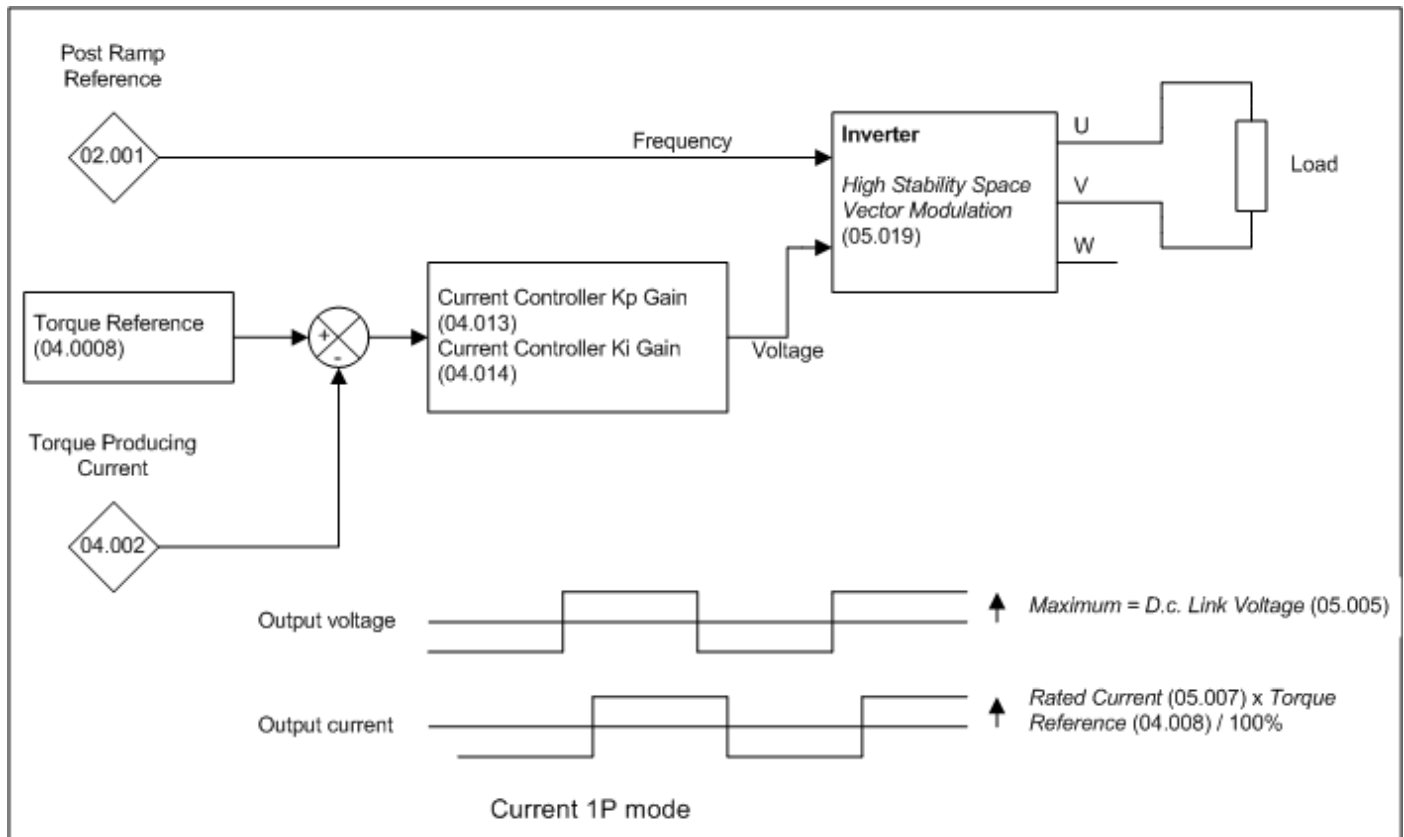

A fixed square frequency to voltage characteristic is used as shown below. When the |*Output Frequency* (05.001)| is below *Rated Frequency* (05.006) the *Output Voltage* (05.002) is given by:

$$\text{Output Voltage (05.002)} = \text{Low Frequency Voltage Boost (05.015)} + [\text{Rated Voltage (05.009)} - \text{Low Frequency Voltage Boost (05.015)}] \times (\text{Output Frequency (05.001)} / \text{Rated Frequency (05.006)})^2$$

6: Current 1P (Single phase current output)

If this mode is selected it overrides all the normal control system for Open-loop mode and is used to produce a single phase square wave current output using the system shown below.

The load should be connected between the U and V phases as shown. The drive attempts to produce a square wave of output current at the frequency defined by the *Post Ramp Reference* (02.001). The magnitude of the current is controlled by the *Torque Reference* (04.008) as a percentage of the

Rated Current (05.007). *I_q, Torque Producing Current* (04.002) shows the magnitude of the output current, which for a square wave is the same as the r.m.s. value of current. The following should be noted about this control mode:

1. *I_d, Magnetising Current* (04.017) remains at zero, and *Current Magnitude* (04.001) = *I_q, Torque Producing Current* (04.002).
2. *Output Power* (05.003) shows the correct magnitude of output power flowing from the drive, but this will always be positive whatever the phase relationship between the output current and voltage.
3. The maximum possible output voltage from the drive is a square wave with a magnitude approximately equal to the *D.c. Bus Voltage* (05.005).
4. High performance current controller mode is used and the current controller gains should be set up based on the load impedance for this mode as defined in the description of *Current Controller K_p Gain* (04.013) for RFC-A and RFC-S modes.
5. The drive thermal model will provide protection for the drive as though the output frequency is 0Hz whatever the value of the *Post Ramp Reference* (02.001). This should be taken into account because the thermal capabilities of the drive in this mode are the same as other modes when the motor is at standstill.

Parameter	05.015 Low Frequency Voltage Boost		
Short description	Defines the level of voltage boost at 0Hz when using a fixed V to F relationship		
Mode	Open-Loop		
Minimum	0.0	Maximum	25.0
Default	3.0	Units	%
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

The default value for this parameter depends on the frame size of the drive as follows:

- 3.0% up to frame size 06 drives,
- 2.0% for frame size 07 and frame size 08 drives
- 1.0% for larger sizes

See *Open-loop Control Mode* (05.014).

Parameter	05.017 Stator Resistance		
Short description	Defines the resistance of the motor stator		
Mode	Open-Loop		
Minimum	0.000000	Maximum	1000.000000
Default	0.000000	Units	Ω
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	6
Coding	RW, RA		

The *Stator Resistance* (05.017), *Transient Inductance* (05.024) and *Stator Inductance* (05.025) are derived from the star connected per phase equivalent circuit of an induction motor shown below.

The steady state parameters are converted to equivalent transient model parameters:

$$R_s = R_1$$

$$L_m = L_m$$

$$L_s = L_1 + L_m$$

$$L_r = L_2 + L_m$$

$$\sigma L_s = L_s - (L_m^2 / L_r)$$

The equivalent drive parameters are:

Stator Resistance (05.017) = R_s

Transient Inductance (05.024) = σL_s

Stator Inductance (05.025) = L_s

Stator Resistance (05.017) is used as described in the table below.

Function	Details
Motor control	Voltage characteristic adjustment with current

Parameter	05.018 Maximum Switching Frequency		
Short description	Defines the maximum switching frequency that can be used by the drive		
Mode	Open-Loop		
Minimum	0	Maximum	VM_SWITCHING_FREQUENCY
Default	4	Units	kHz
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE, VM, RA		

Value	Text
0	2
1	3
2	4
3	6
4	8
5	12
6	16

Maximum Switching Frequency (05.018) should be set to the required PWM switching frequency. The drive inverter will operate at this frequency unless the inverter temperature becomes too hot. Under these conditions the drive will reduce the switching frequency in an attempt to avoid tripping (see *Auto-switching Frequency Change* (05.035)). The actual switching frequency is shown in *Switching Frequency* (05.037). The switching frequency has a direct effect on the sample rate for the current controllers (see *Current Controller Kp Gain* (04.013)). All other control tasks are at a fixed rate.

Task	
Speed controller (RFC-A, RFC-S)	250µs
D.c. link voltage controller	1ms
Flux controller (RFC-A, RFC-S)	1ms

Parameter	05.019 High Stability Space Vector Modulation		
Short description	Set to 1 to enable High Stability Space Vector Modulation		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *High Stability Space Vector Modulation* (05.019) = 0 standard space vector modulation is used to derive the inverter control signals. If *High Stability Space Vector Modulation* (05.019) = 1 a modified form of space vector modulation is selected which can give the following advantages:

1. With some motors instability can occur when operating below *Rated Frequency* (05.006) / 2 especially with light loads and high switching frequency. The preferred method to solve this problem is to use RFC-A mode without position feedback. However, if Open-loop mode is required, the instability can sometimes be reduced by selecting high stability space vector modulation.
2. As the output voltage approaches the maximum available from the drive pulse deletion occurs. This can cause unstable operation with a lightly or fully loaded motor. High stability space vector modulation will reduce this effect.

The disadvantages of using high stability space vector modulation are:

1. Increased acoustic noise from the motor.
2. A reduction in the thermal capability of the drive at low output frequencies.

Parameter	05.020 Quasi-square Enable		
Short description	Set to 1 to change the output voltage to a quasi-square wave		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Quasi-square Enable* (05.020) = 0 then the output of the drive is limited to a modulation index of unity, which limits the output voltage to a level just below *D.c. Bus Voltage* (05.005) / $\sqrt{2}$. Therefore, if the drive is being supplied via its own rectifier input stage the output voltage is limited to a level just below that of the supply voltage or *Rated Voltage* (05.009) whichever is lower.

If *Quasi-square Enable* (05.020) = 1 then the limit imposed by *Quasi-square Enable* (05.020) is ignored and the modulation index is allowed to increase beyond unity. As the output voltage increases the output voltage changes through trapezoidal waveforms to a quasi-square wave output. This mode is useful where the ratio between the switching frequency and the fundamental output frequency is less than 12, as it removes any sub-harmonic effects that occur. However, it does produce significant multiple odd harmonics of the output frequency in the output currents which cause acoustic noise, torque ripple and motor heating.

Parameter	05.024 Transient Inductance		
Short description	Defines the inductance of the transient components in the motor stator		
Mode	Open-Loop		
Minimum	0.000	Maximum	500.000
Default	0.000	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, RA		

See *Stator Resistance* (05.017).

Transient Inductance (05.024) is used as described in the table below.

Function	Details
Current controller proportional gain set-up	During auto-tuning the stator resistance is used in the calculation of the current controller proportional gain.
High performance current control	If high performance current control is selected (<i>Current Controller Mode</i> (04.030)) the transient inductance is used.
Voltage based torque limit	The system that prevent the motor from exceeding its voltage based torque limit used the transient inductance.
Sensorless mode control	If sensorless mode is selected the transient inductance is used in defining the flux axis of the motor.

Parameter	05.025 Stator Inductance		
Short description	Defines the inductance of the motor stator		
Mode	Open-Loop		
Minimum	0.00	Maximum	5000.00
Default	0.00	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, RA		

See *Stator Resistance* (05.017).

Stator Inductance (05.025) is used as described in the table below.

Function	Details
Rated current components	Along with the stator resistance and transient inductance, the stator inductance is used to calculate the flux producing and torque producing current components, and the power factor.
Voltage based torque limit	The system that prevent the motor from exceeding its voltage based torque limit used the transient inductance.
Voltage feed-forwards	Voltage feed-forwards is provided for the current controllers which improves performance and reduces transient when starting with position feedback.
Flux level	The stator inductance is used to set the correct flux level in the motor.

Parameter	05.027 <i>Enable Slip Compensation</i>		
Short description	Set to 1 to enable slip compensation		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Rated Frequency* (05.006).

Parameter	05.031 <i>Voltage Controller Gain</i>		
Short description	Defines the proportional gain of the d.c. link voltage controller		
Mode	Open-Loop		
Minimum	1	Maximum	30
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Voltage Controller Gain (05.031) can be used to modify the proportional gain of the d.c. link voltage controller used for standard ramp and supply loss control.

Parameter	05.035 <i>Auto-switching Frequency Change</i>		
Short description	Defines auto-switching frequency control with thermal model		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Enabled
1	Disabled
2	No Ripple Detect

The drive inverter can be damaged if the temperature is too high. The inverter can also be damaged or the lifetime of the power devices reduced, if the temperature ripple of the devices is too high. *Auto-switching Frequency Change* (05.035) defines the action taken if the drive inverter becomes too hot or the temperature ripple becomes too high.

Enabled:

If the inverter becomes too hot or the ripple temperature is higher than the level defined by *Maximum Inverter Temperature Ripple* (05.039) the switching frequency is reduced in an attempt to prevent tripping.

Disabled:

The switching frequency is not reduced, and so the drive will trip if the inverter is too hot or the temperature ripple is too high.

No Ripple Detect:

The switching frequency is reduced if the inverter temperature, but not the temperature ripple is too high. If the temperature ripple exceeds the level defined by *Maximum Inverter Temperature Ripple* (05.039) then the drive will trip.

The switching frequency is changed in steps defined by *Auto-switching Frequency Step Size* (05.036). For example with a switching frequency of 16kHz and a step size of two, the frequency will be reduced to 8kHz, then 4kHz etc. *Minimum Switching Frequency* (05.038) defines the minimum switching frequency that the system will attempt to use. If the switching frequency needs to switch to a lower level, then the drive will trip. If *Minimum Switching Frequency* is changed the new value will only become active when *Switching Frequency* is at or above the minimum value.

Parameter	05.036 <i>Auto-switching Frequency Step Size</i>		
Short description	Auto-switching frequency reduction step size		
Mode	Open-Loop		
Minimum	1	Maximum	2
Default	2	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Auto-switching Frequency Change* (05.035).

Parameter	05.037 <i>Switching Frequency</i>		
Short description	Displays the current switching frequency used by the drive		
Mode	Open-Loop		
Minimum	0	Maximum	6
Default		Units	kHz
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	2

See *Auto-switching Frequency Change* (05.035).

Parameter	05.039 <i>Maximum Inverter Temperature Ripple</i>		
Short description	Maximum Inverter Temperature Ripple		
Mode	Open-Loop		
Minimum	20	Maximum	60
Default	60	Units	°C
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW		

Maximum Inverter Temperature Ripple (05.039) defines the maximum inverter temperature ripple allowed before the switching frequency is reduced. See *Auto-switching Frequency Change* (05.035).

Parameter	05.040 <i>Spin Start Boost</i>		
Short description	Defines the level of spin start boost used by the algorithm that detects the speed of a spinning motor		
Mode	Open-Loop		
Minimum	0.0	Maximum	10.0
Default	1.0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Spin Start Boost (05.040) is used by the algorithm that detects the speed of a spinning motor when the drive is enabled and *Catch A Spinning Motor* (06.009) ≥ 1 . For most motors *Spin Start Boost* (05.040) does not need to be changed from the default value, but for some larger motors *Spin Start Boost* (05.040) may need to be increased. If *Spin Start Boost* (05.040) is too small the drive will detect zero speed whatever the speed of the motor, and if *Spin Start Boost* (05.040) is too large the motor may accelerate away from standstill when the drive is enabled.

Parameter	05.042 Reverse Output Phase Sequence		
Short description	Set to 1 to reverse the sequence on the output phases		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Reverse Output Phase Sequence* (05.042) = 0 the output phase sequence is U-V-W when *Output Frequency* (05.001) is positive and W-V-U when *Output Frequency* (05.001) is negative. If *Reverse Output Phase Sequence* (05.042) = 1 the output phase sequence is reversed so that the phase sequence in W-V-U for positive frequencies and U-V-W for negative frequencies.

Parameter	05.044 Stator Temperature Source		
Short description	Defines the source of the stator temperature		
Mode	Open-Loop		
Minimum	1	Maximum	6
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE

See *Stator Temperature Source* (05.044).

Parameter	05.047 Stator Temperature Coefficient		
Short description	Defines the coefficient used to calculate the temperature of the motor stator		
Mode	Open-Loop		
Minimum	0.00000	Maximum	0.10000
Default	0.00390	Units	1/°C
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	5
Coding	RW		

Temperature Compensated Stator Resistance (05.050) shows the stator resistance from the active motor that is being used by the drive for motor control. If *Enable Stator Compensation* (05.049) = 0 and motor 1 is selected then *Temperature Compensated Stator Resistance* (05.050) is equal to *Stator Resistance* (05.017). If *Enable Stator Compensation* (05.049) = 1 the value of *Stator Resistance* (05.017) is not changed, but *Temperature Compensated Stator Resistance* (05.050) is derived as follows:

α = *Stator Temperature Coefficient* (05.047) and this is the temperature coefficient for the stator winding at 20°C as a proportion of the resistance per degree C.

Temperature Compensated Stator Resistance (05.050) = *Stator Resistance* (05.017) x [1 + (*Stator Temperature* (05.046) – 20°C) x α] / [1 + (*Stator Base Temperature* (05.048) - 20°C) x α]

Stator Resistance (05.017) and *Stator Base Temperature* (05.048) can be set up by the user with the stator resistance at a given temperature. The preferred method is for the *Stator Resistance* (05.017) to be measured and set up using the auto-tuning system (See *Auto-tune* (05.012)). If *Enable Stator Compensation* (05.049) = 1 when the auto-tuning is carried out the *Stator Base Temperature* (05.048) will be updated automatically with *Stator Temperature* (05.046).

The temperature compensation system can only function correctly if the *Stator Temperature Coefficient* (05.047) is set up correctly. The default value is suitable for copper or aluminium windings and should not need to be adjusted for these materials provided the temperature measurement is a reasonable measure of the winding temperature. If the temperature measurement is not closely coupled to the winding it may be necessary to adjust *Stator Temperature Coefficient* (05.047) for correct compensation.

Parameter	05.048 Stator Base Temperature		
Short description	Defines the base temperature used to calculate the temperature of the motor stator		
Mode	Open-Loop		
Minimum	-50	Maximum	300
Default	0	Units	°C

The rotor temperature can be used to compensate for changes in rotor resistance that affects the motor slip and hence the rated speed in Open-loop or RFC-A mode, or the magnet flux that affects motor torque in RFC-S mode. See *Rotor Temperature Coefficient* (05.054) for details. *Rotor Temperature Source* (05.051) is used to select the source for the rotor temperature measurement.

Rotor Temperature Source (05.051)	Source	Comments
0	Analog Input 3 Thermistor Temperature (07.050)	Analog input 3 must be set up for the correct temperature feedback device
1	User Rotor Temperature (05.052)	The user can provide a rotor temperature value if an alternative feedback device is to be used or the user provides an algorithm to model the rotor temperature
2	P1 Thermistor Temperature (03.122)	P1 position feedback interface must be set up for the correct temperature feedback device
3-6	Option Slot P1 Thermistor Temperature (xx.122)	A position feedback category option module must be fitted and the P1 position feedback must be set up for the correct temperature feedback device

Parameter	05.052 User Rotor Temperature

Display Format	Standard	Decimal Places	5
Coding	RW		

The slip of an induction motor is proportional to the rotor resistance, and so as the motor becomes hotter the slip increases. Therefore the rated speed

used to derive the slip compensation should be changed with rotor temperature to remove the motor speed variation caused by the change of rotor temperature. *Temperature compensated rated speed* (05.057) shows the rated speed from the active motor that is used to derive the slip compensation. If *Enable Rotor Compensation* (05.056) = 0 and motor 1 is selected (i.e. *Motor 2 Active* (21.015) = 0) then *Temperature compensated rated speed* (05.057) is equal to *Rated Speed* (05.008) and the rated slip used for slip compensation is based on *Rated Frequency* (05.006) and *Rated Speed* (05.008). If *Enable Rotor Compensation* (05.056) = 1 then *Temperature compensated rated speed* (05.057) is calculated as follows:

Uncompensated Rated Slip = Synchronous Speed - *Rated Speed* (05.008) = (*Rated Frequency* (05.006) x 60 / *Number Of Motor Poles* (05.011)) - *Rated Speed* (05.008)

α = *Rotor Temperature Coefficient* (05.054) and this is the rotor winding temperature coefficient at 20°C as a proportion of the resistance per degree C.

Compensated Rated Slip = Uncompensated Rated Slip x [1 + (*Rotor Temperature* (05.053) - 20°C) x α] / [1 + (*Rotor Base Temperature* (05.055) - 20°C) x α]

Temperature compensated rated speed (05.057) = (*Rated Frequency* (05.006) x 60 / *Number Of Motor Poles* (05.011)) - Compensated Rated Slip

Rated Speed (05.008) should be the rated speed of the motor with *Rotor Temperature* (05.053) equal to *Rotor Base Temperature* (05.055). These values should be set up by the user. It is likely that the available temperature measurement will give the temperature of the stator windings. The default value of *Rotor Temperature Coefficient* (05.054) is the temperature coefficient for aluminium or copper at 20°C as one of these materials is normally used for the rotor bars of an induction motor. However, if the thermal coupling between the rotor and the temperature measuring device is poor it may be necessary to adjust *Rotor Temperature Coefficient* (05.054) to give better compensation.

Parameter	05.055 Rotor Base Temperature		
Short description	Defines the base temperature used to calculate the temperature of the rotor		
Mode	Open-Loop		
Minimum	-50	Maximum	300
Default	0	Units	°C
Type	16 Bit User Save	Update Rate	Background read

See *Rotor Temperature Coefficient* (05.054).

Parameter	05.057 Temperature compensated rated speed		
Short description	Final rated speed value used by the drive including temperature compensation		
Mode	Open-Loop		
Minimum	0.00	Maximum	35940.00
Default		Units	rpm
Type	32 Bit Volatile	Update Rate	Background
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Temperature compensated rated speed (05.057) shows the rated speed value for the active motor that is being used by the drive including the effect of temperature compensation.

Parameter	05.059 Maximum Deadtime Compensation		
Short description	Maximum Deadtime Compensation		
Mode	Open-Loop		
Minimum	0.000	Maximum	10.000
Default	0.000	Units	µs
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RO, NC, PT		

Maximum Deadtime Compensation (05.059) is the deadtime compensation used to compensate for dead-time effects in the inverter. This level of compensation is used when the drive output current is above *Current At Maximum Deadtime Compensation* (05.060). Both of these values related to dead-time compensation are measured during auto-tuning and cannot be set by the user. It should be noted that if the auto-tuning test is not performed and *Maximum Deadtime Compensation* (05.059) = 0 then a factory defined value is used for dead-time compensation. Although it is not recommended, it is possible to disable dead-time compensation by setting *Disable Deadtime Compensation* (05.061) = 1.

Parameter	05.060 <i>Current At Maximum Deadtime Compensation</i>

Menu 6 – Sequencer and Clock

Mode: Open-Loop

The diagram below shows the sequencer for Open-loop mode.

The sequencer, which provides overall control of the drive, is implemented in two stages. The first stage includes the enable logic and sequencer logic

and consists of static logic elements. The second stage is a state machine with internal states.

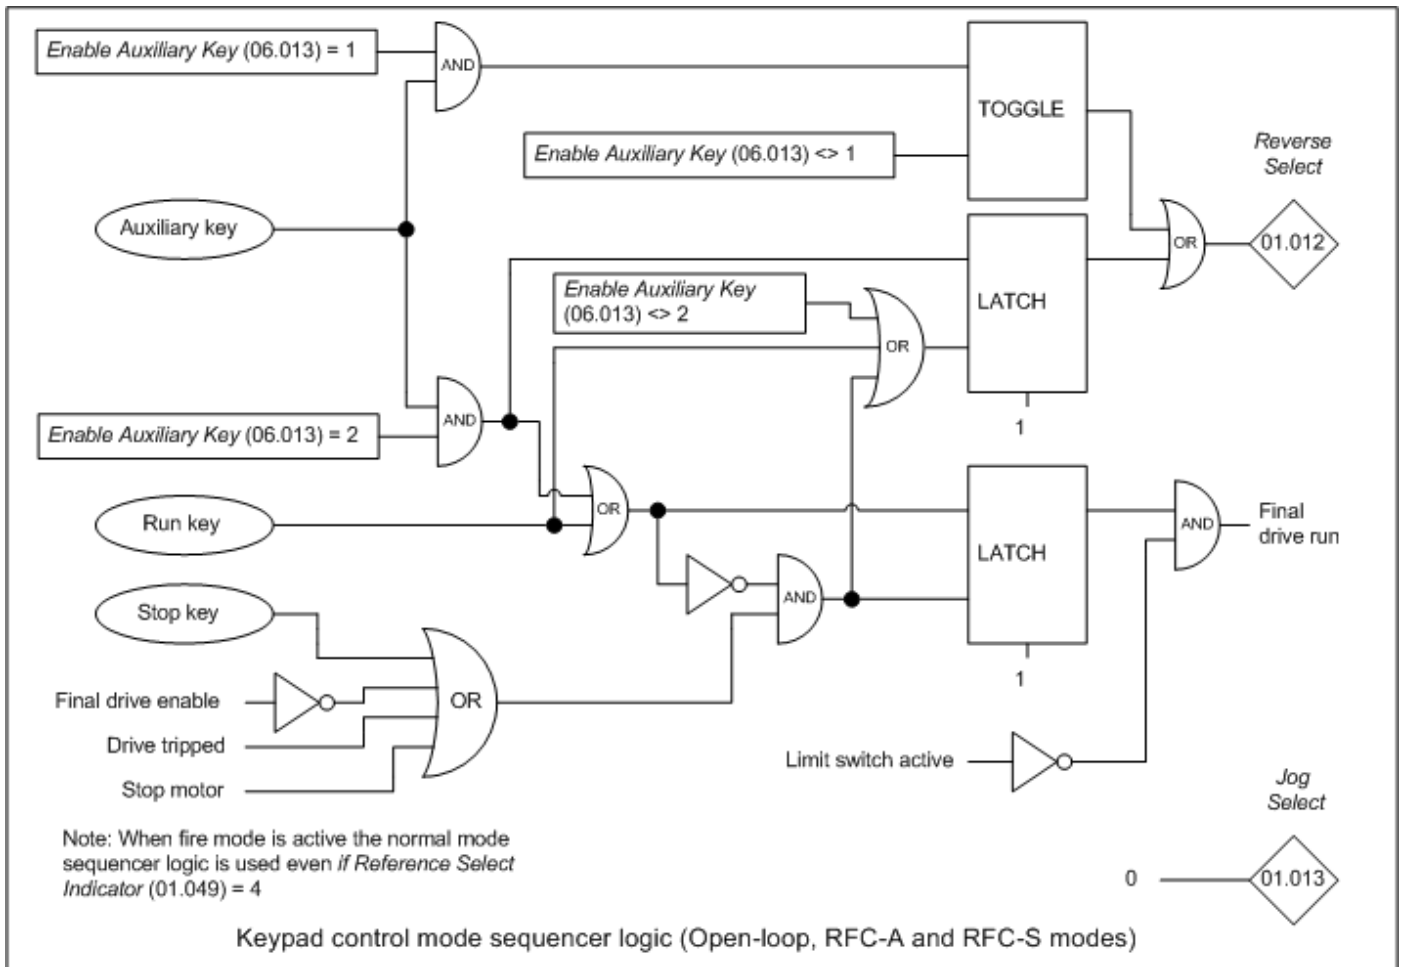

Hardware Enable (06.029) follows the safe torque off enable signal provided none of the digital inputs that are integral to the drive are routed to the *Hardware Enable* (06.029). The safe torque off hardware includes a delay in detecting a change from the enable to disable state of up to 20ms, but for most applications this is not a problem. However, a faster disable time can be achieved (600us) if digital input 4 or 5 on the drive is routed to the *Hardware Enable* (06.029).

If the safety function of the safe torque off input is required then there must not be a direct connection between the safe torque off input and any other digital I/O on the drive. If the safety function of the safe torque off input and a fast disable function are required together, then the drive should be given two separate independent enable input signals. A signal from a safe source should be connected to the safe torque off input on the drive. A second enable should be connected to the digital I/O selected for the fast disable function. The circuit must be arranged so that a fault which causes the fast input to be forced high cannot cause the safe torque off input to be forced high as well, including the case where a component such as a blocking diode has failed.

The diagram below shows the sequencer logic when *Reference Selected Indicator* (01.049) is not equal to 4 (i.e. keypad control mode is not selected). The definition of the logic symbols are given below.

The diagram below shows the sequencer logic when Reference Selected Indicator (01.049) = 4 (i.e. keypad control mode is selected). The definition of the logic symbols are given below.

Parameter	06.001 Stop Mode		
Short description	Defines how the motor is controlled when the run signal is removed from the drive		
Mode	Open-Loop		
Minimum	0	Maximum	5
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Coast
1	Ramp
2	Ramp dc I
3	dc I
4	Timed dc I
5	Disable

Stopping is in two distinct phases as shown in the table below for each of the possible values of *Stop Mode* (06.001).

Stop Mode (06.001)	Phase 1	Phase 2	Phase 3
0: Coast	Inverter disabled	Drive cannot be re-enabled for 1s	Delay in phase 2 allows rotor flux to decay
1: Ramp	Ramp down to zero frequency	Wait for 1s with inverter enabled	
2: Ramp followed by d.c. injection	Ramp down to zero frequency	Inject d.c. at a level defined by <i>Injection Braking Level</i> (06.006) for a time defined by <i>Injection Braking Time</i> (06.007)	
3: D.c. injection with zero speed detection	Low frequency current injection with detection of low speed before next phase	Inject d.c. at a level defined by <i>Injection Braking Level</i> (06.006) for a time defined by <i>Injection Braking Time</i> (06.007)	The drive automatically senses low speed and adjusts the injection time to suit the application
4: Timed d.c. injection stop	Inject d.c. at a level defined by <i>Injection Braking Level</i> (06.006) for a time defined by <i>Injection Braking Time</i> (06.007)	No phase 2	
5: Disable	Inverter disabled	No phase 2	Allows drive to be disabled then re-enabled immediately

The following should be noted:

1. Once phase 1 has begun with *Stop Mode* (06.001) = 3 or 4 the stopping sequence must be completed or terminated by de-activating the Final drive disable or because the drive has tripped.
2. If *Stop Mode* (06.001) = 5 the drive can be disabled and re-enabled immediately if the Final drive run is de-activated to stop the drive. If the Final drive enable is used to stop the drive then there is a 1s delay before the drive can be re-enabled.

Parameter	06.003 Supply Loss Mode		
Short description	Defines the behaviour of the drive when the supply voltage is reduced		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disable
1	Ramp Stop
2	Ride Thru

If *Supply Loss Mode* (06.003) > 0 and the *D.c. Bus Voltage* (05.005) falls below *Supply Loss Detection Level* (06.048) - 0.05 x VM_SUPPLY_LOSS_LEVEL[MIN] then the supply loss condition is detected and *Supply Loss* (10.015) = 1. If the supply subsequently rises above *Supply Loss Detection Level* (06.048) + 0.05 x VM_SUPPLY_LOSS_LEVEL[MIN] then the supply loss condition is no longer active and *Supply Loss* (10.015) = 0.

0: Disable

No supply loss detection is provided by monitoring the *D.c. Bus Voltage* (05.005). The drive will continue to operate normally unless the under voltage condition is detected.

1: Ramp Stop

The action taken by the drive is the same as for ride through mode, except that the ramp down rate is at least as fast as the currently selected deceleration ramp and the drive will continue to decelerate and stop even if the supply is re-applied. If *Stop Mode* (06.001) = 3 or 4 (i.e. d.c. injection) the drive will use ramp mode to stop on loss of the supply. If *Stop Mode* (06.001) = 2 (i.e. ramp stop followed by injection) the drive will ramp to a stop and then attempt to apply d.c. injection. Once the sequencer state machine has reached the DISABLE state, it will be necessary to disable and re-enable the drive for it to run again because bit 2 of *Enable Conditions* (06.010) is set when the sequencer state machine changes from the DECELERATION state.

2: Ride through

The drive attempts to control the d.c. link voltage to take energy from the motor and load inertia to ride through the Supply loss condition for as long as possible.

Parameter	06.006 Injection Braking Level		
Short description	Defines the level of current used for injection braking		
Mode	Open-Loop		
Minimum	0.0	Maximum	150.0
Default	100.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, RA		

Injection Braking Level (06.006) defines the level of current used for injection braking as a percentage of *Rated Current* (05.007). It should be noted that if detection of low speed is required (i.e. *Stop Mode* (06.001) = 3) low speed detection may not be detected if *Injection Braking Level* (06.006) is set to a low level. For detection of low speed it is recommended that *Injection Braking Level* (06.006) is 50% or more.

Parameter	06.007 Injection Braking Time		
Short description	Defines the time during which d.c. current is injected into the motor during stopping with injection stopping modes		
Mode	Open-Loop		
Minimum	0.0	Maximum	100.0
Default	1.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Injection Braking Time (06.007) defines the time during which d.c. current is injected into the motor during stopping with injection stopping modes. See *Stop Mode* (06.001).

Parameter	06.008 Hold Zero Speed		
Short description	Set to 1 to hold the motor at zero speed		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Hold Zero Speed* (06.008) = 0 the sequencer state machine goes to the DISABLE state and the inverter is disabled when the Final drive run is de-activated and the motor reaches standstill.

If *Hold Zero Speed* (06.008) = 1 and *Motor Pre-heat Current Magnitude* (06.052) = 0% the sequencer state machine goes to the STOP state when the Final drive run is de-activated and the motor reaches standstill. The drive remains enabled with a frequency or speed reference of zero. If *Motor Pre-heat Current Magnitude* (06.052) is set to a non-zero value it defines the current in the motor when the sequencer state machine is in the STOP state. This is intended for applications where there is no motor load at standstill, but motor current is required to prevent condensation in the motor when it is stopped. If the motor is not force cooled the motor cooling is less effective at standstill than when the motor is rotating, and so care should be taken not to damage the motor by leaving it at standstill for prolonged periods with a high level of current.

Parameter	06.009 Catch A Spinning Motor		
Short description	Defines the behaviour of the drive when the drive is enabled whilst the motor is not at zero speed		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disable
1	Enable
2	Fwd Only
3	Rev Only

If *Catch A Spinning Motor* (06.009) = 0 then the *Post Ramp Reference* (02.001) is set to zero when the drive is started. This is suitable for applications where the motor is at standstill or rotating at a low speed when the drive is enabled.

If *Catch A Spinning Motor* (06.009) > 0 a test is carried out to measure the speed of the motor when the sequencer state machine enters the RUN state. The minimum time for the test is approximately 200ms, but this may be extended as time is allowed for the motor flux to build up. The measured speed is used to preset the *Post Ramp Reference* (02.001) and give a smooth start even if the motor is already spinning. The test is not carried out if the Final drive run is activated when the sequencer state machine is in the STOP state or if a stator resistance measurement is carried out when the drive is enabled (see *Open-loop Control Mode* (05.014)). For the test to be successful it is important that the motor parameters, and especially the *Stator Resistance* (05.017), are set up correctly even if fixed boost mode is selected with *Open-loop Control Mode* (05.014). Although it is unlikely, for larger motors it may also be necessary for *Spin Start Boost* (05.040) to be increased from its default value of 1.0.

Restrictions can be placed on the direction of movement and the possible direction of the detected frequency as given in the table below.

Catch A Spinning Motor (06.009)	Function
0	Catch a spinning motor disabled
1	Detect all possible frequencies
2	Detect positive frequencies only
3	Detect negative frequencies only

It should be noted that if fixed boost or square are selected with *Open-loop Control Mode* (05.014) it is possible for some movement to occur in the wrong direction even when the direction is disabled with *Catch A Spinning Motor* (06.009). It is recommended that the motor parameters including the stator resistance are set up initially using auto-tuning and then Ur mode is selected with *Open-loop Control Mode* (05.014) if the catch a spinning motor function is to be used. Alternatively Ur I mode can be selected which will only perform a stator resistance measurement when the drive is first enabled after power-up, and then a test to catch a spinning motor when the drive is subsequently enabled. However, for this to work correctly it is assumed the motor is stationary when the drive is first power-up.

Parameter	06.010 Enable Conditions		
Short description	Displays all the conditions needed to change the state of the final drive enable		
Mode	Open-Loop		
Minimum	0 (Display: 000000000000)	Maximum	4095 (Display: 111111111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	2ms write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

The Final drive enable is a combination of the *Hardware Enable* (06.029), *Drive Enable* (06.015) and other conditions that can prevent the drive from being enabled. All of these conditions are shown as bits in *Enable Conditions* (06.010) as given in the table below.

Enable Conditions (06.010) bits	Enable condition
0	<i>Hardware Enable</i> (06.029)
1	<i>Drive Enable</i> (06.015)
2	0 if auto-tune completed or trip during auto-tune, or if the drive stops when supply loss stop is active, but the drive needs to be disabled and re-enabled. (Always 1 in Regen mode).
3	1 if fire mode is active.
4	Zero if <i>Position Feedback Initialized</i> (03.076) is present and all devices are not indicated as initialised, otherwise one.
5	Zero until the drive thermal model has obtained temperatures from all drive thermistors at least once.
6	Zero until all option modules that are present in the drive have indicated that they are ready to run or the system has timed out waiting for this.
7-10	Zero if an option module has forced the drive to be disabled if for example it is updating its user program. Bit 7 corresponds to slot 1, bit 8 to slot 2, etc.
11	Zero if the drive is in standby mode. See <i>Standby Mode Enable</i> (06.060)

Parameter	06.011 Sequencer State Machine Inputs		
Short description	Displays the states of inputs into the sequencer state machine		
Mode	Open-Loop		
Minimum	0 (Display: 000000)	Maximum	63 (Display: 111111)
Default		Units	
Type	8 Bit Volatile	Update Rate	2ms write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The bits in *Sequencer State Machine Inputs* (06.011) show the state of the inputs to the sequencer state machine as given in the tables below.

Sequencer State Machine Inputs (06.011)	Signal	Indicates
0	Final drive enable	The drive inverter is allowed to be enabled.
1	Final drive run	The motor can move away from standstill.
2	<i>Under Voltage Active</i> (10.016)	The under voltage condition has been detected.
3	<i>Zero Speed</i> (10.003)	Indicated when the motor has stopped.
4	Drive tripped	The drive is tripped.
5	<i>Supply Loss</i> (10.015)	Supply loss condition has been detected.

Parameter	06.012 Enable Stop Key		
Short description	Set to 1 to enable the use of the stop key		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

The Stop key can be used to stop the drive if *Enable Stop Key* (06.012) = 1 or *Reference Selected Indicator* (01.049) = 4. The Stop key is also used to reset the drive from the keypad. If *Enable Stop Key* (06.012) = 0 and *Reference Selected Indicator* (01.049) is not equal to 4 the Stop key is not active and can be used to initiate a drive reset and without stopping the drive from running. If *Enable Stop Key* (06.012) = 1 or *Reference Selected Indicator* (01.049) = 4 the drive reset can be initiated without stopping the drive by holding the Run key and then pressing the Stop key.

It should be noted that if the drive is tripped and is then reset from any source other than the keypad Stop key then the drive may start immediately under the following conditions:

Enable Sequencer Latching (06.040) = 0, the Final drive enable is active and one of the sequencer bits (*Run Forward* (06.030), *Run Reverse* (06.032) or *Run* (06.034) is active.

Enable Sequencer Latching (06.040) = 1, the Final drive enable is active, *Not Stop* (06.039) is active and one of the sequencer bits (*Run Forward* (06.030), *Run Reverse* (06.032) or *Run* (06.034) is active.

The drive sequencer has been designed so that pressing the Stop key, whatever the value of *Enable Stop Key* (06.012) or *Reference Selected Indicator* (01.049), does not make the drive state change from stopped to running. As pressing the Stop key could reset a drive trip which could then restart the drive, the run output from the sequencer is held off until the following conditions are met when the drive is tripped and the Stop key is pressed.

(*Run Forward* (06.030) = 0 and *Run Reverse* (06.032) = 0 and *Run* (06.034) = 0 and *Not Stop* (06.039) = 0*

OR (*Run Forward* (06.030) = 1 and *Run Reverse* (06.032) = 1 for at least 60ms*

OR The *Hardware Enable* (06.029) = 0 or software enable is zero+

OR The sequencer is in the UNDER_VOLTAGE state

**Not Stop* (06.039) is only used with latching logic (i.e. *Enable Sequencer Latching* (06.040) = 1). When latching logic is not used then *Not Stop* (06.039) is normally zero, and so it does not affect the conditions required to reapply the drive run.

+The software enable is either *Drive Enable* (06.015) or the enable from *Control Word* (06.042) as selected by *Control Word Enable* (06.043).

Once the necessary conditions have been met the drive can then be restarted by activating the necessary bits for a normal start.

Parameter	06.013 Enable Auxiliary Key		
Short description	Defines the behaviour of the drive when the auxiliary button is pressed		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Forward/Reverse
2	Run Reverse

If Hand/Off/Auto mode is active (see *Hand/Off/Auto Operating Mode* (01.052)) then *Enable Auxiliary Key* (06.013) has no effect. Otherwise if *Reference Selected Indicator* (01.049) = 4 then *Enable Auxiliary Key* (06.013) can be used to enable the Auxiliary key as a reverse key. If *Enable Auxiliary Key* (06.013) = 1 then each time the Auxiliary key is pressed *Reverse Select* (01.012) is toggled. If *Enable Auxiliary Key* (06.013) = 2 then the Auxiliary key behaves in a similar way to the Run key except that the drive runs in the reverse direction when it is pressed.

Parameter	06.015 Drive Enable		
Short description	Set to 1 to enable the drive		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Drive Enable (06.015) must be active for the drive to be enabled. See description of enable logic.

Parameter				06.016 Date			
Short description				Displays the current date			
Mode				Open-Loop			
Minimum		0 (Display: 00-00-00)		Maximum		311299 (Display: 31-12-99)	
Default				Units			
Type		32 Bit Volatile		Update Rate		Background read/write	
Display Format		Date		Decimal Places		0	
Coding				RW, ND, NC, PT			

Date (06.016), *Time* (06.017) and *Day Of Week* (06.018) show the date and time as selected by *Date/Time Selector* (06.019). *Date* (06.016) stores the date in dd.mm.yy format regardless of the setting made in *Date Format* (06.020) however if the parameter is viewed using a keypad the date will be displayed in the format selected in *Date Format* (06.020). If a real time clock is selected from an option module then the days, months and years are from the real time clock and the day of the week is displayed in *Day Of Week* (06.018). Otherwise the days have a minimum value of 0 and roll over after 30, the months have a minimum value of 0 and roll over after 11, and *Day Of Week* (06.018) is always 0 (Sunday).

If when setting the date/time this parameter is being written via comms or from an applications module then the value should be written in standard dd/mm/yy format as described below.

The value of this parameter as seen over comms or to an applications module is as follows.

Value = (day[1..31] x 10000) + (month[1..12] x 100) + year[0..99]

Parameter				06.017 Time			
Short description				Displays the current time			
Mode				Open-Loop			
Minimum		0 (Display: 00:00:00)		Maximum		235959 (Display: 23:59:59)	
Default				Units			
Type		32 Bit Volatile		Update Rate		Background read/write	
Display Format		Time		Decimal Places		0	
Coding				RW, ND, NC, PT			

See *Date* (06.016).

The value of this parameter as seen over comms or to an applications module is as follows.

Value = (hour[0..23] x 10000) + (minute[0..59] x 100) + seconds[0..59]

Parameter				06.018 Day Of Week			
Short description				Displays the current day of the week			
Mode				Open-Loop			
Minimum		0		Maximum		6	
Default				Units			
Type		8 Bit Volatile		Update Rate		Background write	
Display Format		Standard		Decimal Places		0	
Coding				RO, TE, ND, NC, PT			

Value	Text
0	Sunday
1	Monday
2	Tuesday
3	Wednesday
4	Thursday
5	Friday
6	Saturday

See *Date* (06.016).

Parameter				06.019 Date/Time Selector			
Short description				Defines which clock is used to display the current time, date and day of the week			
Mode				Open-Loop			
Minimum		0		Maximum		5	
Default				Units			
Type		8 Bit User Save		Update Rate		Background read	
Display Format		Standard		Decimal Places		0	
Coding				RW, TE			

Value	Text
0	Set
1	Powered
2	Running
3	Acc Powered
4	Local Keypad
5	Remote Keypad

Date/Time Selector (06.019) is used to select the drive date and time as shown in the table below.

Date/Time Selector (06.019)	Date/Time Source
0: Set	Date and time parameters can be written by the user.
1: Power	Time since the drive was powered up.
2: Running	Accumulated drive running time since the drive was manufactured.
3: Acc Power	Accumulated powered-up time since the drive was manufactured.
4: Local Keypad	If a keypad fitted to the front of the drive includes a real-time clock then the date/time from this clock is displayed, otherwise the date/time is set to zero.
5: Remote Keypad	If a keypad connected to the user comms port of a drive with a 485 includes a real-time clock then the date/time from this clock is displayed, otherwise the date/time is set to zero.

When *Date/Time Selector* (06.019) = 0 the *Date* (06.016) and *Time* (06.017) can be written by the user and the values in these parameters are transferred to the real time clocks in keypads that support this feature that are fitted to the drive. When *Date/Time Selector* (06.019) is changed to any other value, the real time clocks are allowed to run normally again. When *Date/Time Selector* (06.019) is changed from any value to 0 the date and time from a real time clock, if present, is automatically loaded into *Date* (06.016) and *Time* (06.017), so that this date and time is used as the initial value for editing. If more than one real time clock is present the date/time from the local keypad is used, if present.

Date (06.016) and *Time* (06.017) are used by the timers in Menu 09 and for time stamping trips. These features will continue to use the originally selected clock even if *Date/Time Selector* (06.019) is changed until a drive reset is initiated. If *Date/Time Selector* (06.019) has been changed and a reset is initiated *Timer 1 Repeat Function* (09.039) and *Timer 2 Repeat Function* (09.049) are set to zero to disable the timers, and the trip dates and times (10.041 to 10.060) are reset to zero.

Parameter	06.020 Date Format		
Short description	Defines if the US date format is used or not		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Std
1	US

Date Format (06.020) selects the display style for *Date* (06.016), *Timer 1 Start Date* (09.035), *Timer 1 Stop Date* (09.037), *Timer 2 Start Date* (09.045), *Timer 2 Stop Date* (09.047), and for the trip time stamping date parameters (10.041, 10.043, 10.045, 10.047, 10.049, 10.051, 10.053, 10.055, 10.057 and 10.059) when displayed on a keypad connected to the drive. The format selection made in this parameter does not affect the value of these parameters if they are read using comms or by an applications program.

If *Date Format* (06.020) is 0 then standard format is used and the date is displayed on the keypad as dd.mm.yy and if *Date Format* (06.020) is 1 then US format is used and the date is displayed on the keypad as mm.dd.yy.

Parameter	06.021 Time Between Filter Changes		
Short description	Defines the time between filter changes		
Mode	Open-Loop		
Minimum	0	Maximum	30000
Default	0	Units	Hours
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Time Between Filter Changes (06.021) should be set to a non-zero value to enable the filter change timer system. Each time *Filter Change Required / Change Done* (06.022) is changed by the user from 1 to 0 the value of *Time Between Filter Changes* (06.021) is copied to *Time Before Filter Change Due* (06.023). For each hour while *Drive Active* (10.002) = 1 the *Time Before Filter Change Due* (06.023) is reduced by 1 until it reaches zero. When *Time Before Filter Change Due* (06.023) reaches 0 *Filter Change Required / Change Done* (06.022) is set to 1 to indicate that a filter change is required. The filter should be changed and the system reset again by resetting *Filter Change Required / Change Done* (06.022) to 0.

When a non-zero value is written to *Time Between Filter Changes* (06.021) to enable the system, *Filter Change Required / Change Done* (06.022) should be set to 1 and then back to 0 to transfer the required time to *Time Before Filter Change Due* (06.023) and to enable the count down.

Parameter	06.022 Filter Change Required / Change Done		
Short description	Set to 0 when a filter change has taken place		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC		

See *Time Between Filter Changes* (06.021).

Parameter	06.023 Time Before Filter Change Due		
Short description	Displays the time before a filter change is required		
Mode	Open-Loop		
Minimum	0	Maximum	30000
Default		Units	Hours
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Time Between Filter Changes* (06.021).

Parameter	06.024 Reset Energy Meter		
Short description	Set to 1 to reset the energy meter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Energy Meter: MWh (06.025) and *Energy Meter: kWh* (06.026) accumulate the energy transferred through the drive. A positive energy value indicates net transfer of energy from the drive to the motor. If *Reset Energy Meter* (06.024) = 1 then *Energy Meter: MWh* (06.025) and *Energy Meter: kWh* (06.026) are held at zero. If *Reset Energy Meter* (06.024) = 0 then the energy meter is enabled and will accumulate the energy flow. If the maximum or minimum of *Energy Meter: MWh* (06.025) is reached the parameter does not rollover and is instead clamped at the maximum or minimum value.

Parameter	06.025 Energy Meter: MWh		
Short description	Displays the energy accumulated by through the drive in MWh		
Mode	Open-Loop		
Minimum	-999.9	Maximum	999.9
Default		Units	MWh
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

See *Reset Energy Meter* (06.024).

Parameter	06.026 Energy Meter: kWh		
Short description	Displays the energy accumulated by through the drive in kWh		
Mode	Open-Loop		
Minimum	-99.99	Maximum	99.99
Default		Units	kWh
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *Reset Energy Meter* (06.024).

Parameter	06.027 Energy Cost Per kWh		
Short description	Defines the cost of energy per kWh		
Mode	Open-Loop		
Minimum	0.0	Maximum	600.0
Default	0.0	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Running Cost (06.028) is derived from the *Output Power* (05.003) and the *Energy Cost Per kWh* (06.027) in cost per hour. The sign of *Running Cost* (06.028) is the same as the sign of *Output Power* (05.003).

Parameter	06.028 Running Cost		
Short description	Displays the running cost of the drive		
Mode	Open-Loop		
Minimum	-32000	Maximum	32000
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Energy Cost Per kWh* (06.027).

Parameter	06.029 Hardware Enable		
Short description	Set to 1 to enable the hardware of the drive		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Hardware Enable (06.029) normally shows the hardware enable state based on the state of the safe torque off system. However, drive I/O can be routed to *Hardware Enable* (06.029) to reduce the disable time. See description of the enable logic for more details.

Parameter	06.030 Run Forward		
Short description	Set to 1 to give the drive a run forward signal		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Reference Selected Indicator* (01.049) is not equal to 4 then *Run Forward* (06.030) can be used to make the Final drive run active and *Reverse Select* (01.012) = 0, i.e. to make the drive run in the forward direction. See description of sequencer logic for more details.

Parameter	06.031 Jog		
Short description	Set to 1 to give the drive a jog signal		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Reference Selected Indicator* (01.049) is not equal to 4 then *Jog* (06.031) can be used to make the Final drive run active and *Jog Select* (01.013) = 1, i.e. to make the drive run using the jog reference and jog ramps rates. The jog function is disabled if the run is made active through the normal running sequencing bits. See description of sequencer logic for more details.

Parameter	06.032 Run Reverse		
Short description	Set to 1 to give the drive a run reverse signal		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Reference Selected Indicator* (01.049) is not equal to 4 then *Run Reverse* (06.032) can be used to make the Final drive run active and *Reverse Select* (01.012) = 1, i.e. to make the drive run in the reverse direction. See description of sequencer logic for more details.

Parameter	06.033 Forward/Reverse		
Short description	Set to 1 to reverse the direction of the motor		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Reference Selected Indicator* (01.049) is not equal to 4 then *Forward/Reverse* (06.033) can be used to force the state of *Reverse Select* (01.012). If *Forward/Reverse* (06.033) = 1 then *Reverse Select* (01.012) = 1. If *Forward/Reverse* (06.033) = 0 then *Forward/Reverse* (06.033) = 0 unless it is set to 1 by the rest of the normal run or jog logic. See description of sequencer logic for more details.

Parameter				06.034 Run			
Short description				Set to 1 to give the drive a run signal			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default		0		Units			
Type		1 Bit Volatile		Update Rate		2ms read	
Display Format		Standard		Decimal Places		0	
Coding				RW, NC			

If *Reference Selected Indicator* (01.049) is not equal to 4 then *Run* (06.034) can be used to make the Final drive run active, but not to affect the state of *Reverse Select* (01.012). Normally *Run* (06.034) would be used in conjunction with *Forward/Reverse* (06.033) if control of the direction is required. See description of sequencer logic for more details.

Parameter				06.035 Forward Limit Switch			
Short description				Set to 1 to activate the forward limit switch and remove the final drive run signal			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default		0		Units			
Type		1 Bit Volatile		Update Rate		2ms or 250µs read	
Display Format		Standard		Decimal Places		0	
Coding				RW, NC			

Forward Limit Switch (06.035) and *Reverse Limit Switch* (06.036) can be used to activate the Limit switch active signal and remove the Final drive run signal. See description of sequencer logic for more details.

Normally digital input destinations are routed to *Forward Limit Switch* (06.035) and *Reverse Limit Switch* (06.036) to activate the limit switch system. If a digital input that is integral to the drive is used then Limit switch active will follow the state of the input with a maximum delay of approximately 2.5ms. If *Limit Switch Active* (10.066) becomes active the motor is stopped using the currently selected ramp rate. The limit switches are direction dependant as shown below, so that the motor can rotate in a direction that allows the system to move away from the limit switch.

Condition	<i>Forward Limit Switch</i> (06.035)	<i>Reverse Limit Switch</i> (06.036)
<i>Pre-ramp Reference</i> (01.003) > 0.0	Active	Not active
<i>Pre-ramp Reference</i> (01.003)	Not active	Active
<i>Pre-ramp Reference</i> (01.003) = 0.0	Active	Active
<i>Enable Frequency Slaving</i> (03.013) = 1	Active	Active

Parameter				06.036 Reverse Limit Switch			
Short description				Set to 1 to activate the reverse limit switch and remove the final drive run signal			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default		0		Units			
Type		1 Bit Volatile		Update Rate		2ms or 250µs read	
Display Format		Standard		Decimal Places		0	
Coding				RW, NC			

See *Forward Limit Switch* (06.035).

Parameter				06.037 Jog Reverse			
Short description				Set to 1 to give the drive a jog reverse signal			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default		0		Units			
Type		1 Bit Volatile		Update Rate		2ms read	
Display Format		Standard		Decimal Places		0	
Coding				RW, NC			

If *Reference Selected Indicator* (01.049) is not equal to 4 then *Jog Reverse* (06.037) can be used to make the Final drive run active, *Jog Select* (01.013) = 1 and *Reverse Select* (01.012) = 1, i.e. to make the drive run using the jog reference and jog ramps rates in the reverse direction. The jog function is disabled if the run is made active through the normal running sequencing bits. See description of sequencer logic for more details.

Parameter	06.039 <i>Not Stop</i>		
Short description	Set to 1 to reset the latched sequencer bits if sequencer latching is enabled		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Enable Sequencer Latching* (06.040) = 1 then the sequencer bits can be latched. *Not Stop* (06.039) should be used to reset the latched sequencer bits. If *Not Stop* (06.039) = 1 then the sequencer bits can be latched. If *Not Stop* (06.039) = 0 then the latches are cleared and their outputs are forced to zero which will de-activate the Final drive run. See description of sequencer logic for more details.

Parameter	06.040 <i>Enable Sequencer Latching</i>		
Short description	Set to 1 to enable sequencer latching		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Not Stop* (06.039).

Parameter	06.041 <i>Drive Event Flags</i>		
Short description	Displays if certain actions have occurred within the drive		
Mode	Open-Loop		
Minimum	0 (Display: 00)	Maximum	3 (Display: 11)
Default	0 (Display: 00)	Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RW, NC		

Drive Event Flags (06.041) indicates that certain actions have occurred within the drive as described below.

Bit	Corresponding event
0	Defaults loaded
1	Drive mode changed

Bit 0: Defaults loaded

The drive sets bit 0 when defaults have been loaded and the associated parameter save has been completed. The drive does not reset this flag except at power-up.

Bit 1: Drive mode changed

The drive sets bit 1 when the drive mode has changed and the associated parameter save has been completed. The drive does not reset this flag except at power-up.

Parameter	06.042 <i>Control Word</i>		
Short description	Controls the sequencer state machine inputs if the control word is enabled		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000000000)	Maximum	32767 (Display: 1111111111111111)
Default	0 (Display: 0000000000000000)	Units	
Type	16 Bit Volatile	Update Rate	Bits 9,7-0: 2ms read. Other bits: Background read
Display Format	Binary	Decimal Places	0
Coding	RW, NC		

If *Control Word Enable* (06.043) = 0 then *Control Word* (06.042) has no effect. If *Control Word Enable* (06.043) = 1 the bits in *Control Word* (06.042) are used instead of their corresponding parameters or to initiate drive functions as shown in the table below.

Bit	Corresponding parameter or function
0	<i>Drive Enable</i> (06.015)
1	<i>Run Forward</i> (06.030)
2	<i>Jog</i> (06.031)
3	<i>Run Reverse</i> (06.032)
4	<i>Forward/Reverse</i> (06.033)
5	<i>Run</i> (06.034)
6	<i>Not Stop</i> (06.039)
7	Auto/manual
8	Analogue/Preset reference
9	<i>Jog Reverse</i> (06.037)
10	Not used
11	Not used
12	Trip drive
13	<i>Drive Reset</i> (10.033)
14	Watchdog

Bits 0-7 and bit 9: Sequencer control

When Auto/manual bit (bit7) = 1 then bits 0 to 6 and bit 9 of the *Control Word* (06.042) become active. The equivalent parameters are not modified by these bits, but become inactive when the equivalent bits in the *Control Word* (06.042) are active. When the bits are active they replace the functions of the equivalent parameters.

Bit 8: Analogue/preset reference

The state of Analogue/Preset Reference (bit 8) is written continuously to *Reference Select Flag 2* (01.042). With default drive settings (i.e. *Reference Selector* (01.014) = 0) this selects *Analog Reference 1* (01.036) when bit 8 = 0 or *Preset Reference 1* (01.021) when bit8 = 1. If any other drive parameters are routed to *Reference Select Flag 2* (01.042) the value of this parameter is undefined.

Bit 10 and bit 11: Not used

The values of these bits have no effect on the drive.

Bit 12: Trip drive

If bit 12 = 1 then a *Control Word* trip is repeatedly initiated. The trip cannot be cleared until bit 12 = 0.

Bit 13: Reset drive

If bit 13 is changed from 0 to 1 a drive reset is initiated. Bit 13 does not modify *Drive Reset* (10.033).

Bit 14: Watchdog

A watchdog system can be enabled or serviced each time bit 14 is changed from 0 to 1. Once bit 14 has been changed from 0 to 1 to enable the watchdog, this must be repeated every 1s or else a *Watchdog* trip will be initiated. The watchdog is disabled when the trip occurs and must be re-enabled if required when the trip is reset.

Parameter	06.043 Control Word Enable		
Short description	Set to 1 to enable the control word		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	2ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Control Word* (06.042).

Parameter	06.044 Active Supply		
Short description	Indicates when the backup supply mode is enabled and the dc link voltage is below the upper under voltage threshold		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

If *Backup Supply Mode Enable* (06.068) = 0 then *Active Supply* (06.044) = 0. If *Backup Supply Mode Enable* (06.068) = 1 then *Active Supply* (06.044) = 0 when the d.c. link voltage is above the upper under-voltage threshold otherwise it is one. In Regen mode *Active Supply* (06.044) is always zero.

Parameter	06.045 Cooling Fan control		
Short description	Defines the maximum speed of the drive cooling fan		
Mode	Open-Loop		
Minimum	-10	Maximum	11
Default	-10	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Cooling Fan control (06.045) can be used to select various fan control functions as shown in the table below. The actual control speed of the fan(s) is given in *Cooling Fan Speed* (06.046). There are 10 control speeds for the fan(s) in the drive, however the actual hardware control is more coarse than this, and so there may not be an actual change of fan speed as *Cooling Fan Speed* (06.046) changes from one value to the next. The default value for *Cooling Fan control* (06.045) is 10, which gives maximum cooling and does not limit the fan speed below its maximum. It should be noted that if the speed is limited, by setting a lower value, then the drive may trip prematurely under load.

<i>Cooling Fan control</i> (06.045)	Function Selected
-10 to -1	Minimum fan noise function with fan speed limited to the value of <i>Cooling Fan control</i> (06.045).
0	Fan does not run.
1 to 10	Maximum cooling with fan speed limited to the modulus of <i>Cooling Fan control</i> (06.045).
11	Fan runs continuously at full speed.

The two possible control characteristics are shown in the diagram below.

The fan speed is derived from *Percentage Of Drive Thermal Trip Level* (07.036) which shows the percentage to the trip level of the hottest monitored point in the drive. The "Maximum Cooling" characteristic brings the fan(s) on at a relatively low temperature to give maximum cooling. The "Minimum Fan Noise" characteristic does not switch on the fan(s) until the drive temperature has risen significantly, and the characteristic has a lower gradient. Therefore with lighter continuous loads the fan noise is kept to a minimum. This characteristic also prevents the fan(s) from coming on when the drive is disabled and operating in a high ambient. With both characteristics a filter is applied to *Percentage Of Drive Thermal Trip Level* (07.036) to avoid the fans switching on and off during short high transient loads. The "Minimum Fan Noise" characteristic also includes a hysteresis band of 15% that is applied to the percentage of drive thermal trip level at the input to the control algorithm to prevent the feedback from changing the speed back again. This reduces the chance of the fan repetitively changing speed under constant load conditions.

Parameter	06.046 Cooling Fan Speed		
Short description	Cooling Fan Speed		
Mode	Open-Loop		
Minimum	0	Maximum	10
Default		Units	
Type	8 Bit Volatile	Update Rate	Background Write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Cooling Fan control* (06.045).

Parameter	06.047 Input Phase Loss Detection Mode		
Short description	Defines how the input phase loss is detected		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Full
1	Ripple Only
2	Disabled

Input phase loss is detected by monitoring the d.c. link voltage ripple which increases with load. When compared to normal operation, if an input phase is missing or there is excessive input phase imbalance the d.c. link the ripple level is higher. For frame sizes 07 and above additional input phase loss detection is provided by direct monitoring of the supply voltages. Unlike the d.c. voltage ripple based detection which can only operate when the drive is enabled and on load, the additional input phase loss detection can operate whether the drive is enabled or not. *Input Phase Loss Detection Mode* (06.047) defines the methods used for input phase loss detection provided by the drive.

Input Phase Loss Detection Mode (06.047)	Drive Active (10.002) = 0	Drive Active (10.002) = 1
0	*Direct input phase loss detection	*Direct input phase loss detection D.c. link voltage ripple detection
1	No input phase loss detection	D.c. link voltage ripple detection
2	No input phase loss detection	No input phase loss detection

*Frame sizes 07 and above

Input phase loss detection can be disabled when the drive is required to operate from a d.c. supply connected to the d.c. link or from a single phase supply. If the drive operates from a single phase supply or a supply with high levels of phase imbalanced under load the input stage and d.c. link thermal protection system may produce an *Oht dc bus* trip.

When frame sizes 10 and above are operated with parallel power modules a trip is initiated if the supply is completely removed from the input to any of the parallel modules. This additional detection is disabled if *Input Phase Loss Detection Mode* (06.047) > 0.

Parameter	06.048 Supply Loss Detection Level		
Short description	Defines the threshold for indicating when the supply loss condition is detected		
Mode	Open-Loop		
Minimum	-VM_SUPPLY_LOSS_LEVEL	Maximum	VM_SUPPLY_LOSS_LEVEL
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Default Value
200V	205
400V	410
575V	540
690V	540

See *Supply Loss Mode* (06.003).

Parameter	06.051 Hold Supply Loss Active		
Short description	Hold Supply Loss Active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	2ms Read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If supply loss is detected (i.e. *Supply Loss* (10.015) = 1) or *Hold Supply Loss Active* (06.051) = 1 the supply loss indication and the action taken on supply loss will be active. For example, *Hold Supply Loss Active* (06.051) can be controlled by an external rectifier or a Regen system (via a digital input) to prevent power from being taken from the supply if supply loss ride-through mode is being used until the input system is ready to provide power. For example, this can allow a charge system in an external rectifier to complete the charging of the d.c. link and become inactive before power is taken from the supply. A Regen system connected between the supply and the drive can operate in auto-synchronisation mode for a short time when the supply is removed. *Hold Supply Loss Active* (06.051) can be used to make the supply loss state persist for a short time after the supply is reapplied while the Regen system recovers. See *Disable Charge System / Close Contactor* (03.007) for more details.

Parameter	06.052 Motor Pre-heat Current Magnitude		
Short description	Defines the current in the motor when the state machine is in the stop state		
Mode	Open-Loop		
Minimum	0	Maximum	100
Default	0	Units	%
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Hold Zero Speed* (06.008).

Parameter	06.058 Output Phase Loss Detection Time		
Short description	Output Phase Loss Detection Time		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	0.5s
1	1.0s
2	2.0s
3	4.0s

See *Output Phase Loss Detection Enable* (06.059). This parameter has no effect in RFC-S mode.

Parameter	06.059 Output Phase Loss Detection Enable		
Short description	Set to non-zero value to enable output phase loss detection		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Phases
2	Devices

Output phase loss detection can be used to detect a disconnected motor phase or a failed power device if *Output Phase Loss Detection Enable* (06.059) is set to a non-zero value.

0: Disabled

Output phase loss detection is not active.

1: Phases

A test is carried out each time the drive is enabled to run to check if all three phases are connected. If the test fails an *Out Phase Loss.X* trip is initiated where X indicates which phase is not connected (1 = U, 2 = V, 3 = W). It should be noted that this test is not carried out in Open-loop mode if "catch a spinning motor" is enabled (i.e. *Catch A Spinning Motor* (06.009) > 0). A test is also carried out while the drive is running. If the drive output frequency is above 4Hz and a phase is disconnected for the time specified by *Output Phase Loss Detection Time* (06.058) then a *Out Phase Loss.4* trip is initiated. It should be noted that if the motor is operating at high speed and flux weakening is active so that the magnetising current is below half the rated level then output phase loss will not be detected. If the motor is heavily loaded when a phase is disconnected it is likely that the motor will stall and the drive output frequency may fall below 4Hz before output phase loss is detected.

2: Devices

This test is similar to the "Phases" test above except that additional tests are carried out when the drive is enabled to run which can detect if either the positive or negative power device has failed in each phase. If a phase is disconnected or the positive power device has failed then an *Out Phase Loss.X* trip is initiated where X is between 1 and 3 and indicates the phase that is not connected or has a failed positive device (1 = U, 2 = V, 3 = W). If X is between 5 and 7 it indicates that the negative power device in a phase has failed (5 = U, 6 = V, 7 = W).

The "Phases" test requires that 1/2 rated motor current flows to indicate that the phase is connected. The "Devices" test only requires 1/8 of rated current, and so it produces much less acoustic noise on starting. In either mode the tests take approximately 50ms. The "Devices" test is the preferred test as it tests all the power devices and produces less acoustic noise. The "Phases" test is provided for legacy reasons.

Parameter	06.060 Standby Mode Enable		
Short description	Set to 1 enable standby mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Standby Mode Enable* (06.060) = 1 then the drive will go into the standby power state whenever *Drive Active* (10.002) = 0 with a delay of 30s. In this state the LED on the front of the drive flashes 0.5s on and 5s off, the drive cannot be enabled and the following actions are taken as defined by the *Standby Mode Mask* (06.061). Actions are enabled by setting the appropriate bit to 1. Once standby mode has become active it will remain active, even if an attempt is made subsequently to enable the drive, until *Standby Mode Enable* (06.060) is set to 0.

Standby Mode Mask (06.061) bits	Action
0	Turn off the drive position feedback power supply. On leaving standby mode the drive position feedback interfaces will be re-initialised.
1	Turn off the power supply to a keypad fitted to the drive.
2	Turn off the drive 24V output.
3	Request that the option module in option slot 1 to go into the standby power mode
4	Request that the option module in option slot 2 to go into the standby power mode
5	Request that the option module in option slot 3 to go into the standby power mode
6	Request that the option module in option slot 4 to go into the standby power mode

Parameter	06.061 Standby Mode Mask		
Short description	Defines the actions of the drive with standby mode is enabled

Coding	RW, VM, RA		

Voltage	Region	Default Value
200V	All	230
200V	60Hz	248
400V	50Hz	330
400V	All	375
400V	60Hz	490
575V	All	435
690V	All	435

Under-voltage and power supply control

Under-voltage system

The under-voltage system controls the state of *Under Voltage Active* (10.016) which is then used by the sequencer state machine. Normally one detector is used to detect when the under-voltage state is active, unless back-up mode is being used with smaller drives (see below). The detector(s) include 5% hysteresis subject to a minimum of 5V. If *D.c. Bus Voltage* (05.005) is below the threshold *Under Voltage Active* (10.016) = 0. If *D.c. Bus Voltage* (05.005) is above the threshold, but below the threshold plus the 5% hysteresis there is no change of state. If *D.c. Bus Voltage* (05.005) is above the threshold plus 5% hysteresis *Under Voltage Active* (10.016) changes to one with a delay of 250ms. The delay is provided to allow the d.c. link voltage to stop rising before the charging system is disabled.

When *Under Voltage Active* (10.016) = 1 the sequencer state machine will change to the UNDER_VOLTAGE state and when the UNDER_VOLTAGE state is active it is not possible to enable the drive inverter. The under-voltage system operates in different ways depending on the setting of *Backup Supply Mode Enable* (06.068).

If the low under-voltage threshold is used or if back-up supply mode is selected the internal drive power supplies are normally powered from the 24V supply input (i.e. Digital I/O 13). See *User Supply Select* (06.072) for details. (It should be noted that in Regen mode *Backup Supply Mode Enable* (06.068) is not present, and so back-up supply mode cannot be selected.)

Drive frame sizes 06 and below use a charging system based on a charge resistor and shorting relay. For larger drive frame sizes a thyristor based charge system is used. The type of charge system does not alter the operation of the drive except for the times allowed for soft-start state changes and the method used for back-up supply mode. The setting for the under-voltage level is used to detect the under-voltage condition based on the d.c. link voltage. If a thyristor charging system is used this level is also passed to the thyristor rectifier system so that it is fully deactivated (i.e. the thyristors are phased forwards so that the drive can take power from the supply) by the time the d.c. link voltage reaches the under-voltage level and allows the drive inverter to become active. It should be noted that the under-voltage threshold used with a thyristor based charge system and the charging rate (*Slow Rectifier Charge Rate Enable* (06.071)) are automatically saved within the rectifier units each time the value is changed because these will be required at the next power-up before the drive control system is active. These values will be retained when they are changed 128 times. If any more changes are made between power-up and power-down the new values are not retained.

Standard mode: *Backup Supply Mode Enable* (06.068) = 0

If *Low Under Voltage Threshold Select* (06.067) = 0 then the under voltage threshold is defined by *Standard Under Voltage Threshold* (06.065). If *Low Under Voltage Threshold Select* (06.067) = 1 then the under voltage threshold is defined by *Low Under Voltage Threshold* (06.066). For drives which have a d.c. link charge system based on a charge resistor and shorting contactor, the charge system is normally active (contactor open) when *Under Voltage Active* (10.016) = 1, and inactive when *Under Voltage Active* (10.016) = 0. The exception is that there is a delay of 50ms while the contactor changes state and during these periods *Under Voltage Active* (10.016) = 1.

If the d.c. link voltage is above the under-voltage threshold and *Under Voltage Active* (10.016) = 0 a large surge of current can occur if the a.c. supply is removed and then reapplied to the drive. For a given level of supply voltage the worst case surge occurs when the supply is applied at the point where one of the line voltages is at its peak. The surge is proportional to the difference between the d.c. link voltage before the supply is reconnected and the magnitude of the supply voltage. The minimum setting and default for *Standard Under Voltage Threshold* (06.065) corresponds to the lowest d.c. link voltage level where the maximum allowed a.c. supply voltage can be applied without damaging the drive or rupturing the recommended supply fuses. Therefore it is safe to adjust the under-voltage threshold using the *Standard Under Voltage Threshold* (06.065). If the under-voltage threshold needs to be lower than the minimum of *Standard Under Voltage Threshold* (06.065), then the *Low Under Voltage Threshold* (06.066) should be used. It is important that the difference between the under-voltage threshold level and the peak of the supply voltage is never larger than the difference between the minimum *Standard Under Voltage Threshold* (06.065) and the peak of the maximum allowed a.c. supply voltage for the drive. For example:

The minimum *Standard Under Voltage Threshold* (06.065) for a 400V drive is 330V

The maximum allowed supply voltage for this drive is 480V + 10%

The peak of the maximum allowed supply voltage = $480 \times 1.1 \times \sqrt{2} = 747V$

The difference between the under-voltage threshold and the peak supply voltage = $747 - 330 = 417V$

Therefore for this drive voltage rating the peak line to line voltage must never be higher than *Low Under Voltage Threshold* (06.066) + 417V.

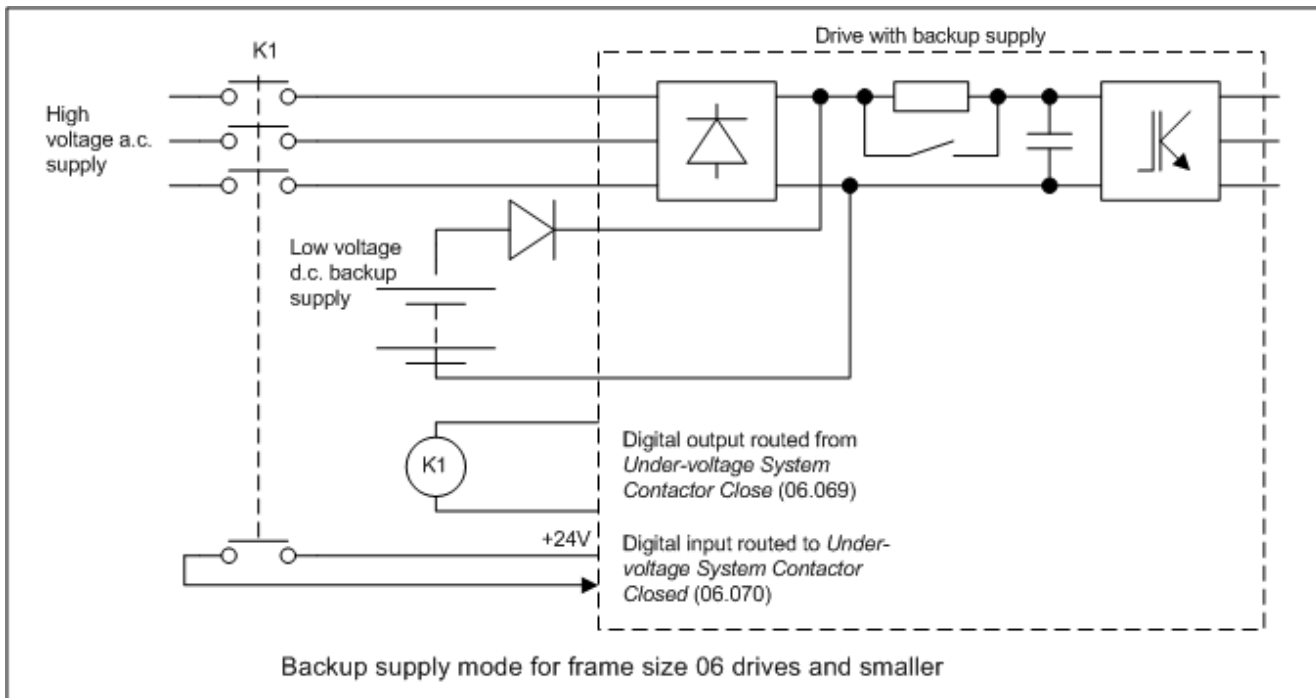

If *Low Under Voltage Threshold Select* (06.067) is set to one and *Low Under Voltage Threshold* (06.066) is reduced below the variable maximum level VM_STD_UNDER_VOLTAGE[MIN], or if *Backup Supply Mode Enable* (06.068) is set to one, an indication is stored in *Potential Drive Damage Conditions* (10.106) that cannot be cleared by the user. This marks the drive, so that if it is damaged as a result of an input current surge, this can be detected by service personnel.

For frame size 07 drives and larger, which use a d.c. link charge system based on a half controlled thyristor input bridge, the charge system is activated based on the level of the voltage at the a.c. supply terminals of the drive. The threshold for the charge system is set so that the rectified supply will give the required under-voltage threshold level. The under-voltage system operates in exactly the same way as for smaller drives except that the delay during the transition out of the under-voltage state is extended. For single power module drive the delay is 1.0s to allow the thyristor charge system to charge the d.c. link. For parallel power modules the delay is extended to 2.5s to ensure that all modules power up correctly.

Backup Supply Mode for frame size 06 drives and smaller: Backup Supply Mode Enable (06.068) = 1

Backup supply mode is intended to provide a smooth transition, without disabling the drive, from a high voltage a.c. supply to a low voltage d.c. backup supply. It is necessary to disable the drive for the transition back to the high voltage a.c. supply. The following diagram is a simple representation of the power circuit required. This does not include the necessary circuit protection components or possible battery charger, etc.

The diagram below shows the state of *Under Voltage Active* (10.016), the control signal to the external contactor (*Under-voltage System Contactor Close* (06.069)) and *Active Supply* (06.044). When *Backup Supply Mode Enable* (06.068) is set to one the maximum applied to *Low Under Voltage Threshold* (06.066) prevents this from being increased above *Standard Under Voltage Threshold* (06.065) / 1.1 so that the 5% hysteresis band on the low under-voltage threshold does not overlap the standard under-voltage threshold.

The numbers below correspond to the numbers shown in the diagram:

1. If the *D.c. Bus Voltage* (05.005) is below the Lower Threshold the drive is in the under-voltage state and the internal charge system is active to limit the charging current either from the low voltage d.c. backup supply or the high voltage a.c. supply. *Under-voltage System Contactor Close* (06.069) = 1, and so it is possible for the high voltage a.c. supply to charge the d.c. link.
2. If the *D.c. Bus Voltage* (05.005) is above the Lower Threshold, but below the Upper Threshold, there are two possible states depending on whether the Final drive enable is 0 or 1. If Final drive enable = 0 then *Under Voltage Active* (10.016) = 1, the internal charge system is active and *Under-voltage System Contactor Close* (06.069) = 1, so that the d.c. link can be charged by the high voltage a.c. supply. If Final drive enable = 1 then *Under Voltage Active* (10.016) = 0 and the internal charge system is inactive so that the drive can run from the low voltage d.c. backup supply. *Under-voltage System Contactor Close* (06.069) = 0, so that it is not possible for the high voltage a.c. supply to charge the d.c. link.
3. If the *D.c. Bus Voltage* (05.005) is above the Upper Threshold then *Under Voltage Active* (10.016) = 0 and *Under-voltage System Contactor Close* (06.069) = 1, so the drive can run from the high voltage a.c. supply.
4. If the *D.c. Bus Voltage* (05.005) subsequently falls below the Upper Threshold and the Final drive enable = 1, the drive can continue to run, but *Under-voltage System Contactor Close* (06.069) is set to zero to open the high voltage a.c. supply. The d.c. link voltage will fall until it reaches the low voltage d.c. backup supply level. This gives a smooth changeover to the backup supply without stopping the motor.

To ensure that the soft-start is in the correct state to protect the drive the following additional restrictions are applied:

1. The soft-start cannot change to the inactive state (i.e. internal soft-start relay closed) unless the d.c. link voltage is above the upper under-voltage threshold or *Under-voltage System Contactor Closed* (06.070) = 0. This is shown in the diagram below which shows the drive operation when the d.c. link voltage is between the upper and lower thresholds. When the Final Drive Enable becomes active the external contactor is opened to disconnect the supply because the drive is intended to run from the back-up supply. The soft-start should not be deactivated until the external contactor is opened because it is providing protection against surge currents due to the supply being reapplied. Once it is open the soft-start is deactivated (relay closed) and the drive can run. A side effect of this additional condition occurs when the d.c. link voltage falls and crosses the upper threshold when the drive is running. There should be a smooth transition, but the delay between disabling the external contactor (*Under-voltage System Contactor Close* (06.069) = 0) and confirmation of this (*Under-voltage System Contactor Closed* (06.070) = 0) when the d.c. link voltage crosses the threshold will cause the soft-start to activate transiently giving a period with under-voltage active. To prevent this problem the indication that the d.c. link voltage has fallen and crossed the upper threshold is delayed by 200ms.
2. *Under-voltage System Contactor Close* (06.069) is not set to one until the soft-start is fully active (relay open) because the soft-start is required to prevent current surges from the supply being applied. This is also shown in the diagram below.

Backup Supply Mode for frame size 07 drives and larger: (Backup Supply Mode Enable (06.068) = 1)

Backup supply mode is intended to provide a smooth transition, without disabling the drive, from a high voltage a.c. supply to a low voltage d.c. backup supply and vice versa. The following diagram is a simple representation of the power circuit required. This does not include the necessary circuit protection components or possible battery charger, etc.

The diagram below shows the state of Under Voltage Active (10.016) and the control signal to the external contactor (Under-voltage System Contactor Close (06.069)).

The backup supply system contactor is used to provide the charge system for the low voltage d.c. backup supply. The charge system for the high voltage a.c. supply is provided by the half controlled thyristor input bridge within the drive. The system operates in a similar way to standard mode (i.e. back-up mode not enabled) with the following differences.

1. The thyristor charge system always uses a threshold voltage related to the upper under-voltage threshold.
2. *Under-voltage System Contactor Close* (06.069) is set to one when the d.c. link voltage is above the lower under-voltage threshold.
3. *Under Voltage Active* (10.016) cannot be zero to allow the drive to be enabled if *Under-voltage System Contactor Closed* (06.070) is zero. This prevents power from being taken from the back-up supply if the mains supply is not present when the external soft-start system contactor is open.

The following diagram shows how these differences apply to the system operation.

Parameter	06.066 Low Under Voltage Threshold

Voltage	Default Value
200V	390
400V	780
575V	930
690V	1120

Braking IGBT Lower Threshold (06.073) defines the lowest level of *D.c. Bus Voltage* (05.005) where the braking IGBT will become active and *Braking IGBT Upper Threshold* (06.074) defines the level of *D.c. Bus Voltage* (05.005) where the braking IGBT will be on continuously. When the braking IGBT is turned on it will remain on for at least 1ms. The braking IGBT on-time is defined by the thresholds and the d.c. link voltage as given in the table below where L = *Braking IGBT Lower Threshold* (06.073) and U = *Braking IGBT Upper Threshold* (06.074).

D.c. link voltage level	On-time
<i>D.c. Bus Voltage</i> (05.005)	0%
$L \leq \text{D.c. Bus Voltage (05.005)}$	$[(\text{D.c. Bus Voltage (05.005)} - L) / (U - L)] \times 100\%$
$\text{D.c. Bus Voltage (05.005)} \geq U$	100%

As the *D.c. Bus Voltage* (05.005) rises above the lower threshold the braking IGBT is active with an on/off ratio of 1/100. As the voltage rises further, the on/off ratio increases until at the upper threshold the braking IGBT is on continuously. The upper and lower voltage threshold can be set up so that braking resistors in drives with parallel connected d.c. links will share the braking load.

If *Braking IGBT Lower Threshold* (06.073) \geq *Braking IGBT Upper Threshold* (06.074) then the braking IGBT is off when *D.c. Bus Voltage* (05.005) < *Braking IGBT Upper Threshold* (06.074) and on if *D.c. Bus Voltage* (05.005) \geq *Braking IGBT Upper Threshold* (06.074). This method of control is the same as that used in Unidrive SP and the default values for the braking thresholds are equal to the braking thresholds in Unidrive SP.

Unless sharing between braking resistors is required the braking thresholds do not normally need to be adjusted. Care should be taken when reducing the thresholds because if either threshold is below the maximum value of the peak rectified supply voltage the braking resistor could take power from the supply.

The list below gives conditions that will disable the braking IGBT:

1. *Braking IGBT Upper Threshold* (06.074) = 0, or *Low Voltage Braking IGBT Threshold Select* (06.076) = 1 and *Low Voltage Braking IGBT Threshold* (06.075) = 0.
2. The drive is in the under-voltage state.
3. A priority 1, 2 or 3 trip is active (see *Trip 0* (10.020)).
4. One of the following trips is active or would be active if another trip is not already active: *OI Brake*, *PSU*, *Th Brake Res* or *OHT Inverter*.
5. *Percentage Of Drive Thermal Trip Level* (07.036) = 100%. This is an indication that some part of the drive is too hot and is used to indicate if an internally fitted braking resistor is too hot.
6. *Brake R Too Hot* is active or the system has been set up to disable the braking IGBT based on the braking resistor temperature and the resistor is too hot (i.e. bit 2 of *Action On Trip Detection* (10.037) is set).

Parameter	06.074 Braking IGBT Upper Threshold		
Short description	Defines the level of the d.c. bus voltage where the braking IGBT will be on continuously		
Mode	Open-Loop

See *Low Voltage Braking IGBT Threshold* (06.075).

Parameter	06.084 Date And Time Offset		
Short description	Date And Time Offset		
Mode	Open-Loop		
Minimum	-12.00	Maximum	12.00
Default	0.00	Units	Hours
Type	16 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	2
Coding	RW		

Date And Time Offset (06.084) is an offset, specified in hours, that can be applied to the *Time* (06.017). If the offset applied causes the time to roll-over midnight then the *Date* (06.016) and *Day Of Week* (06.018) are also modified. The offset is only applied when the clock source is a clock derived from a keypad, i.e. *Date/Time Selector* (06.019) > 3. The offset can be used for time zone offsets or daylight saving time etc.

Mode: Open-Loop

Analog Outputs

The update rate for analog outputs is 250µs; although the output will only change at the update rate defined by the source parameter for the input. The following exceptions apply:

1. *Speed Feedback* (03.002) has an update rate of 4ms and includes a 16ms window filter. If this parameter is selected as a source for output 2 the update rate of the source changes to 250us and the only filter applied is the window filter associated with the position feedback interface (i.e. *P1 Feedback Filter* (03.042) for the P1 interface). It should be noted that this feature is only provided when the position feedback is from a drive interface and not from an option module.
2. If either analogue output is set up for current mode then the update rate for both analogue outputs is 4ms.

Analog Inputs

The normal sample rate for the analog inputs is 4ms, however this is increased to 250us for analogue inputs 1 and 2 under the following conditions:

1. The maximum and the minimum for the input are at their default values of 100.00% and -100.00% respectively.
2. The input is set to voltage mode.
3. One of the destinations given in the table below must be selected.
4. If the destination is *Analog Reference 1* (01.036) or *Analog Reference 2* (01.037) the reference system must not be in unipolar mode, i.e. *Bipolar Reference Enable* (01.010) must be one.

Note that *Analog Input 1 Fast Update Active* (07.026) and *Analog Input 2 Fast Update Active* (07.027) indicate if fast updating is active for each input.

Parameter	Drive modes	Comment
<i>Analog Reference 1</i> (01.036)	RFC-A, RFC-S	The data from <i>Analog Reference 1</i> (01.036) is processed in the 250us task so that the reference to the speed controller is updated every 250us.
<i>Analog Reference 2</i> (01.037)	RFC-A, RFC-S	The data from <i>Analog Reference 2</i> (01.037) is processed in the 250us task so that the reference to the speed controller is updated every 250us.
<i>Hard Speed Reference</i> (03.022)	RFC-A, RFC-S	
<i>Torque Reference</i> (04.008)	RFC-A, RFC-S	
<i>Power Input 1</i> (03.010) <i>Power Input 2</i> (03.013) <i>Power Input 3</i> (03.014)	Regen	

The diagram below shows the parameter structure for each I/O. See *Internal I/O Identifier* (11.068) for details of which I/O is present for different I/O options.

Parameter	07.001 Analog Input 1		
Short description	Displays the value of analog input 1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, FI, ND, NC, PT		

Each analogue input has a resolution of 11 bits plus sign. The inputs can operate in different modes (defined by *Analog Input 1 Mode* (07.007) for analogue input 1). These modes include voltage, current and thermistor modes. The available modes depend on the hardware configuration and are given in the table below.

Internal I/O Identifier (11.068)	Analogue Input 1	Analogue Input 2	Analogue Input 3
0: Standard Analogue and Digital I/O	Bipolar Voltage, Current	Bipolar Voltage, Current	Bipolar Voltage, Thermistor
1: Digital I/O	Not present	Not present	Thermistor, Disabled
2: HVAC Analogue and Digital I/O	Unipolar Voltage, Current, Thermistor	Unipolar Voltage, Current, Thermistor	Not present

The "Input Level" is defined for the different modes in the table below.

Mode	Input Level
Voltage	(Input Voltage / 10V) x 100.00%
0-20mA	(Input Current / 20mA) x 100.00%
20-0mA	((20mA - Input Current) / 20mA) x 100.00%
4-20mA	((Input Current - 4mA) / 16mA) x 100.00%
20-4mA	((20mA - Input Current) / 16mA) x 100.00%
Thermistor	(Input resistance / 10K Ohm) x 100%

Analog Input 1 (07.001) is derived as follows:

Limits

A_1 is the value after the minimum and maximum limits are applied.

If *Analog Input 1 Minimum* (07.040) \geq *Analog Input 1 Maximum* (07.043) then:

$A_1 = 0.00\%$ whatever the input level.

If *Analog Input 1 Minimum* (07.040) $<$ 0.00% and *Analog Input 1 Maximum* (07.043) $>$ 0.00% then:

$A_1 = \text{Input Level} \times (100.00\% / \text{Analog Input 1 Maximum (07.043)})$

A_1 is then limited between -100% and $+100\%$.

Otherwise:

Input Level is limited between *Analog Input 1 Minimum* (07.040) and *Analog Input 1 Maximum* (07.043)

$A_1 = [\text{Input Level} - \text{Analog Input 1 Minimum (07.040)}] \times 100.00\% / (\text{Analog Input 1 Maximum (07.043)} - \text{Analog Input 1 Minimum (07.040)})$

For thermistor modes it should be noted that *Analog Input 1 Minimum* (07.040) and *Analog Input 1 Maximum* (07.043) have no effect and that the input resistance is limited between 0 and 5k Ω .

Parameter	07.004 Monitored Temperature 1		
Short description	Displays the temperature set up by Temperature Monitor Select 1		
Mode	Open-Loop		
Minimum	-250	Maximum	250
Default		Units	$^{\circ}\text{C}$
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Thermal monitoring is provided within the drive to protect the power stage and the control system from over temperature.

Monitored Temperature 1 (07.004), *Monitored Temperature 2* (07.005) and *Monitored Temperature 3* (07.006) give an indication of the temperature of three selected monitoring points within the drive power system or control system. The required monitoring points can be selected using *Temperature Monitor Select 1* (07.038), *Temperature Monitor Select 2* (07.039) and *Temperature Monitor Select 3* (07.052) respectively. The default values give two monitoring points in the power system in *Monitored Temperature 1* (07.004) and *Monitored Temperature 2* (07.005), and control board temperature 1 in *Monitored Temperature 3* (07.006).

Parameter	07.005 Monitored Temperature 2		
Short description	Displays the temperature set up by Temperature Monitor Select 2		
Mode	Open-Loop		
Minimum	-250	Maximum	250
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Monitored Temperature 1* (07.004) for details.

Parameter	07.006 Monitored Temperature 3		
Short description	Displays the temperature set up by Temperature Monitor Select 3		
Mode	Open-Loop		
Minimum	-250	Maximum	250
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Monitored Temperature 1* (07.004) for details.

Parameter	07.008 Analog Input 1 Scaling		
Short description	Defines the scaling factor of analog input 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	10.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

Analog Input 1 (07.001) is modified by Analog Input 1 Scaling (07.008), Analog Input 1 Offset (07.030) and Analog Input 1 Invert (07.009) before it is routed to its destination as follows:

$$A_{1O} = \text{Analog Input 1 (07.001)} + \text{Analog Input 1 Offset (07.030)}$$

A_{1O} is the value after the offset has been applied and is limited between -100.00% and 100.00%

$$A_{1S} = A_{1O} \times \text{Analog Input 1 Scaling (07.008)}$$

A_{1S} is the value after the scaling and the offset have been applied and is limited between -100.00% and 100.00%

If Analog Input 1 Invert (07.009) = 0 then $A_{1I} = A_{1S}$ otherwise $A_{1I} = -A_{1S}$

A_{1I} is the value after the invert, scaling and offset have been applied and is the final value that is routed to the destination defined by Analog Input 1 Destination (07.010).

Parameter	07.009 Analog Input 1 Invert		
Short description	Inverts the signal for analog input 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See Analog Input 1 Scaling (07.008).

Parameter	07.010 Analog Input 1 Destination		
Short description	Defines the output parameter for analog input 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.036	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See Analog Input 1 Scaling (07.008).

Parameter	07.025 Calibrate Analog Input 1 Full Scale		
Short description	Calibrates the input level for analog input 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

For analog input 1, and in voltage mode only, the full scale value used to determine the input level can be changed from 10V by calibrating the input. The calibration process is triggered by setting Calibrate Analog Input 1 Full Scale (07.025) to one. Calibrate Analog Input 1 Full Scale (07.025) is cleared automatically when the calibration process is complete. After calibration the actions are as follows:

Input voltage during calibration	Result
$V < 1.5V$	The calibration result is ignored and the full scale is set to 10V. Analog Input 1 Full Scale (07.051) is set to zero.
$1.5V < V < 2.5V$	The calibration result is ignored and the full scale or Analog Input 1 Full Scale (07.051) are not affected.
$V > 2.5V$	The calibration result is used to set full scale and the value is also stored in Analog Input 1 Full Scale (07.051).

It should be noted that *Analog Input 1 Full Scale* (07.051) is a power-down save parameter, and so the result is automatically retained after power-down.

Parameter	07.026 Analogue Input 1 Fast Update Active		
Short description	Analogue Input 1 Fast Update Active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Analogue Input 1 Fast Update Active (07.026) is one if the destination for analogue input 1 is being updated at the fast rate of 250us.

Parameter	07.030 Analog Input 1 Offset		
Short description	Defines the offset of analog input 1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Analog Input 1 Scaling* (07.008).

Parameter	07.033 Power Output		
Short description	Instant output power		
Mode	Open-Loop		
Minimum	-100.0	Maximum	100.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

This is an instantaneous power output with fast update rate that is primarily intended to be used as a power feed-forward for applications with a Regen system front end. The full scale (100.0%) value is equal to a power of $3 \times (VM_DC_VOLTAGE[MAX] / 2\sqrt{2}) \times Full\ Scale\ Current\ Kc$ (11.061). This is compatible with the power output provided in Unidrive SP and is directly compatible with *Power Input 1* (03.010) (and the other power feed-forward parameters) in Regen mode. The scaling is intended to cover the maximum range of likely power in the drive. For example with a 400V 7.5kW drive the full scale d.c. link voltage is 831V and $Kc=38.222A$, and so the full scale value of this parameter is $3 \times (831 / 2\sqrt{2}) \times 38.222 = 33.689kW$. For Open-loop, RFC-A and RFC-S modes a positive value of power indicates power flowing from the drive to motor. For Regen mode a positive value of power indicates power flowing from the supply to the regen drive.

Parameter	07.034 Inverter Temperature		
Short description	Displays the estimated junction temperature of the hottest power device within the drive inverter		
Mode	Open-Loop		
Minimum	-250	Maximum	250
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Inverter Temperature (07.034) shows the estimated junction temperature of the hottest power device within the drive inverter. If this temperature exceeds the switch down threshold defined for the power stage the switching frequency is reduced provided this feature has not been disabled (see *Auto-switching Frequency Change* (05.035)).

Parameter	07.035 Percentage Of d.c. Link Thermal Trip Level		
Short description	Displays the percentage of the maximum allowed temperature as estimated by the thermal model of the d.c. link components		
Mode	Open-Loop		
Minimum	0	Maximum	100
Default		Units	%
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Percentage Of d.c. Link Thermal Trip Level (07.035) gives the percentage of the maximum allowed temperature as estimated by the thermal model of the d.c. link components.

Parameter	07.036 Percentage Of Drive Thermal Trip Level		
Short description	Displays the percentage of the thermal trip level of the temperature monitoring point or thermal model in the drive that is highest		
Mode	Open-Loop		
Minimum	0	Maximum	100
Default		Units	%
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Percentage Of Drive Thermal Trip Level (07.036) gives the percentage of the thermal trip level of the temperature monitoring point or thermal model in the drive that is highest. This includes all thermal monitoring points (not just those selected by *Monitored Temperature 1* (07.004), *Monitored Temperature 2* (07.005) and *Monitored Temperature 3* (07.006)), *Inverter Temperature* (07.034) and *Percentage Of d.c. Link Thermal Trip Level* (07.035).

Percentage Of d.c. Link Thermal Trip Level (07.035) is used directly to give *Percentage Of Drive Thermal Trip Level* (07.036), but for all other monitored values which are temperatures this is given by Percentage of thermal trip level = (Temperature - 40°C) / (Trip temperature - 40°C) x 100%

The location of the measurement or the thermal model that is related to this temperature is given in *Temperature Nearest To Trip Level* (07.037). If *Percentage Of Drive Thermal Trip Level* (07.036) exceeds 90% *Drive Over-temperature Alarm* (10.018) is set to one. If *Percentage Of Drive Thermal Trip Level* (07.036) reaches 100% one of the trips given in the table below is initiated. The trip can be reset when the percentage of thermal trip level fall below 95%.

Temperature	Trip
<i>Inverter Temperature</i> (07.034)	Oht Inverter
Power system temperature	Oht Power
<i>Percentage Of d.c. Link Thermal Trip Level</i> (07.035)	Oht dc Link
Control system temperature	Oht Control

Parameter	07.037 Temperature Nearest To Trip Level		
Short description	Displays the thermistor location or the model that corresponds to the value shown in Percentage Of Drive Thermal Trip Level		
Mode	Open-Loop		
Minimum	0	Maximum	20999
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Temperature Nearest To Trip Level (07.037) shows the thermistor location or the model that corresponds to the value shown in *Percentage Of Drive Thermal Trip Level* (07.036) in the form xxyzz as shown in the table below.

Source	xx	y	zz
Control system	00	0	01: Control board thermistor 1
Control system	00	0	02: Control board thermistor 2
Control system	00	0	03: I/O board thermistor (or internal braking resistor in servo Drive)
Control system	00	1	00: Inverter thermal model
Control system	00	2	00: D.c. link thermal model
Control system	00	3	00: Braking IGBT thermal model
Power system	01	0	zz: Thermistor location defined by zz in the power system
Power system	01	Rectifier number	zz: Thermistor location defined by zz in the rectifier

Parameter	07.038 Temperature Monitor Select 1		
Short description	Defines the temperature to be monitored in Monitored Temperature 1		
Mode	Open-Loop		
Minimum	0	Maximum	1999
Default	1001	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Temperature Monitor Select 1 (07.038) selects the temperature to be monitored in *Monitored Temperature 1* (07.004) using the format given for *Temperature Nearest To Trip Level* (07.037). If the monitoring point selected does not exist then the monitored temperature is always zero. The table below shows the monitoring points that can be selected.

Source	xx	y	zz
Control system	00	0	01: Control board thermistor 1
Control system	00	0	02: Control board thermistor 2
Control system	00	0	03: I/O board thermistor (or internal braking resistor in Servo Drive)
Control system	00	1	00: Inverter thermal model
Control system	00	3	00: Braking IGBT thermal model
Control system	00	4	00: Rectifier thermal model
Power system	01	0	zz: Thermistor location defined by zz in the power system
Power system	01	Rectifier number	zz: Thermistor location defined by zz in the rectifier

For a multi-module power system the power system measurement that can be selected is shown in the table below. It should be noted that the specific power module cannot be selected and that the highest temperature from each of the power modules is given.

Source	xx	y	zz
Power system	01	0	01: U phase power device thermistor
Power system	01	0	02: V phase power device thermistor
Power system	01	0	03: W phase power device thermistor
Power system	01	0	04: General rectifier thermistors
Power system	01	0	05: General power system thermistor

Parameter	07.039 Temperature Monitor Select 2		
Short description	Defines the temperature to be monitored in Monitored Temperature 2		
Mode	Open-Loop		
Minimum	0	Maximum	1999
Default	1002	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Temperature Monitor Select 1* (07.038).

Parameter	07.040 Analog Input 1 Minimum		
Short description	Defines the minimum value for analog input 1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Analog Input 1* (07.001).

Parameter	07.043 Analog Input 1 Maximum		
Short description	Defines the maximum value for analog input 1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Analog Input 1* (07.001).

Parameter	07.051 Analog Input 1 Full Scale		
Short description	Displays the full scale value of analog input 1		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Calibrate Analog Input 1 Full Scale* (07.025).

Parameter	07.052 <i>Temperature Monitor Select 3</i>		
Short description	Defines the temperature to be monitored in Monitored Temperature 3		
Mode	Open-Loop		
Minimum	0	Maximum	1999
Default	1	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Temperature Monitor Select 1* (07.038).

Menu 8 – Digital I/O

Mode: Open-Loop

Digital I/O Interface

The normal sample rate for the digital I/O system is 2ms, however it is possible to obtain a faster update rate for some parameters with certain inputs as described below. (Note that the keypad buttons and the rest button are always updated at the background rate and cannot be used for fast updating.)

Direction, read and write register parameters

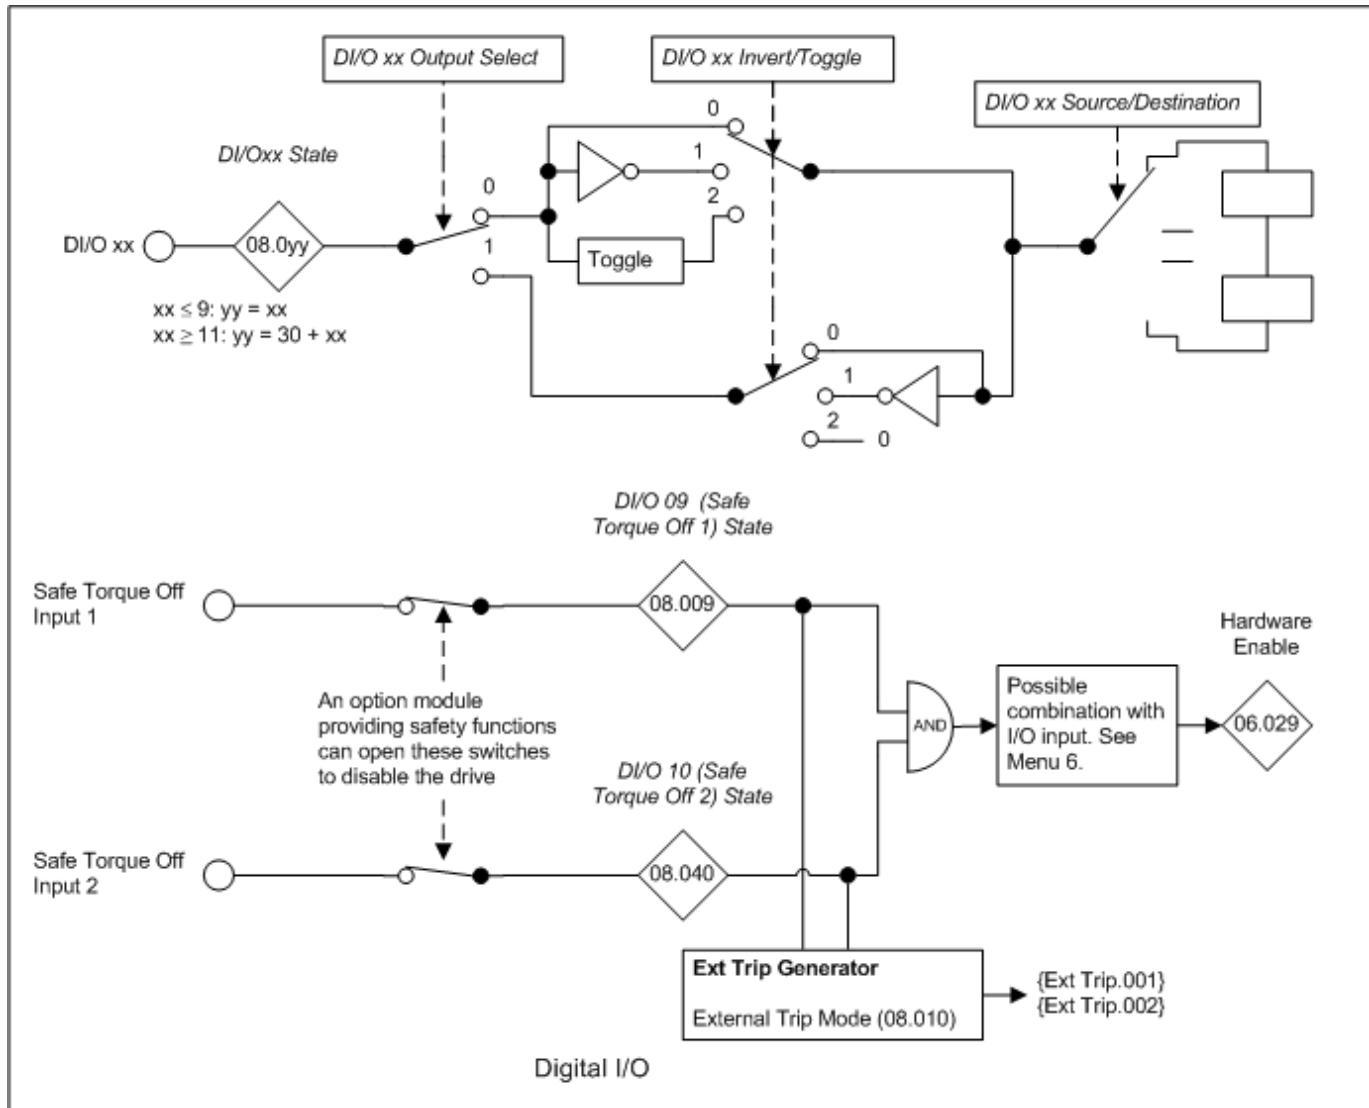

Digital I/O Output Enable Register 1 (08.071), Digital I/O Input Register 1 (08.072) and Digital I/O Output Register 1 (08.073) provide direct access to read/control the digital I/O that is integral to the drive.

Limit Switches

If digital inputs 4 or 5 are routed to either the Forward Limit Switch (06.035) or Reverse Limit Switch (06.036) in RFC-A or RFC-S modes the update rate is 250us.

Parameters

The parameter structure for each digital I/O is shown in the diagram below.

The table below covers all the possible digital I/O parameters. See *Internal I/O Identifier* (11.068) for details of which I/O is present for different I/O options.

DI/O	Function	State	Invert/Toggle	Source/Destination	Output Select
1	Input/Output	08.001	08.011	08.021	08.031
2	Input/Output	08.002	08.012	08.022	08.032
3	Input/Output	08.003	08.013	08.023	08.033
4	Input	08.004	08.014	08.024	
5	Input	08.005	08.015	08.025	
6	Input	08.006	08.016	08.026	
7	Relay Output	08.007	08.017	08.027	
8	24V Supply Output	08.008	08.018	08.028	
9	Safe Torque Off 1	08.009			
10	Safe Torque Off 2	08.040			
11	Keypad Run Button	08.041	08.051	08.061	
12	Keypad Auxiliary Button	08.042	08.052	08.062	
13	24V Supply Input	08.043	08.053	08.063

16	Drive Reset button	08.046			

Parameter	08.001 Digital Output 01 State		
Short description	Displays the state for digital output 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

The Digital I/O State parameter shows the state of digital I/O on the drive. All I/O except Digital Input 11 (Keypad Run Button), Digital Input 12 (Keypad Auxiliary Button), Digital Input 13 (24V Supply Input) and Digital Input 14 (Keypad Stop Button) use IEC61131-2 logic levels. As default the inputs use positive logic, and so the state parameter is 0 if the digital I/O is low or 1 if the digital I/O is high. *Input Logic Polarity* (08.029) can be set to zero to change the logic for Digital I/O1-6 to negative logic, so that the state parameter is 0 if the digital I/O is high or 1 if the digital I/O is low. The state parameter represents the digital I/O state whether it is an input or an output. If the digital I/O is configured as an output to be controlled using the *Digital I/O Output Register 1* (08.073) then the state parameter will still show the state of the output even though the route source is zero and the invert parameter has no effect.

Digital Input 11 (Keypad Run Button), Digital Input 12 (Keypad Auxiliary Button) and Digital Input 14 (Keypad Stop Button) represent the state of the Run, Auxiliary and Stop buttons on any keypad fitted to the drive; the input state is determined by ORing the state of the button on each keypad connected to the drive, if the button is pressed the state parameter is one otherwise it is zero. If a keypad is not fitted the state parameters are zero.

Digital Input 13 (24V Supply Input) is an external 24V supply input that is monitored and can be used as a 24V digital input if an external 24V supply is not required. The state parameter is low for the voltage range from 0V to 17V and high for the voltage range above 18V. As the input is a power supply it will consume significant current if the level is taken above 24V when the drive is running from its internal power supply, or at any voltage level if this input is the only power supply to the drive.

Digital Input 09 (STO input 1) and Digital Input 10 (STO input 2) correspond to two safe torque off channels within the drive. Both channels must be in the high state for the drive to be enabled. The state parameters are 0 if the digital input is low, or 1 if the digital input is high. If option slot 3 does not contain an option module providing safety functions then both safe torque off channels are connected to their state parameters and the safe torque off input can enable/disable the drive. If an option module providing safety functions is fitted in option slot 3 then the option module can disable the drive by breaking the path of either one or both safe torque off channels. See Menu 6 for details of the drive enable system.

Parameter	08.002 Digital Output 02 State		
Short description	Displays the state for digital output 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.004 Digital Input 04 State		
Short description	Displays the state for digital input 4		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.005 Digital Input 05 State		
Short description	Displays the state for digital input 5		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.008 24V Supply Output State		
Short description	Displays the state for 24V supply output		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.009 STO Input 01 State		
Short description	Displays the state for Safe Torque Off 1 input		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.010 External Trip Mode		
Short description	Defines behaviour of drive if STOs are low		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disable
1	STO 1
2	STO 2
3	STO 1 OR STO 2

If *External Trip Mode* (08.010) = 0 the safe torque off inputs simply enable or disable the drive. If *External Trip Mode* (08.010) > 0 it is possible to enable the following trip functions.

External Trip Mode (08.010)	Actions
0	Safe torque off inputs do not initiate trips
1	<i>External Trip.001</i> if Safe Torque Off Input 1 is low
2	<i>External Trip.002</i> if Safe Torque Off Input 2 is low
3	<i>External Trip.001</i> if Safe Torque Off is low OR <i>External Trip.002</i> if Safe Torque Off Input 2 is low

Parameter	08.011 Digital Output 01 Invert		
Short description	Set to invert Digital Output 01		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 allows the digital I/O to be non-inverted or inverted respectively.

Parameter	08.012 Digital Output 02 Invert		
Short description	Set to invert Digital Output 02		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

See *Digital Output 01 Invert* (08.011).

Parameter	08.014 Digital Input 04 Invert		
Short description	Set to invert Digital Input 04		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

See *Digital Output 01 Invert* (08.011).

Parameter	08.015 Digital Input 05 Invert		
Short description	Set to invert Digital Input 05		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

See *Digital Output 01 Invert* (08.011).

Parameter	08.018 24V Supply Output Invert		
Short description	Set to invert 24V Supply Output		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

See *Digital Output 01 Invert* (08.011).

Parameter	08.020 Digital I/O Read Word		
Short description	Displays the states for digital I/O 1 to 8		
Mode	Open-Loop		
Minimum	0	Maximum	511
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital I/O Read Word (08.020) reflects the state of digital input/output 1 to STO input 1 as given below. Each bit matches the value of the state parameter for the respective digital input or output.

Digital I/O Read Word (08.020) bit	Digital I/O
0	Digital I/O 1
1	Digital I/O 2
2	Digital I/O 3
3	Digital Input 4
4	Digital Input 5
5	Digital Input 6
6	Relay
7	24V Output
8	STO Input 1

Parameter	08.021 Digital Output 01 Source		
Short description	Defines the source parameter for Digital Output 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	10.003	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

The Digital I/O Source/Destination parameters provide the routing for the source and/or destination for the digital I/O.

Parameter	08.022 Digital Output 02 Source		
Short description	Defines the source parameter for Digital Output 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	12.040	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Digital Output 01 Source* (08.021).

Parameter	08.024 Digital Input 04 Destination		
Short description	Defines the destination parameter for Digital Input 4		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	6.030	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Digital Output 01 Source* (08.021).

Parameter	08.025 Digital Input 05 Destination		
Short description	Defines the destination parameter for Digital Input 5		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	6.032	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Digital Output 01 Source* (08.021).

Parameter	08.028 24V Supply Output Source		
Short description	Defines the source parameter for 24V Supply Output		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Digital Output 01 Source* (08.021).

Parameter	08.040 STO Input 02 State		
Short description	Displays the state for the Safe Torque Off 2 input		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.041 Keypad Run Button State		
Short description	Displays the state for the Keypad Run Forward button		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.042 Keypad Auxiliary Button State		
Short description	Displays the state for the Keypad Auxiliary button		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.044 Keypad Stop Button State		
Short description	Displays the state for the Keypad Stop button		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.046 Drive Reset Button State		
Short description	Displays the state of the reset button on the front of the drive		
Mode	Open-Loop		
Minimum	0	Maximum	0
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, NV, PT		

See *Digital Output 01 State* (08.001).

Parameter	08.051 Keypad Run Button Invert/Toggle		
Short description	Set to invert/toggle Keypad Run Button		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert
2	Toggle

A value of 0 or 1 allows the input state to be non-inverted or inverted respectively. An additional toggle function is provided for Keypad Run button inputs. The toggle function output changes state on each rising edge (0 to 1 change) at its input.

Parameter	08.052 Keypad Auxiliary Button Invert/Toggle		
Short description	Set to invert/toggle Keypad Auxiliary Button		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert
2	Toggle

A value of 0 or 1 allows the input state to be non-inverted or inverted respectively. An additional toggle function is provided for Keypad Auxiliary button inputs. The toggle function output changes state on each rising edge (0 to 1 change) at its input.

Parameter	08.061 Keypad Run Button Destination		
Short description	Defines the destination parameter for the keypad run button		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Digital Output 01 Source* (08.021).

Parameter	08.062 Keypad Auxiliary Button Destination		
Short description	Defines the destination parameter for the keypad auxiliary button		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Digital Output 01 Source* (08.021).

Parameter	08.071 Digital I/O Output Enable Register 1		
Short description	Displays the binary form of the DI/O output enable register		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000000000)	Maximum	65535 (Display: 1111111111111111)
Default	0 (Display: 0000000000000000)	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW, PT, BU		

The bits in the *Digital I/O Output Enable Register 1* (08.071), *Digital I/O Input Register 1* (08.072) and *Digital I/O Output Register 1* (08.073) each correspond with one digital I/O as shown below. The update rate of the individual bits in these registers differs depending upon the I/O.

DI/O	Bit	Function	Bit update rate		
			Input Register	Output Register	Output Enable Register
1	0	Digital Input/Output	2ms	250µs	Background
2	1	Digital Input/Output	2ms	250µs	Background
3	2	Digital Input/Output	2ms	2ms	Background
4	3	Digital Input	250µs	Not applicable	Not applicable
5	4	Digital Input	250µs	Not applicable	Not applicable
6	5	Digital Input	2ms	Not applicable	Not applicable
7	6	Relay Output	Bit always 0	2ms	Background
8	7	24V Supply Output	Bit always 0	2ms	Background
9	8	Safe Torque Off 1	2ms	Not applicable	Not applicable
10	9	Safe Torque Off 2	2ms	Not applicable	Not applicable
11	10	Keypad Run Button	Background	Not applicable	Not applicable
12	11	Keypad Auxiliary Button	Background	Not applicable	Not applicable
13	12	24V Supply Input	2ms	Not applicable	Not applicable
14	13	Keypad Stop Button	Background	Not applicable	Not applicable
15	14	Relay 2 Output	Bit always 0	2ms	Background
16	15	Drive Reset Button	Background	Not applicable	Not applicable

The *Digital I/O Input Register 1* (08.072) is always active and shows the value in the Digital I/O State parameter for all digital I/O configured as inputs. Bits in the *Digital I/O Output Register 1* (08.073) can be used to control the digital I/O directly. The bits control the output directly and are not modified by the corresponding Digital I/O Invert/Toggle function. The bits in the *Digital I/O Output Register 1* (08.073) only control the corresponding digital output if all the conditions below are met:

1. The corresponding bit in the *Digital I/O Output Enable Register 1* (08.071) must be set to 1.
2. The digital I/O must be an output, or it must be an input/output and the corresponding Digital I/O Output Select parameter must be one.
3. The corresponding Digital I/O Source/Destination parameter is not as valid source (e.g. 0.000) and the drive has been powered-up or reset since it was first selected.

If the above conditions are not met, the digital output is controlled by the normal logic.

Parameter	08.072 Digital I/O Input Register 1		
Short description	Displays the binary form of the DI/O input register		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000000000)	Maximum	65535 (Display: 1111111111111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	250µs write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Digital I/O Output Enable Register 1* (08.071).

Parameter	08.073 <i>Digital I/O Output Register 1</i>		
Short description	Displays the binary form of the DI/O output register		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000000000)	Maximum	65535 (Display: 1111111111111111)
Default	0 (Display: 0000000000000000)	Units	
Type	16 Bit Volatile	Update Rate	250µs read
Display Format	Binary	Decimal Places	0
Coding	RW, PT, BU		

See *Digital I/O Output Enable Register 1* (08.071).

Menu 9 – *User Functions 1*

Mode: Open-Loop

Menu 9 provides the parameters for the following features:

1. Logic functions
2. Motorised Pot
3. Binary Sum
4. Timers
5. Scope function

Logic functions

The logic functions are always active even if the sources and destinations are not routed to valid parameters. If the sources are not valid parameters then the source values are taken as 0. The update rate for each of the logic functions is always 4ms.

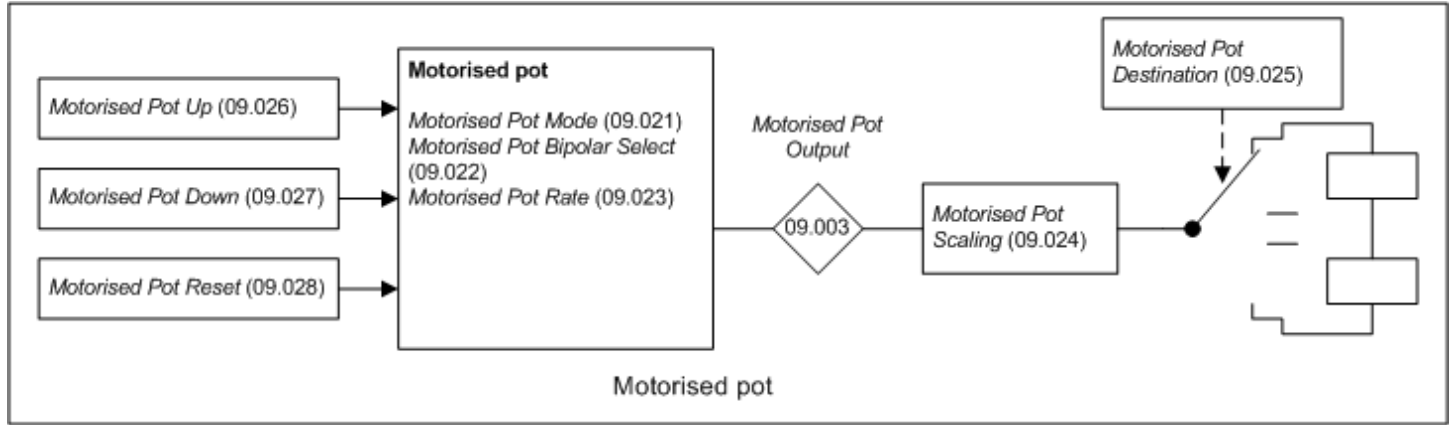

The logic function consists of an AND gate with inverters on each input and an inverter on the output. Some of the other standard logic functions can be produced as shown in the table below.

Logic function	Source 1 Invert	Source 2 Invert	Output Invert
AND	0	0	0
NAND	0	0	1
OR	1	1	1
NOR	1	1	0

A delay function is provided at the output of the logic functions. If *Logic Function 1 Delay* (09.009) or *Logic Function 2 Delay* (09.019) is positive then the output does not become 1 until the input to the delay has been at 1 for the delay time. If *Logic Function 1 Delay* (09.009) or *Logic Function 2 Delay* (09.019) is negative then the output remains at 1 until the input to the delay has been 0 for the delay time.

Motorised pot

If *Motorised Pot Reset* (09.028) = 1 then the motorised pot is disabled and held in its reset state with *Motorised Pot Output* (09.003) = 0.0%. If *Motorised Pot Reset* (09.028) = 0 the motorised pot is enabled even if *Motorised Pot Destination* (09.025) is not routed to a valid parameter. The sample rate of the motorised pot is always 4ms.

When the motorised pot is active *Motorised Pot Output* (09.003) can be increased or decreased by setting *Motorised Pot Up* (09.026) or *Motorised Pot Down* (09.027) to 1 respectively. If both *Motorised Pot Up* (09.026) and *Motorised Pot Down* (09.027) are 1 then *Motorised Pot Output* (09.003) is increased. The rate of change of *Motorised Pot Output* (09.003) is defined by *Motorised Pot Rate* (09.023) which gives the time to change from 0 to 100%. The time to change from -100% to 100% is *Motorised Pot Rate* (09.023) x 2. If *Motorised Pot Bipolar Select* (09.022) = 0 then *Motorised Pot Output* (09.003) is limited in the range 0.00% to 100.00%, otherwise it is allowed to change in the range from -100.00% to 100.00%.

Motorised Pot Mode (09.021) defines the mode of operation as given in the table below.

<i>Motorised Pot Mode</i> (09.021)	<i>Motorised Pot Output</i> (09.003)	<i>Motorised Pot Up</i> (09.026) and <i>Motorised Pot Down</i> (09.027) active
0	Reset to zero at power-up	Always
1	Set to power-down value at power-up	Always
2	Reset to zero at power-up	When <i>Drive Active</i> (10.002) = 1
3	Set to power-down value at power-up	When <i>Drive Active</i> (10.002) = 1
4	Reset to zero at power-up and when <i>Drive Active</i> (10.002) = 0	When <i>Drive Active</i> (10.002) = 1

Motorised Pot Scaling (09.024) introduces a scaling factor at the output of the motorised pot before the output is routed to the destination. If *Motorised Pot Scaling* (09.024) *Motorised Pot Scaling* (09.024) > 1.000 the output will exceed the range of the destination parameter, and so the destination parameter will be at its maximum or minimum before the output of the motorised pot reaches the limits of its range.

Binary sum function

The binary sum function is always active even if the destination is not routed to valid a parameter. The update rate for the binary sum is always 4ms.

The output of the binary sum block is given by:

$$\text{Binary Sum Output (09.032)} = \text{Binary Sum Offset (09.034)} + (\text{Binary Sum Ones (09.029)} \times 1) + (\text{Binary Sum Twos (09.030)} \times 2) + (\text{Binary Sum Fours (09.031)} \times 4)$$

Binary Sum Destination (09.033) defines the destination for the binary sum output. The routing for this destination is special if the maximum of the destination parameter $\leq 7 + \text{Binary Sum Offset}$ (09.034) as follows:

Destination parameter = *Binary Sum Output* (09.032), subject to the parameter minimum.

If the maximum of the destination parameter $> 7 + \text{Binary Sum Offset}$ (09.034), *Binary Sum Output* (09.032) is routed in the same way as any other destination where the destination target is at its full scale value when the *Binary Sum Output* (09.032) = $7 + \text{Binary Sum Offset}$ (09.034).

Timers

If the enable input to a timer is active and the repeat function is set to a non-zero value then the timer is active even if the destination is not routed to valid a parameter. The timers are updated in the background task and have a resolution of 1s.

The following is a description of Timer 1, but Timer 2 behaves in the same way. If *Timer 1 Invert* (09.041) = 0 then *Timer 1 Output* (09.042) is inactive before the *Timer 1 Start Date* (09.035) / *Timer 1 Start Time* (09.036), active between this date/time and *Timer 1 Stop Date* (09.037) / *Timer 1 Stop Time* (09.038) and then inactive after the stop time/date within the timer 1 repeat period as shown in the diagram below.

Timer 1 Repeat Function (09.039) defines the length of the repeat period. For example, if *Timer 1 Repeat Function* (09.039) = 2 then the repeat period is one day. The output is inactive until the time reaches the hour, minute and second defined in *Timer 1 Start Time* (09.036), and remains active until the time reaches the hour, minute and second defined in *Timer 1 Stop Time* (09.038). Different repeat periods may be selected as given in the table below. The table shows the constituent parts of the date and time that are used to determine the start and stop events. If the repeat period is set to every week then *Timer 1 Start Date* (09.035) and *Timer 1 Stop Date* (09.037) define the day of the week and not the date (i.e. 00.00.00 = Sunday, 00.00.01 = Monday, etc.). The week repeat period starts at 00.00.00 on Sunday morning and ends at 23.59.59 on Saturday night. If the stop time event is set to occur at or before the start time event or the *Timer 1 Repeat Function* (09.039) = 0 or *Timer 1 Enable* (09.040) = 0 the output remains inactive at all times (i.e. *Timer 1 Output* (09.042) = 0 if *Timer 1 Invert* (09.041) = 0).

<i>Timer 1 Repeat Function</i> (09.039)	Repeat period	Second	Minute	Hour	Day	Month	Year	Day of week
0	None							
1	Hour	.	.					
2	Day	.	.	.				
3	Week
4	Month			
5	Year		
6	One off	
7	Minute	.						

As *Timer 1 Invert* (09.041) inverts the timer output it can be used to give an active state of 0 instead of 1. Alternatively it can be used to give an active state of 1, but for a time period that spans the ends of the repeat period as shown in the example above. It should be noted that if this method is used to allow the active period to span the ends of the repeat period then if the timer is disabled the output of the timer block before the invert becomes 0, and so the final output of the timer after the invert is 1.

If *Date/Time Selector* (06.019) is changed and the drive is reset then the source for the timers will change, therefore *Timer 1 Repeat Function* (09.039) and *Timer 2 Repeat Function* (09.049) are reset to 0 to disable the timers, and the date and time entries in the trip log are cleared.

Scope function

Parameter	09.001 Logic Function 1 Output		
Short description	Shows the output state of logic function 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Logic Function 1 Output (09.001) shows the output of logic function 1.

Parameter	09.002 Logic Function 2 Output		
Short description	Shows the output state of logic function 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Logic Function 2 Output (09.002) shows the output of logic function 2.

Parameter	09.003 Motorised Pot Output		
Short description	Shows the output level of the motorised pot function		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Power Down Save	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Motorised Pot Output (09.003) shows the output of the motorised pot function.

Parameter	09.004 Logic Function 1 Source 1		
Short description	Defines input source 1 of logic function 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 1 Source 1 (09.004) defines input source 1 of logic function 1.

Parameter	09.005 Logic Function 1 Source 1 Invert		
Short description	Set to invert input 1 of logic function 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 1 Source 1 Invert (09.005) inverts input 1 of logic function 1.

Parameter	09.006 Logic Function 1 Source 2		
Short description	Defines input source 2 of logic function 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 1 Source 2 (09.006) defines input source 2 of logic function 1.

Parameter	09.007 Logic Function 1 Source 2 Invert		
Short description	Set to invert input 2 of logic function 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 1 Source 2 Invert (09.007) inverts input 2 of logic function 1.

Parameter	09.008 Logic Function 1 Output Invert		
Short description	Set to invert the output of logic function 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 1 Output Invert (09.008) inverts the output of logic function 1.

Parameter	09.009 Logic Function 1 Delay		
Short description	Defines the output delay of logic function 1		
Mode	Open-Loop		
Minimum	-25.0	Maximum	25.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW		

Logic Function 1 Delay (09.009) defines the delay at the output of logic function 1. If Logic Function 1 Delay (09.009) is positive then the output does not become 1 until the input to the delay has been at 1 for the delay time. If Logic Function 1 Delay (09.009) is negative then the output remains at 1 until the input to the delay has been 0 for the delay time.

Parameter	09.010 Logic Function 1 Destination		
Short description	Defines the output destination of logic function 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Logic Function 1 Destination (09.010) defines the output destination of logic function 1.

Parameter	09.014 Logic Function 2 Source 1		
Short description	Defines input source 1 of logic function 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 2 Source 1 (09.014) defines input source 1 of logic function 2.

Parameter	09.015 Logic Function 2 Source 1 Invert		
Short description	Set to invert input 1 of logic function 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 2 Source 1 Invert (09.015) inverts input 1 of logic function 2.

Parameter	09.016 Logic Function 2 Source 2		
Short description	Defines input source 2 of logic function 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 2 Source 2 (09.016) defines input source 2 of logic function 2.

Parameter	09.017 Logic Function 2 Source 2 Invert		
Short description	Set to invert input 2 of logic function 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

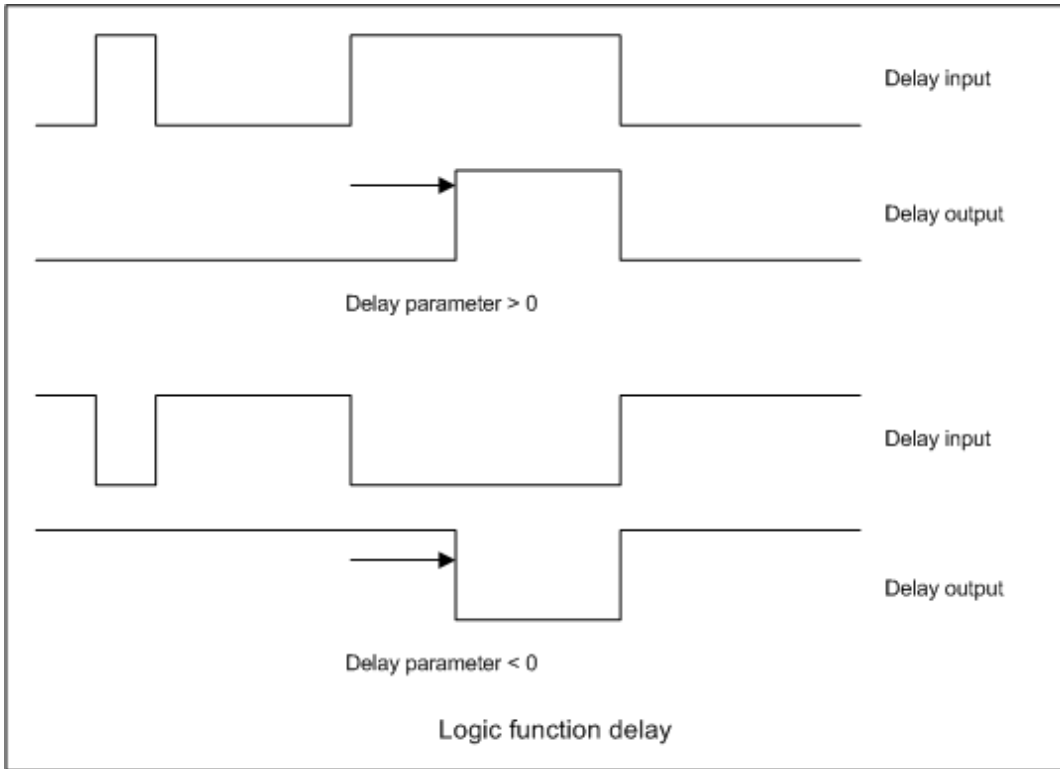

Setting Logic Function 2 Source 2 Invert (09.017) inverts input 2 of logic function 2.

Parameter	09.018 Logic Function 2 Output Invert		
Short description	Set to invert the output of logic function 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 2 Output Invert (09.018) inverts the output of logic function 2.

Parameter	09.019 Logic Function 2 Delay		
Short description	Defines the output delay of logic function 2		
Mode	Open-Loop		
Minimum	-25.0	Maximum	25.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW		

Logic Function 2 Delay (09.019) defines the delay at the output of logic function 1. If Logic Function 2 Delay (09.019) is positive then the output does not become 1 until the input to the delay has been at 1 for the delay time. If Logic Function 2 Delay (09.019) is negative then the output remains at 1 until the input to the delay has been 0 for the delay time.

Parameter	09.020 Logic Function 2 Destination		
Short description	Defines the output destination of logic function 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Logic Function 2 Destination (09.020) defines the output destination of logic function 2.

Parameter	09.021 Motorised Pot Mode		
Short description	Defines the motorised pot mode		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Motorised Pot Mode (09.021) defines the mode of operation as given in the table below.

Motorised Pot Mode (09.021)	Motorised Pot Output (09.003)	Motorised Pot Up (09.026) and Motorised Pot Down (09.027) active
0	Reset to zero at power-up	Always
1	Set to power-down value at power-up	Always
2	Reset to zero at power-up	When Drive Active (10.002) = 1
3	Set to power-down value at power-up	When Drive Active (10.002) = 1
4	Reset to zero at power-up and when Drive Active (10.002) = 0	When Drive Active (10.002) = 1

Parameter	09.022 Motorised Pot Bipolar Select		
Short description	Set to enable bipolar operation of the motorised pot		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

If Motorised Pot Bipolar Select (09.022) = 0 then Motorised Pot Output (09.003) is limited in the range 0.00% to 100.00%, otherwise it is allowed to

change in the range from -100.00% to 100.00%.

Parameter	09.023 Motorised Pot Rate		
Short description	Defines the rate of change of the motorised pot output		
Mode	Open-Loop		
Minimum	0	Maximum	250
Default	20	Units	s
Type	8 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

The rate of change of *Motorised Pot Output* (09.003) is defined by *Motorised Pot Rate* (09.023) which gives the time to change from 0 to 100%. The time to change from -100% to 100% is *Motorised Pot Rate* (09.023) x 2.

Parameter	09.024 Motorised Pot Scaling		
Short description	Defines the scaling factor for the motorised pot output		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

Motorised Pot Scaling (09.024) introduces a scaling factor at the output of the motorised pot before the output is routed to the destination. If *Motorised Pot Scaling* (09.024) $>$ 1.000 the output will exceed the range of the destination parameter, and so the destination parameter will be at its maximum or minimum before the output of the motorised pot reaches the limits of its range.

Parameter	09.025 Motorised Pot Destination		
Short description	Defines the output destination of the motorised pot		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Logic Function 2 Destination (09.020) defines the output destination of the motorised pot function.

Parameter	09.026 Motorised Pot Up		
Short description	Set to increase the motorised pot output		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Motorised Pot Up* (09.026) = 1, then the *Motorised Pot Output* (09.003) will increase.

Parameter	09.027 Motorised Pot Down		
Short description	Set to decrease the motorised pot output		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Motorised Pot Down* (09.027) = 1, then the *Motorised Pot Output* (09.003) will decrease.

Parameter	09.028 Motorised Pot Reset		
Short description	Set to reset the motorised pot output to zero		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Motorised Pot Reset* (09.028) = 1 then the motorised pot is disabled and held in its reset state with *Motorised Pot Output* (09.003) = 0.0%. If *Motorised Pot Reset* (09.028) = 0 the motorised pot is enabled even if *Motorised Pot Destination* (09.025) is not routed to a valid parameter.

Parameter	09.029 Binary Sum Ones		
Short description	Set to add one to the binary sum output		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Binary Sum Output* (09.032).

Parameter	09.030 Binary Sum Twos		
Short description	Set to add two to the binary sum output		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Binary Sum Output* (09.032).

Parameter	09.031 Binary Sum Fours		
Short description	Set to add three to the binary sum output		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Binary Sum Output* (09.032).

Parameter	09.032 Binary Sum Output		
Short description	Shows the output level of the binary sum		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The output of the binary sum block is given by:

$$\text{Binary Sum Output (09.032)} = \text{Binary Sum Offset (09.034)} + (\text{Binary Sum Ones (09.029)} \times 1) + (\text{Binary Sum Twos (09.030)} \times 2) + (\text{Binary Sum Fours (09.031)} \times 4)$$

Binary Sum Destination (09.033) defines the destination for the binary sum output. The routing for this destination is special if the maximum of the destination parameter $\leq 7 + \text{Binary Sum Offset (09.034)}$ as follows:

Destination parameter = *Binary Sum Output* (09.032), subject to the parameter minimum.

If the maximum of the destination parameter $> 7 + \text{Binary Sum Offset (09.034)}$, *Binary Sum Output* (09.032) is routed in the same way as any other destination where the destination target is at its full scale value when the *Binary Sum Output* (09.032) = $7 + \text{Binary Sum Offset (09.034)}$.

Parameter	09.033 Binary Sum Destination		
Short description	Defines the output destination of the binary sum		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Binary Sum Destination (09.033) defines the destination for the binary sum output.

See *Binary Sum Output* (09.032) for more information.

Parameter	09.034 Binary Sum Offset		
Short description	Defines the offset added to the output of the binary sum		
Mode	Open-Loop		
Minimum	0	Maximum	248
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Binary Sum Output* (09.032).

Parameter	09.035 Timer 1 Start Date		
Short description	Defines the start date for timer 1		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 1 Start Date (09.035) defines the start date within the repeat period of timer 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.036 Timer 1 Start Time		
Short description	Defines the start time for timer 1		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 1 Start Time (09.036) defines the start time within the repeat period of timer 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.037 Timer 1 Stop Date		
Short description	Defines the stop date for timer 1		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 1 Stop Date (09.037) defines the stop date within the repeat period of timer 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.038 Timer 1 Stop Time		
Short description	Defines the stop time for timer 1		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 1 Stop Time (09.038) defines the stop time within the repeat period of timer 1.

See Timer 1 Repeat Function (09.039) for more information.

Parameter	09.039 Timer 1 Repeat Function		
Short description	Defines the length of the repeat period		
Mode	Open-Loop		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	Hour
2	Day
3	Week
4	Month
5	Year
6	One off
7	Minute

Timer 1 Repeat Function (09.039) defines the length of the repeat period. For example, if Timer 1 Repeat Function (09.039) = 2 then the repeat period is one day. The result is inactive until the time reaches the hour, minute and second defined in Timer 1 Start Time (09.036), and remains active until the time reaches the hour, minute and second defined in Timer 1 Stop Time (09.038). Different repeat periods may be selected as given in the table below. The table shows the constituent parts of the date and time that are used to determine the start and stop events. If the repeat period is set to every week then Timer 1 Start Date (09.035) and Timer 1 Stop Date (09.037) define the day of the week and not the date (i.e. 00.00.00 = Sunday, 00.00.01 = Monday, etc.). If the stop time event is set to occur at or before the start time event or the Timer 1 Repeat Function (09.039) = 0 or Timer 1 Enable (09.040) = 0 the result remains inactive at all times (i.e. Timer 1 Output (09.042) = 0 if Timer 1 Invert (09.041) = 0).

Timer 1 Repeat Function (09.039)	Repeat period	Second	Minute	Hour	Day	Month	Year	Day of week
0	None							
1	Hour	.	.					
2	Day	.	.	.				
3	Week
4	Month			
5	Year		
6	One off	
7	Minute	.						

Parameter	09.040 Timer 1 Enable		
Short description	Set to enable the timer 1 function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 1 Enable (09.040) enables the timer 1 function. If Timer 1 Enable (09.040) = 0, then the output of the timer is always inactive, i.e. Timer 1 Output (09.042) = 0.

Parameter	09.041 Timer 1 Invert		
Short description	Set to invert the output of timer 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 1 Invert (09.041) inverts the timer output to give an active state of 0 instead of 1. Alternatively it can be used to give an active state of 1, but for a time period that spans the ends of the repeat period as shown in the example above. It should be noted that if this method is used to allow the active period to span the ends of the repeat period then if the timer is disabled the output of the timer block before the invert becomes 0, and so the final output of the timer after the invert is 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.042 Timer 1 Output		
Short description	Shows the output state of timer function 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Timer 1 Output (09.042) shows the output of timer function 1.

Parameter	09.043 Timer 1 Destination		
Short description	Defines the output destination of timer function 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Timer 1 Destination (09.043) defines the output destination of timer function 1.

Parameter	09.045 Timer 2 Start Date		
Short description	Defines the start date for timer 2		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 2 Start Date (09.045) defines the start date within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.046 Timer 2 Start Time		
Short description	Defines the start time for timer 2		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 2 Start Time (09.046) defines the start time within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.047 Timer 2 Stop Date		
Short description	Defines the stop date for timer 2		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 2 Stop Date (09.047) defines the stop date within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.048 Timer 2 Stop Time		
Short description	Defines the stop time for timer 2		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 2 Stop Time (09.048) defines the stop time within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.049 Timer 2 Repeat Function		
Short description	Defines the length of the repeat period		
Mode	Open-Loop		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	Hour
2	Day
3	Week
4	Month
5	Year
6	One off
7	Minute

See *Timer 1 Repeat Function* (09.039).

Parameter	09.050 Timer 2 Enable		
Short description	Set to enable the timer 2 function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 2 Enable (09.050) enables the timer 2 function. If *Timer 2 Enable* (09.050) = 0, then the output of the timer is always inactive, i.e. *Timer 2 Output* (09.052) = 0.

Parameter	09.051 <i>Timer 2 Invert</i>		
Short description	Set to invert the output of timer 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 2 Invert (09.051) inverts the timer output to give an active state of 0 instead of 1.

See *Timer 1 Invert* (09.041) for more information.

Parameter	09.052 <i>Timer 2 Output</i>		
Short description	Shows the output state of timer function 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Timer 2 Output (09.052) shows the output of timer function 2.

Parameter	09.053 <i>Timer 2 Destination</i>		
Short description	Defines the output destination of timer function 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Timer 2 Destination (09.053) defines the output destination of timer function 2.

Parameter	09.055 <i>Scope Trace 1 Source</i>		
Short description	Defines the source of scope trace 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.001	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Up to four scope sources can be selected using *Scope Trace 1 Source* (09.055) to *Scope Trace 4 Source* (09.058). If the source value is set to 0.000, or the source parameter does not exist or is non-visible, then no source is selected. The sources do not operate in the same way as normal source parameters in that the input to the scope is the actual value of the parameter and not a value scaled to a percentage based on the range of the parameter. If a scope trace source parameter is modified the actual change is not effective until the drive is reset.

Parameter	09.056 <i>Scope Trace 2 Source</i>		
Short description	Defines the source of scope trace 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	4.002	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Scope Trace 1 Source* (09.055).

Parameter	09.057 Scope Trace 3 Source		
Short description	Defines the source of scope trace 3		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Scope Trace 1 Source* (09.055).

Parameter	09.058 Scope Trace 4 Source		
Short description	Defines the source of scope trace 4		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Scope Trace 1 Source* (09.055).

Parameter	09.059 Scope Trigger		
Short description	Set to trigger the scope function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW		

The scope is triggered by a rising edge at the input to the main scope block. If *Scope Trigger Source* (09.060) is set at its default value of 0.000 then the output of the trigger threshold comparator is 0, and so the scope can be triggered with *Scope Trigger* (09.059). *Scope Trigger Invert* (09.062) can be used to invert the trigger signal.

Parameter	09.060 Scope Trigger Source		
Short description	Defines the source of the scope trigger		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	10.001	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

If *Scope Trigger* (09.059) = 0, the scope can be triggered based on the level of a parameter defined by *Scope Trigger Source* (09.060) and the *Scope Trigger Threshold* (09.061). This source operates in the same way as the trace sources and a direct comparison is made between the actual parameter value and the threshold. Decimal places are ignored. The threshold detector output is 1 when the value from the scope trigger source is greater than *Scope Trigger Threshold* (09.061). If *Scope Trigger Source* (09.060) = 0.000, or it is used to select a parameter that does not exist or is non-visible, then the output of the threshold detector is 0.

Parameter	09.061 Scope Trigger Threshold		
Short description	Defines the scope trigger threshold		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Scope Trigger Source* (09.060).

Parameter	09.062 Scope Trigger Invert		
Short description	Set to invert the scope trigger		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Scope Trigger* (09.059).

Parameter	09.063 Scope Mode		
Short description	Defines the mode of the scope		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Single
1	Normal
2	Auto

Single (0):

If *Scope Arm* (09.064) is set to 1 the scope starts to acquire pre-trigger data (i.e. enough data to provide information for the pre-trigger period) and *Scope Data Not Ready* (09.065) is set to 1. The scope can then be triggered on the next trigger event (i.e. a rising edge on the trigger input of the main scope block). Note that the scope can only be triggered once the required amount of pre-trigger data has been sampled. Failure to do this will result in the scope function not triggering correctly. When the trigger event occurs *Scope Arm* (09.064) is set to 0, and when the post-trigger data has been stored *Scope Data Not Ready* (09.065) is set to 0. If *Scope Auto-save Mode* (09.070) is non-zero, the data in the scope trace buffer is saved to a non-volatile media card fitted in the drive. When the save is complete (or data cannot be saved, i.e. no card fitted or no space left) the scope is ready again to receive data. If *Scope Arm* (09.064) is set to 1 the scope will start to acquire data again.

It is possible to read scope files via comms or into an option module. However, scope file transfer can only be initiated when *Scope Arm* (09.064) = 0, *Scope Data Not Ready* (09.065) = 0, *Scope Saving Data* (09.066) = 0 and at least one trace has been set up. While the file transfer is in progress *Scope Saving Data* (09.066) is set to 1.

The scope system is reset under any of the following conditions:

1. At power-up.
2. If the drive is reset when *Scope Trace 1 Source* (09.055) to *Scope Trace 4 Source* (09.058) have been modified.
3. The drive mode is changed.
4. If *Scope Mode* (09.063), *Scope Sample Time* (09.067) or *Scope Trigger Delay* (09.068) are modified.

When the scope is reset *Scope Arm* (09.064) is reset to 0 and the trace data is all cleared to 0..

Normal (1):

The scope operates in the same way as single mode except that *Scope Arm* (09.064) is automatically set back to 1 after a time delay of 1s once the post-trigger data has been acquired, and the scope data has been saved to a non-volatile media card if *Scope Auto-save Mode* (09.070) > 0.

Auto (2):

After the scope system is reset *Scope Data Not Ready* (09.065) is set to 1 and the scope begins to acquire data. Once the buffer is full *Scope Data Not Ready* (09.065) is set to 0 and the scope continues to acquire data. *Scope Arm* (09.064) has no effect on data acquisition. Provided *Scope Data Not Ready* (09.065) = 0 and *Scope Saving Data* (09.066) = 0 it is possible to read the data from the scope buffer as a scope file. Data acquisition is stopped when the file transfer begins. When the file transfer is complete, data acquisition begins again and *Scope Data Not Ready* (09.065) is set to 1 for a period that is long enough to fill the scope buffer with new data.

Parameter	09.064 Scope Arm		
Short description	Set to arm the scope		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Scope Mode* (09.063).

Parameter	09.065 Scope Data Not Ready		
Short description	Shows that the data in the scope buffer is not ready to be read out		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Scope Mode* (09.063).

Parameter	09.066 Scope Saving Data		
Short description	Shows when the scope is saving data		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Scope Mode* (09.063).

Parameter	09.067 Scope Sample Time		
Short description	Defines the sample time of the scope		
Mode	Open-Loop		
Minimum	1	Maximum	200
Default	4	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Scope Sample Time (09.067) defines the sample rate of the scope function for all traces in 250µs units (i.e. if *Scope Sample Time* (09.067) = 4, the sample time is 1ms).

Parameter	09.068 Scope Trigger Delay		
Short description	Defines how much pre-trigger data is stored by the scope		
Mode	Open-Loop		
Minimum	0	Maximum	100
Default	100	Units	%
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Scope Trigger Delay (09.068) defines how much data is stored before and after the scope is triggered. If *Scope Trigger Delay* (09.068) = 0% then no data is stored before the trigger and all the data is after the trigger. If *Scope Trigger Delay* (09.068) = 100% then no data is stored after the trigger, but all the data is before the trigger.

Parameter	09.069 Scope Time Period		
Short description	Shows the time period covered by the scope buffer		
Mode	Open-Loop		
Minimum	0.00	Maximum	200000.00
Default		Units	ms
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

The scope function can capture up to 4000 bytes of parameter data. The *Scope Time Period* (09.069) gives the length of the time period covered by the scope buffer in milliseconds which depends on the number of traces stored, the sample time and the size of the parameters used as trace sources.

Sample time in milliseconds = $(250 \times 10^{-6} \times \text{Scope Sample Time (09.067)}) \times 1000$

Size of trace data is the sum of the number of bytes in each of the trace sources selected by *Scope Trace 1 Source* (09.055) to *Scope Trace 4 Source* (09.058).

Scope Time Period (09.069) (ms) = $4000 \times \text{Sample time in milliseconds} / \text{Size of trace data}$

Parameter	09.070 Scope Auto-save Mode		
Short description	Defines the mode for auto-saving scope files to the NV media card		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Overwrite
2	Keep

Auto-save mode can be used to store a scope file on a non-volatile media card at each trigger event. The auto-save system is held in reset if *Scope Auto-save Reset* (09.072) = 1. When the auto-save system is reset all the scope files in scope file folder on the NV media card are deleted, *Scope Auto-save File Number* (09.071) is reset to 0 and the auto-save system is inactive. If any of the file operations fail during reset *Scope Auto-save Status* (09.073) is 3 (Failed) when the reset is removed.

The following conditions must be met for auto-saving to be active:

1. *Scope Auto-save Mode* (09.070) is non-zero
2. *Scope Auto-save Reset* (09.072) = 0
3. *Scope Auto-save Status* (09.073) = 1 (Active)
4. *Scope Mode* (09.063) = 0 (Single) or 1 (Normal)

If auto-saving is active an attempt is made to copy the scope file to a non-volatile media card fitted to the drive each time the post-trigger data has been acquired. The file name is SCP00XY.DAT, where XY is defined by *Scope Auto-save File Number* (09.071). If *Scope Auto-save Mode* (09.070) = 1 (Overwrite) then a file is over-written if it already exists. If *Scope Auto-save Mode* (09.070) = 2 (Keep) then if the file already exists the auto-save process is aborted. *Scope Auto-save File Number* (09.071) is incremented after a file is saved successfully and rolls over to 0 if it exceeds its maximum value.

If *Scope Auto-save Status* (09.073) = 0 (Disabled) and all the other conditions listed above for auto-saving to be active are met, then *Scope Auto-save Status* (09.073) changes to 1 (Active), so that auto-saving becomes active. If the scope file cannot be saved because the file exists and *Scope Auto-save Mode* (09.070) = 2 (Keep) then *Scope Auto-save Status* (09.073) is set to 2 (Stopped). If the scope file cannot be saved for any other reason then *Scope Auto-save Status* (09.073) is set to 3 (Failed). If *Scope Auto-save Status* (09.073) is no longer 1 (Active), auto-saving is aborted. Auto-saving can be made active again by setting *Scope Auto-save Reset* (09.072) to 1 and then to 0. If *Scope Auto-save Mode* (09.070) = 0 (Disabled) then *Scope Auto-save Status* (09.073) is set to 0 (Disabled), or if *Scope Auto-save Mode* (09.070) is non-zero then *Scope Auto-save Status* (09.073) is set to 1 (Active). It should be noted that *Scope Auto-save Status* (09.073) is a power-down save parameter, and so auto-save will remain inactive if *Scope Auto-save Status* (09.073) is 2 or 3 even if the drive is powered down and then powered up again.

Parameter	09.071 Scope Auto-save File Number		
Short description	Shows the file number to be used for the next auto-saved scope file		
Mode	Open-Loop		
Minimum	0	Maximum	99
Default	0	Units	
Type	8 Bit Power Down Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RO, NC		

See *Scope Auto-save Mode* (09.070).

Parameter	09.072 Scope Auto-save Reset		
Short description	Set to reset the scope auto-save function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Scope Auto-save Mode* (09.070).

Parameter	09.073 Scope Auto-save Status		
Short description	Shows the status of the scope auto-save function		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, NC		

Value	Text
0	Disabled
1	Active
2	Stopped
3	Failed

See *Scope Auto-save Mode* (09.070).

Menu 10 – *Status and Trips*

Mode: Open-Loop

Parameter				10.001 Drive Healthy			
Short description				Indicates that the drive is healthy			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default				Units			
Type		1 Bit Volatile		Update Rate		Background write	
Display Format		Standard		Decimal Places		0	
Coding				RO, ND, NC, PT			

Drive Healthy (10.001) indicates that the drive is not in the trip or the under voltage state if it is set to one. If *Auto-reset Hold Drive Healthy* (10.036) = 1 and auto-reset is being used, *Drive Healthy* (10.001) is not cleared until all auto-resets have been attempted and the next trip occurs. The LED on the front of the drive gives an indication of the drive state as shown in the table below.

Drive State	LED
Normal power and <i>Drive Healthy</i> (10.001) = 1	On continuously
Normal power and <i>Drive Healthy</i> (10.001) = 0	Flashing: 0.5s on and 0.5s off
Standby power state	Flashing: 0.5s on and 7.5s off

Parameter				10.002 Drive Active			
Short description				Indicates that the inverter is active			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default				Units			
Type		1 Bit Volatile		Update Rate		2ms write	
Display Format		Standard		Decimal Places		0	
Coding				RO, ND, NC, PT			

If the drive inverter is active *Drive Active* (10.002) is set to one, otherwise it is zero.

Parameter				10.003 Zero Speed			
Short description				Indicates that the speed is below the zero speed threshold			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default				Units			
Type		1 Bit Volatile		Update Rate		Background write	
Display Format		Standard		Decimal Places		0	
Coding				RO, ND, NC, PT			

Zero Speed (10.003) is set to one under the zero speed conditions, otherwise it is zero. See *Zero Speed Threshold* (03.005).

Parameter				10.004 Running At Or Below Minimum Speed			
Short description				Indicates that the drive is running at or below the minimum speed			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default				Units			
Type		1 Bit Volatile		Update Rate		Background write	
Display Format		Standard		Decimal Places		0	
Coding				RO, ND, NC, PT			

If *Bipolar Reference Enable* (01.010) = 1 then *Running At Or Below Minimum Speed* (10.004) operates in the same way as *Zero Speed* (10.003). If *Bipolar Reference Enable* (01.010) = 0 then *Running At Or Below Minimum Speed* (10.004) is set if the following conditions are true:

$Post\ Ramp\ Reference\ (02.001) \leq Minimum\ Reference\ Clamp\ (01.007) + 0.5Hz$

If motor map 2 is active then *M2 Minimum Reference Clamp* (21.002) is used instead of *Minimum Reference Clamp* (01.007).

Parameter				10.005 Below Set Speed			
Short description				Indicates that the drive is running below the set speed			
Mode				Open-Loop			
Minimum		0		Maximum		1	
Default				Units			
Type		1 Bit Volatile		Update Rate		Background write	
Display Format		Standard		Decimal Places		0	
Coding				RO, ND, NC, PT			

See *At Speed Lower Limit* (03.006).

Parameter	10.006 <i>At Speed</i>		
Short description	Indicates that the drive is running at the set speed		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *At Speed Lower Limit* (03.006).

Parameter	10.007 <i>Above Set Speed</i>		
Short description	Indicates that the drive is running above the set speed		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *At Speed Lower Limit* (03.006).

Parameter	10.008 <i>Rated Load Reached</i>		
Short description	Indicates that rated load has been reached		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Rated Load Reached (10.008) is set to one when the torque producing current is at or above its rated level. This condition is detected when the modulus of *Percentage Load* (04.020) is greater or equal to 100.0%. It should be noted that this is an indication based on the level of current and not torque, which means that if field weakening is active a value of one in *Rated Load Reached* (10.008) does not necessarily mean that the motor is producing rated torque.

Parameter	10.009 <i>Current Limit Active</i>		
Short description	Indicates that the current limit is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Current Limit Active (10.009) is set to one if the current limit is active. It should be noted that the current limit system is used in RFC-A and RFC-S modes when standard ramp control is active (*Ramp Mode* (02.004)), or supply loss control is in ramp stop or limit stop mode (*Supply Loss Mode* (06.003)). Therefore *Current Limit Active* (10.009) is likely to change to one under these conditions, even if the user defined current limits are not active.

Parameter	10.010 <i>Regenerating</i>		
Short description	Indicates that power is being transferred from the motor to the drive		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Regenerating (10.010) is set to one if power is being transferred from the motor to the drive.

Parameter	10.011 <i>Braking IGBT Active</i>		
Short description	Indicates that the braking IGBT is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Braking IGBT Active (10.011) is set to one if the braking IGBT is active. As the braking IGBT active periods may be short, each time the braking IGBT is switched on *Braking IGBT Active* (10.011) is set to one and remains at one for at least 0.5s.

Parameter	10.012 <i>Braking Resistor Alarm</i>		
Short description	Indicates that the braking IGBT is active and the braking resistor thermal accumulator is greater than 75%		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Braking Resistor Alarm (10.012) is set when the braking IGBT is active and *Braking Resistor Thermal Accumulator* (10.039) is greater than 75.0%. As the braking IGBT on periods may be short *Braking Resistor Alarm* (10.012) is always held on for at least 0.5s.

Parameter	10.013 <i>Reverse Direction Commanded</i>		
Short description	Indicates that the reverse direction has been commanded		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Reverse Direction Commanded (10.013) indicates the reference direction at the input to the ramp system. If the *Pre-ramp Reference* (01.003) is negative *Reverse Direction Commanded* (10.013) is one otherwise *Reverse Direction Commanded* (10.013) is zero.

Parameter	10.014 <i>Reverse Direction Running</i>		
Short description	Indicates that the drive is running in the reverse direction		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

In Open-loop mode *Reverse Direction Running* (10.014) is set to one if the *Post Ramp Reference* (02.001) is negative otherwise it is set to zero.

Parameter	10.015 <i>Supply Loss</i>		
Short description	Indicates that the drive is in the supply loss state		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Supply Loss (10.015) indicates that the drive is in the supply loss state. This condition can only occur if supply loss detection is enabled, i.e. *Supply Loss Mode* (06.003) is set to a non-zero value. In the supply loss state the drive will attempt to stop the motor.

Parameter	10.016 Under Voltage Active		
Short description	Indicates that the drive is in the under voltage state		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Under Voltage Active (10.016) indicates that the drive is in the under voltage state. See *Standard Under Voltage Threshold* (06.065) for more details.

Parameter	10.017 Motor Overload Alarm		
Short description	Indicates that the motor overload accumulator is above 75% and the output current is high		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Motor Overload Alarm (10.017) is set if the drive output current is higher than the level that will eventually cause a *Motor Too Hot* trip and the *Motor Protection Accumulator* (04.019) is higher than 75.0%. See *Motor Thermal Time Constant 1* (04.015) for more details.

Parameter	10.018 Drive Over-temperature Alarm		
Short description	Indicates that the drive over-temperature alarm is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Drive Over-temperature Alarm (10.018) is set if *Percentage Of Drive Thermal Trip Level* (07.036) is greater than 90%.

Parameter	10.019 Drive Warning		
Short description	Indicates that one or more of the drive warning alarms are active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Drive Warning (10.019) is set to one if any of the drive warnings is active, and is defined as:

Drive Warning (10.019) = *Braking Resistor Alarm* (10.012) OR *Motor Overload Alarm* (10.017) OR *Drive Over-temperature Alarm* (10.018) OR *Low Load Detected Alarm* (10.062)

Parameter	10.020 Trip 0		
Short description	Shows the current or last trip to have occurred		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU

Trip 0 (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is the

oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost. The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

Trip categories and priorities

Trips are grouped into the categories given in the table below. A trip can only occur when the drive is not tripped, or if it is already tripped and the new trip has a higher priority than the active trip (i.e. lower priority number). Unless otherwise stated a trip cannot be reset until 1.0s after it has been initiated.

Priority	Category	Trips	Comments
1	Internal faults	<i>HF01 – HF20</i>	These are fatal problems that cannot be reset. All drive features are inactive after any of these trips occur. If a basic keypad is fitted it will show the trip, but the keypad will not function. These trips are not stored in the trip log.
1	Stored HF trip	<i>Stored HF</i>	This trip cannot be cleared unless 1299 is entered into <i>Parameter mm.000</i> (mm.000) and a reset is initiated.
2	Non-resettable trips	Trip numbers 218 to 247, <i>Slot1 HF</i> , <i>Slot2 HF</i> , <i>Slot3 HF</i> or <i>Slot4 HF</i>	These trips cannot be reset.
3	Volatile memory failure	<i>EEPROM Fail</i>	This can only be reset if <i>Parameter mm.000</i> (mm.000) is set to 1233 or 1244, or if <i>Load Defaults</i> (11.043) is set to a non-zero value.
4	Internal 24V power supply	<i>PSU 24V</i>	
5	Non-volatile media trips	Trip numbers 174, 175 and 177 to 188	These trips are priority 6 during power-up.
5	Position feedback interface power supply	<i>Encoder 1</i>	This trip can override <i>Encoder 2</i> to <i>Encoder 6</i> trips.
6	Trips with extended reset times	<i>OI ac</i> , <i>OI Brake</i> , and <i>OI dc</i>	These trips cannot be reset until 10s after the trip was initiated.
6	Phase loss and d.c. link power circuit protection	<i>Phase Loss</i> and <i>OHT dc bus</i>	The drive will attempt to stop the motor before tripping if a <i>Phase Loss.000</i> trip occurs unless this feature has been disabled (see <i>Action On Trip Detection</i> (10.037)). The drive will always attempt to stop the motor before tripping if an <i>OHT dc bus</i> occurs.
6	Standard trips	All other trips	

Internal faults

Trips {*HF01*} to {*HF20*} are internal faults that do not have trip numbers. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. The error can only be reset by powering the drive down and up again. The table below gives the reasons for internal faults and their corresponding trip.

Trip	Reason
{HF01}	CPU has detected an address error
{HF02}	CPU DMAC has detected an address error
{HF03}	CPU has detected an Illegal opcode
{HF04}	CPU has detected an Illegal slot instruction
{HF05}	An interrupt has occurred that does not have a defined function (Undefined exception)
{HF06}	An interrupt has occurred which is reserved (Reserved exception)
{HF07}	Watchdog failure
{HF08}	CPU Interrupt crash
{HF09}	Free store overflow
{HF10}	Parameter routing system error
{HF11}	Non-volatile memory comms error
{HF12}	Stack overflow. Sub-trip is shown to indicate which stack: 1 – background tasks 2 – timed tasks 3 – main system interrupts
{HF13}	The control hardware is not compatible with the firmware. The sub-trip number gives the actual ID code of the control board hardware.
{HF14}	CPU register bank error
{HF15}	CPU divide error
{HF16}	RTOS error (the background task has returned)
{HF17}	The clock supplied to the control board logic is out of specification
{HF18}	The internal flash memory has failed when writing option module parameter data. Sub-trip is shown to indicate which failure: 1 - Programming error while writing menu in flash 2 - Erase flash block containing setup menus failed 3 - Erase flash block containing application menus failed
{HF19}	Invalid main application firmware CRC. Reprogramming required.
{HF20}	The ASIC is not compatible with the firmware. The sub-trip number displayed is the ASIC version.
{HF23}	If this trip occurs please consult the drive supplier.
{HF24}	If this trip occurs please consult the drive supplier.
{HF25}	If this trip occurs please consult the drive supplier.

When the drive is subsequently powered up a *Stored HF* trip is initiated where the sub-trip number is the number of the HF trip that last occurred. This trip will occur at every power-up until it is reset. The trip can only be reset by first entering 1299 into *Parameter mm.000* (mm.000). If the drive is powered up and a *Stored HF* trip occurs, *Onboard User Program: Enable* (11.047) is reset to zero to prevent the on-board user program from running. This ensures that the user program can be changed or erased in case it causes an HF trip at every power-up. Once the *Stored HF* is cleared, it is necessary to power cycle the drive or to re-download the user program to allow the program to restart.

Similar trips that can be initiated by the control system or the power system

Trips shown in the table below can be generated either from the drive control system or from the power system. The sub-trip number which is in the form *xyzz* is used to identify the source of the trip. The digits *xx* are 00 for a trip generated by the control system or the number of a power module if generated by the power system. If the drive is not a multi-power module drive then *xx* will always have a value of 1 the trip is related to the power system. The *y* digit is used to identify the location of a trip which is generated by a rectifier module connected to a power module. Where the *y* digit is relevant it will have a value of 1 or more, otherwise it will be 0. The *zz* digits give the reason for the trip and are defined in each trip description.

Over Volts	Oht dc bus
OI ac	Phase Loss
OI Brake	Power Comms
PSU	OI Snubber
Oht Inverter	Cloning
Oht Power	Temp Feedback
Oht Control	Power Data

Braking IGBT

The list below gives conditions that will disable the braking IGBT:

1. *Braking IGBT Upper Threshold* (06.074) = 0, or *Low Voltage Braking IGBT Threshold Select* (06.076) = 1 and *Low Voltage Braking IGBT Threshold* (06.075) = 0.
2. The drive is in the under-voltage state.
3. A priority 1, 2 or 3 trip is active (see *Trip 0* (10.020)).
4. One of the following trips is active or would be active if another trip is not already active: *OI Brake*, *PSU*, *Th Brake Res* or *Oht Inverter*.
5. *Percentage Of Drive Thermal Trip Level* (07.036) = 100%. This is an indication that some part of the drive is too hot and is used to indicate if an internally fitted braking resistor is too hot.
6. *Brake R Too Hot* is active or the system has been set up to disable the braking IGBT based on the braking resistor temperature and the resistor is too hot (i.e. bit 2 of *Action On Trip Detection* (10.037) is set).

Note that the braking IGBT over-current trip cannot be reset until 10s after it is initiated. This period consists of a 9s period after the trip where the braking IGBT cannot be switched on again and the *OI Brake* trip is held active and cannot be reset. This 9s period is followed by the normal 1s delay, that is present for other trips, before the trip can be reset. During this 1s period it is possible for the braking IGBT to switch on again. If the conditions

are still present that caused the trip then the trip will be initiated again with a further 9s hold-off period etc.

Parameter	10.021 Trip 1		
Short description	Shows the 2nd from last trip to have occurred		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU

Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.030 Braking Resistor Rated Power		
Short description	Set to the rated power of the braking resistor		
Mode	Open-Loop		
Minimum	0.000	Maximum	99999.999
Default	0.000	Units	kW
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

A thermal protection system is provided for the braking resistor. If *Braking Resistor Rated Power* (10.030) is set to zero this protection system is disabled and the *Braking Resistor Thermal Accumulator* (10.039) is held at zero. If braking resistor thermal protection is required the *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061) should be set up with the braking resistor parameters. The thermal time constant of the resistor can be calculated from the single pulse energy rating (E) and continuous power rating (P) of the resistor.

$$\text{Braking Resistor Thermal Time Constant (10.031)} = \tau = E / P$$

The braking resistor is protected with a single time constant model as shown below.

The drive monitors the power flowing into the braking resistor and updates the *Braking Resistor Thermal Accumulator* (10.039). If bit 1 of *Action On Trip Detection* (10.037) = 0 and the accumulator reaches 100% an *Brake R Too Hot* trip is initiated. If bit 1 of *Action On Trip Detection* (10.037) = 1 and the accumulator reaches 100% the braking IGBT is disabled until the accumulator falls below 95.0%.

Parameter	10.031 <i>Braking Resistor Thermal Time Constant</i>		
Short description	Set to the thermal time constant of the braking resistor		
Mode	Open-Loop		
Minimum	0.000	Maximum	1500.000
Default	0.000	Units	s
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Braking Resistor Rated Power* (10.030).

Parameter	10.032 <i>External Trip</i>		
Short description	Set to initiate an external trip		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *External Trip* (10.032) is set to one an *External Trip.003* is initiated. A digital input can be routed to *External Trip* (10.032) to provide an external trip input function.

Parameter	10.033 <i>Drive Reset</i>		
Short description	Set to initiate a drive reset		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

A 0 to 1 transition in *Drive Reset* (10.033) causes a drive reset. If a drive reset terminal is required a digital input should be routed to *Drive Reset* (10.033).

Parameter	10.034 <i>Number Of Auto-reset Attempts</i>		
Short description	Set to the number of required auto-reset attempts		
Mode	Open-Loop		
Minimum	0	Maximum	6
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	1
2	2
3	3
4	4
5	5
6	Infinite

If *Number Of Auto-reset Attempts* (10.034) = 0 then no auto-reset attempts are made. Any other value will cause the drive to automatically reset following a trip for the number of times programmed after a delay defined by *Auto-reset Delay* (10.035) subject to the minimum reset time allowed for the type of trip. Note that for some trips the minimum is 10s. The auto-reset count is only incremented when the trip is the same as the previous trip otherwise it is reset to 0. When the auto-reset count reaches the programmed value, any further trip of the same value will not cause an auto-reset. If the number of auto-reset attempts defined by *Number Of Auto-reset Attempts* (10.034) has not been reached and there has been no trip for 5 minutes then the auto-reset count is cleared. Auto reset will not occur after any trips with priority levels 1, 2 or 3 as defined in *Trip 0* (10.020). When a manual reset occurs the auto-reset counter is reset to zero.

If *Number Of Auto-reset Attempts* (10.034) = 6 the auto-reset counter is held at zero, and so there is no limit on the number of auto-reset attempts.

Parameter	10.035 Auto-reset Delay		
Short description	Set to the required auto-reset delay		
Mode	Open-Loop		
Minimum	1.0	Maximum	600.0
Default	1.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *Number Of Auto-reset Attempts* (10.034).

Parameter	10.036 Auto-reset Hold Drive Healthy		
Short description	Set to hold drive healthy if further auto-reset attempts are possible		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Auto-reset Hold Drive Healthy* (10.036) = 0 then *Drive Healthy* (10.001) is cleared every time the drive trips regardless of any auto-reset that may occur. If *Auto-reset Hold Drive Healthy* (10.036) = 1 then *Drive Healthy* (10.001) is not cleared on a trip if any further auto-reset attempts are possible. Note that if the under voltage state becomes active *Drive Healthy* (10.001) will be set to zero unless *Hold Drive Healthy on Under Voltage* (10.068) = 1.

Parameter	10.037 Action On Trip Detection		
Short description	Defines the action of the drive on detection of a trip		
Mode	Open-Loop		
Minimum	0 (Display: 00000)	Maximum	31 (Display: 11111)
Default	0 (Display: 00000)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW		

The bits in *Action On Trip Detection* (10.037) are defined as follows:

Bit 0: Stop on defined non-important trips

If bit 0 is set to one the drive will attempt to stop before tripping if any of the following trip conditions are detected: *I/O Overload*, *An Input 1 Loss*, *An Input 2 Loss* or *Keypad Mode*. (This bit has no effect in Regen mode.)

Bit 1: Disable braking resistor overload detection

See *Braking Resistor Rated Power* (10.030).

Bit 2: Disable phase loss stop

Normally the drive will stop when the input phase loss condition is detected. If this bit is set to 1 the drive will continue to run and will only trip when the drive is brought to a stop by the user. (This bit has no effect in Regen mode.)

Bit 3: Not Used

Bit 4: Disable parameter freeze on trip

If this bit is 0 then the parameters listed below are frozen on trip until the trip is cleared. If this bit is 1 then this feature is disabled.

Open-loop mode	RFC-A or RFC-S modes	Regen
Reference Selected (01.001)	Reference Selected (01.001)	
Pre-skip Filter Reference (01.002)	Pre-skip Filter Reference (01.002)

Parameter	10.038 User Trip		
Short description	Can be used to generate a trip on the drive		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, BU		

When a value other than zero is written to the *User Trip* (10.038) the actions described in the following table are performed. The drive immediately writes the value back to zero. If the value is not included in the table, then the action is the same as if the trip with the same number (with sub-trip zero) occurred provided the drive is not already tripped.

Action	User Trip (10.038)
No action	Numbers corresponding to priority 1, 2 or 3 trips.
Drive reset	100
Clear trip logs (parameters 10.020 to 10.029, 10.041 to 10.060 and 10.070 to 10.079)	255

Parameter	10.039 Braking Resistor Thermal Accumulator		
Short description	Shows the level of the braking resistor thermal accumulator		
Mode	Open-Loop		
Minimum	0.0	Maximum	100.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

See *Braking Resistor Rated Power* (10.030).

Parameter	10.040 Status Word		
Short description	Shows the status word for the drive		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000000000)	Maximum	32767 (Display: 1111111111111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

The bits in *Status Word* (10.040) mirror the status bit parameters as shown below. Where the parameters do not exist in any mode the bit remains at zero.

Bit	Status parameter
0	Drive Healthy (10.001)
1	Drive Active (10.002)
2	Zero Speed (10.003)
3	Running At Or Below Minimum Speed (10.004)
4	Below Set Speed (10.005)
5	At Speed (10.006)
6	Above Set Speed (10.007)
7	Rated Load Reached (10.008)
8	Current Limit Active (10.009)
9	Regenerating (10.010)
10	Braking IGBT Active (10.011)
11	Braking Resistor Alarm (10.012)
12	Reverse Direction Commanded (10.013)
13	Reverse Direction Running (10.014)
14	Supply Loss (10.015)

Parameter	10.041 Trip 0 Date		
Short description	Shows the date at which trip 0 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See Trip 0 (10.020).

Parameter	10.042 Trip 0 Time		
Short description	Shows the time at which trip 0 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See Trip 0 (10.020).

Parameter	10.043 Trip 1 Date		
Short description	Shows the date at which trip 1 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See Trip 0 (10.020).

Parameter	10.044 Trip 1 Time		
Short description	Shows the time at which trip 1 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See Trip 0 (10.020).

Parameter	10.045 Trip 2 Date		
Short description	Shows the date at which trip 2 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.046 Trip 2 Time		
Short description	Shows the time at which trip 2 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.047 Trip 3 Date		
Short description	Shows the date at which trip 3 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.048 Trip 3 Time		
Short description	Shows the time at which trip 3 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.049 Trip 4 Date		
Short description	Shows the date at which trip 4 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.050 Trip 4 Time		
Short description	Shows the time at which trip 4 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.051 Trip 5 Date		
Short description	Shows the date at which trip 5 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.052 Trip 5 Time		
Short description	Shows the time at which trip 5 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.053 Trip 6 Date		
Short description	Shows the date at which trip 6 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.054 Trip 6 Time		
Short description	Shows the time at which trip 6 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.055 Trip 7 Date		
Short description	Shows the date at which trip 7 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.056 Trip 7 Time		
Short description	Shows the time at which trip 7 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.057 Trip 8 Date		
Short description	Shows the date at which trip 8 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.058 Trip 8 Time		
Short description	Shows the time at which trip 8 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.059 Trip 9 Date		
Short description	Shows the date at which trip 9 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.060 Trip 9 Time		
Short description	Shows the time at which trip 9 occurred		
Mode	Open-Loop		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.061 Braking Resistor Resistance		
Short description	Set the resistance value of the braking resistor		
Mode	Open-Loop		
Minimum	0.00	Maximum	10000.00
Default	0.00	Units	Ω
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Braking Resistor Rated Power* (10.030).

Parameter	10.063 Local Keypad Battery Low		
Short description	Indicates that the real time clock battery in the local keypad is low		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Local Keypad Battery Low (10.063) is set to one when a keypad is fitted to the front of the drive with an internal real-time clock and the battery is not fitted or the voltage is below the minimum threshold.

Parameter	10.064 Remote Keypad Battery Low		
Short description	Indicates that the real time clock battery in the remote keypad is low		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Remote Keypad Battery Low (10.064) is set to one when a keypad is connected to the drive user comms port with an internal real-time clock and the battery is not fitted or the voltage is below the minimum threshold.

Parameter	10.065 Auto-tune Active		
Short description	Indicates that an auto-tune sequence is active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Auto-tune Active (10.065) is set to one while an auto-tune sequence is active.

Parameter	10.066 Limit Switch Active		
Short description	Indicates that a limit switch is enabled and active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Limit Switch Active (10.066) is set to one when a limit switch is enabled and active.

Parameter	10.067 <i>Fire Mode Active</i>		
Short description	Indicates that fire mode is enabled and active		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Fire Mode Active (10.067) is set to one when fire mode is enabled and active.

Parameter	10.068 <i>Hold Drive Healthy on Under Voltage</i>		
Short description	Set to hold drive healthy if the drive is in the under voltage state		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Hold Drive Healthy on Under Voltage (10.068) can be used to hold the drive healthy active (*Drive Healthy* (10.001) = 1 and not flash the status LED on the front of the drive) when the drive is in the under voltage state (*Under Voltage Active* (10.016) = 1).

If *Hold Drive Healthy on Under Voltage* (10.068) = 0 and *Under Voltage Active* (10.016) = 1, then *Drive Healthy* (10.001) will be set to 0 and the status LED on the front of the drive will flash.

If *Hold Drive Healthy on Under Voltage* (10.068) = 1, *Under Voltage Active* (10.016) = 1 and the drive is not tripped (i.e. *Drive Status* (10.101) does not equal 9), then *Drive Healthy* (10.001) will be set to 1 and the status LED on the front of the drive will not flash.

If the drive is tripped then *Drive Healthy* (10.001) will be set to 0 and the status LED will flash independent of what *Hold Drive Healthy on Under Voltage* (10.068) is set to.

Parameter	10.069 <i>Additional Status Bits</i>		
Short description	Shows the additional status bits for the drive		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000)	Maximum	1023 (Display: 1111111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

The bits in *Additional Status Bits* (10.069) mirror the status bits parameters as shown below. Where the parameters do not exist in any mode the bit remains at zero.

Bit	Status parameter
0	<i>Under Voltage Active</i> (10.016)
1	<i>Motor Overload Alarm</i> (10.017) or <i>Inductor Overload Alarm</i> (10.017)
2	<i>Drive Over-temperature Alarm</i> (10.018)
3	<i>Drive Warning</i> (10.019)
4	<i>Low Load Detected Alarm</i> (10.062)
5	<i>Local Keypad Battery Low</i> (10.063)
6	<i>Remote Keypad Battery Low</i> (10.064)
7	<i>Auto-tune Active</i> (10.065)
8	<i>Limit Switch Active</i> (10.066)
9	<i>Fire Mode Active</i> (10.067)

Parameter	10.070 <i>Trip 0 Sub-trip Number</i>		
Short description	Shows the sub-trip number for trip 0		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.071 Trip 1 Sub-trip Number		
Short description	Shows the sub-trip number for trip 1		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.072 Trip 2 Sub-trip Number		
Short description	Shows the sub-trip number for trip 2		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.073 Trip 3 Sub-trip Number		
Short description	Shows the sub-trip number for trip 3		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.074 Trip 4 Sub-trip Number		
Short description	Shows the sub-trip number for trip 4		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.075 Trip 5 Sub-trip Number		
Short description	Shows the sub-trip number for trip 5		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.076 Trip 6 Sub-trip Number		
Short description	Shows the sub-trip number for trip 6		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.077 Trip 7 Sub-trip Number		
Short description	Shows the sub-trip number for trip 7		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.078 Trip 8 Sub-trip Number		
Short description	Shows the sub-trip number for trip 8		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.079 Trip 9 Sub-trip Number		
Short description	Shows the sub-trip number for trip 9		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.080 Stop Motor		
Short description	Indicates that the motor is being stopped before the drive trips		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

It is possible for some trips to cause the motor to stop before the trip is initiated (see *Action On Trip Detection* (10.037)). During the period while the motor is being stopped before the trip is initiated *Stop Motor* (10.080) is set to one. Once the motor stops *Stop Motor* (10.080) is set back to zero.

Parameter	10.081 Phase Loss		
Short description	Indicates that the drive has detected an input phase loss		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

If phase loss or imbalance is detected that would initiate a phase loss trip with sub-trip 0, i.e. *Phase Loss.000*, then *Phase Loss* (10.081) is set to one. Either the motor will be stopped and the drive tripped or the drive will continue to operate normally until the user stops the motor and the drive trips (see *Action On Trip Detection* (10.037)). In either case *Phase Loss* (10.081) is set to one when the phase loss condition is detected and remains set until the drive trips.

Parameter	10.082 <i>Miscellaneous Status Flags</i>		
Short description	Shows additional status flags		
Mode	Open-Loop		
Minimum	0 (Display: 0000000000000000)	Maximum	65535 (Display: 1111111111111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background Write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

This parameter provides miscellaneous status flags that are not included as individual parameters.

Open-loop and RFC-A mode:

All flags are unused.

RFC-S Mode:

Bit	Status Indication
0	Indicates when the motor torque limit is active. This is a limit defined by the motor parameters, <i>Rated Voltage</i> (05.009) and the frequency being applied to the motor. The drive attempts to prevent loss of control which would occur by exceeding the maximum torque limit of the motor by imposing a limit at a level slightly below the actual limit of the motor. This limit is only active if <i>Enable High Speed Mode</i> (05.022) is set to -2 or 2.
1-15	Unused.

Parameter	10.101 <i>Drive Status</i>		
Short description	Shows the present status of the drive		
Mode	Open-Loop		
Minimum	0	Maximum	16
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

Value	Text
0	Inhibit
1	Ready
2	Stop
3	Scan
4	Run
5	Supply Loss
6	Deceleration
7	dc Injection
8	Position
9	Trip
10	Active
11	Off
12	Hand
13	Auto
14	Heat
15	Under Voltage
16	Phasing

Drive Status (10.101) shows the present status of the drive. The strings from this parameter are also used by the basic keypad to provide the status display text.

Parameter	10.102 <i>Trip Reset Source</i>		
Short description	Indicates whether a trip in the trip log has been reset.		
Mode	Open-Loop		
Minimum	0	Maximum	1023
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The bits in *Trip Reset Source* (10.102) correspond to each of the trips in the trip log (i.e. bit 0 corresponds to trip 0, bit 1 corresponds to trip 1, etc.).

When a trip occurs, bit 0 is set to one and the other bits corresponding to the trips already in the trip log are shifted left one bit. If the trip is reset then bit 0 is set back to zero, otherwise if a higher priority trip occurs bit 0 is shifted left by one bit. The result is that each of the bits in *Trip Reset Source* (10.102) show whether trips in the trip log were reset or moved up the trip log by a higher priority trip.

Parameter	10.103 Trip Time Identifier		
Short description	Shows time in milliseconds since the drive powered up when a trip occurred		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	ms
Type	32 Bit Volatile	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

When a trip occurs the time in milliseconds since the drive powered up is stored in *Trip Time Identifier* (10.103). The time rolls-over when it reaches $2^{31} - 1$, but if the time is 0 a value of 1 is written. *Trip Time Identifier* (10.103) can be used to determine when a new trip has occurred as the value will change (unless there were exactly 2^{32} ms between trips) and will be non-zero.

Parameter	10.104 Active Alarm		
Short description	Shows the value of the active alarm		
Mode	Open-Loop		
Minimum	0	Maximum	12
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

Value	Text
0	None
1	Brake Resistor
2	Motor Overload
3	Ind Overload
4	Drive Overload
5	Auto Tune
6	Limit Switch
7	Fire Mode
8	Low Load
9	Option Slot 1
10	Option Slot 2
11	Option Slot 3
12	Option Slot 4

If there is no alarm then *Active Alarm* (10.104) = 0. If one alarm is active then *Active Alarm* (10.104) shows the value of the alarm. If more than one alarm is active then *Active Alarm* (10.104) shows the active alarm with the lowest value. The strings from this parameter are also used by the basic keypad to provide the status display text except for option slot warnings where the option module may supply the string.

Parameter	10.105 Hand Off Auto State		
Short description	Shows the state of the hand/off/auto system		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	Not Active
1	Off
2	Hand
3	Auto

See *Hand/Off/Auto Operating Mode* (01.052) for details of the hand/off/auto system. *Hand Off Auto State* (10.105) shows the state of this system and is used at power-up to restore the previous state if required.

Parameter	10.106 Potential Drive Damage Conditions		
Short description	Indicates that the user has put the drive in a condition that could potentially damage the drive		
Mode	Open-Loop		
Minimum	0 (Display: 0000)	Maximum	15 (Display: 1111)
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The bits in **Potential Drive Damage Conditions (10.106)** are set under the conditions shown in the table below to indicate that the user has put the drive in a condition that could potentially damage the drive. The bits in this parameter cannot be cleared by users.

Potential Drive Damage Conditions (10.106) bit	Condition
0	Fire mode has been active. See <i>Fire Mode Reference</i> (01.053).
1	<i>Low Under Voltage Threshold</i> (06.066) has been reduced from its default value.
2	High speed RFC-S mode has been used. See <i>Enable High Speed Mode</i> (05.022).
3	Not used.

Parameter	10.107 Auto-tune State		
Short description	Shows progress through auto-tuning		
Mode	Open-Loop		
Minimum	0	Maximum	9
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	Not Active
1	Resistance
2	pLs
3	Ls
4	Flux
5	Flux Repeat
6	Ld Lq No-load
7	Lq
8	Ke
9	Inertia

Auto-tune State (10.107) is zero unless an auto-tune is active when it shows the current state of the auto-tune sequence as follows:

Parameter value	Auto-tune state
1	Stator resistance measurement
2	Transient inductance measurement
3	Stator inductance measurement

Menu 11 Single Line Descriptions – *Miscellaneous*

Menu 11 – Miscellaneous

Mode: Open-Loop

Menu 11 provides parameters for the following features:

1. General drive set-up and identification
2. Serial communications interface
3. Non-volatile media card access
4. Onboard user programming

Non-Volatile Media Card Support

The drive supports two types of non-volatile media cards; smart cards and FAT formatted SD cards.

The NV Media Card can be used for:

- Parameter copying between drives
- Saving drive parameter sets
- Saving an onboard user program
- Storing of onboard scope data (SD card only)

The NV Media Card can be used to store drive parameter sets and/or PLC programs set from the drive in data blocks 001 to 499 on the card.

The Unidrive M is compatible with a Unidrive SP smart card and is able to read and translate the Unidrive SP parameter set into a compatible parameter set for Unidrive M. This is only possible if the Unidrive SP parameter set was transferred to the smart card using the difference from defaults transfer method (i.e. 4yyy transfer). The Unidrive M is not able to read any other type of Unidrive SP data block on the card. Although it is possible to transfer difference from default data blocks from a Unidrive SP into the Unidrive M, the following should be noted:

1. If a parameter from the source drive does not exist in the target drive then no data is transferred for that parameter.
2. If the data for the parameter in the target drive is out of range then the data is limited to the range of the target parameter.
3. If the target drive has a different rating to the source drive then the normal rules for this type of transfer apply.

SD Card File system layout

The folder <MCDF/> ("Motor Control Data Files") must be present on a FAT-formatted SD card. Other folders can be added, but this folder and its contents must not be altered. This folder structure is created when a *Card Error* trip is reset. The drive will place files in a <MCDF/> folder in the card root. When individual items are saved by the drive (e.g. drive parameters or a user program), this will generate a numbered file in the root of this folder; the number is that specified in the triggering command, and this number must be specified in the command used to restore the item from the file. This is equivalent functionality to that provided on a smart card. When saving a parameter file, in addition to the drive parameters, the drive will also read the option parameters from each of the installed options, and include those that have changed in the parameter file.

Changing the drive mode

If the source drive mode is different from the target drive mode then the mode will be changed to the source drive mode before the parameters are transferred. If the required drive mode is outside the allowed range for the target then a *Card Drive Mode* trip is initiated and no data is transferred.

Different voltage ratings

If the voltage rating of the source and target drives is different then all parameters except those that are rating dependent are transferred to the target drive. The rating dependent parameters are left at their default values. After the parameters have been transferred and saved to non-volatile memory a *Card Rating* trip is given as a warning. The table below gives a list of the rating dependent parameters.

Parameters
Standard Ramp Voltage (02.008)
Voltage Set-point (03.005)
Reactive Power Input kVAR (03.020)
Regen Supply Loss a.c. Level (03.023)
Regen Minimum Voltage (03.026)
Regen Maximum Voltage (03.027)
Supply Voltage (03.028)
Motoring Current Limit / Power From Supply Current Limit (04.005)
M2 Motoring Current Limit / M2 Power From Supply Current Limit (21.027)
Regenerating Current Limit / Power To Supply Current Limit (04.006)
M2 Regenerating Current Limit / M2 Power To Supply Current Limit (21.028)
Symmetrical Current Limit (04.007)
M2 Symmetrical Current Limit (21.029)
User Current Maximum Scaling (04.024)
Rated Current (05.007)
M2 Rated Current (21.007)
Rated Voltage (05.009)
M2 Rated Voltage (21.009)
Rated Power Factor (05.010)
M2 Rated Power Factor (21.010)
Stator Resistance (05.017)
M2 Stator Resistance (21.012)
Maximum Switching Frequency (05.018)
Transient Inductance /Ld (05.024)
M2 Transient Inductance /Ld (21.014)
Stator Inductance (05.025)
M2 Stator Inductance (21.024)
No-load Lq (05.068)
M2 No-load Lq (21.041)
Rated Load Lq (05.069)
M2 Rated Load Lq (21.042)
No-load Phase Offset (05.070)
M2 No-load Phase Offset (21.043)
Rated Load Phase Offset (05.071)
M2 Rated Load Phase Offset (21.044)
Maximum Low Speed Sensorless Mode Current (05.072)
M2 Maximum Low Speed Sensorless Mode Current (05.045)
Injection Braking Level (06.006)
Supply Loss Detection Level (06.048)
Braking IGBT Lower Threshold (06.073)
Braking IGBT Upper Threshold (06.074)
Low Voltage Braking IGBT Threshold (06.075)

Different option modules fitted

If the *Option ID Code* (MM.001) is different for any option module fitted to the source drive compared to the destination drive then the parameters for the set-up and application menus for that option module are not transferred, but the parameters are set to their default values. After the parameters have been transferred and saved to non-volatile memory a {Card Option} trip is given as a warning

Different current ratings

If any of the current rating parameters (*Maximum Heavy Duty Rating* (11.032), *Maximum Rated Current* (11.060) or *Full Scale Current Kc* (11.061)) are different between the source and target then all parameters are still written to the target drive, but some may be limited by their allowed range. To give similar performance in the target compared to the source drive the speed and current controller gains are modified as shown below.

Gains	Multiplier
Speed Controller Proportional Gain Kp1 (03.010) Speed Controller Integral Gain Ki1 (03.011) Speed Controller Proportional Gain Kp2 (03.013) Speed Controller Integral Gain Ki2 (03.014)	[Source Full Scale Current Kc (11.061)] / [Target Full Scale Current Kc (11.061)]
M2 Speed Controller Proportional Gain Kp (21.017) M2 Speed Controller Integral Gain Ki (21.018)	
Current Controller Kp Gain (04.013) Current Controller Ki Gain (04.014)	[Target Full Scale Current Kc (11.061)] / [Source Full Scale Current Kc (11.061)]
M2 Current Controller Kp Gain (21.022) M2 Current Controller Ki Gain (21.023)	

Different variable maximums

It should be noted that if ratings of the source and target drives are different, or the option modules fitted to the source and target drives are different, it is possible that some parameters with variable maximums may be limited and not have the same values as in the source drive.

Macro files

Macro files are created in the same way as parameter files except that *NV Media Card Create Special File* (11.072) must be set to 1 before the file is created on the NV media card. *NV Media Card Create Special File* (11.072) is set to zero after the file has been created or the transfer fails. When a macro file is transferred to a drive the drive mode is not changed even if the actual mode is different to that in the file and defaults are not loaded before the parameters are copied from the file to the drive. The first three identification bytes at the start of a macro file are "MAC".

Onboard user program files

Onboard user program files are created with *Parameter mm.000* (mm.000) = 5xxx and the onboard user program image is transferred to the NV media card. The onboard user program image can be loaded from an onboard user program file with *Parameter mm.000* (mm.000) = 6xxx. If the drive does not have an onboard user program loaded when the onboard user program file is created then a file is created with an empty image. If this file is then transferred to a drive with an onboard user program loaded, the onboard user program will be erased.

Option module applications file

An option module applications file is intended to hold user program from an applications module. An option module applications file from the option module in slot 1 can be created with *Parameter mm.000* (mm.000) = 15xxx. An option module applications file can be transferred from an option module in slot 1 to an option module applications file with *Parameter mm.000* (mm.000) = 18xxx. If the transfer fails because the option module does not respond correctly a *Card Slot* trip is initiated where the sub-trip number is 1 (i.e. the option module slot number). Transfer to and from other option slots are initiated with other codes in *Parameter mm.000* (mm.000) as defined previously.

Parameter	11.001 Option Synchronisation Select		
Short description	Option Synchronisation Select		
Mode	Open-Loop		
Minimum	0	Maximum	5
Default	3	Units	
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Active
1	Slot 1
2	Slot 2
3	Slot 3
5	Automatic

Option Synchronisation Select (11.001) is used to select and enable timing synchronisation between the communications system associated with an option module fitted to the drive and the drive control system. If "Not Active" is selected then the drive control system operates using its own processor crystal for control sample timing. If one of the option modules is selected and is making a request to provide synchronisation then the drive control sample timing will be synchronised to the communication system. *Option synchronisation Active* (11.002) shows the synchronisation source, where "Not Active" indicates that the drive is providing the timing for the control system. Any other value indicates if an option module is providing synchronisation. If required the synchronisation source can be selected automatically by setting *Option Synchronisation Select* (11.001) to "Automatic". In this case the option module in the lowest numbered slot that is making a request to provide synchronisation will be selected.

Parameter	11.002 Option synchronisation Active		
Short description	Option synchronisation Active		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default		Units	
Type	8 Bit Volatile	Update Rate	Background Write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	Not Active
1	Slot 1
2	Slot 2
3	Slot 3
4	Slot 4

See *Option Synchronisation Select* (11.001).

Parameter	11.017 Keypad Defined Node Address		
Short description	Value that can be set up by some keypads to define the comms node address		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, NC, PT		

Keypad Defined Node Address (11.017) can be set up by some keypads and is intended to define a comms node address. As such it can be used to set the node address for the drive 485 serial comms. If the value of *Keypad Defined Node Address* (11.017) is between 1 and 247 and is different from *Serial Address* (11.023) then the value is copied to *Serial Address* (11.023) and *Reset Serial Communications* (11.020) is set to one. This has the effect of setting the 485 serial comms node address to the value defined by the keypad and re-initialising the comms system so that the new node address takes effect. As this is a power-down save parameter, once it is set to a value between 1 and 247 it will continue to over-ride the user serial port address unless it is changed again by a keypad.

Parameter	11.018 Status Mode Parameter 1		
Short description	Defines the parameter displayed on the upper row of the keypad when in status mode		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter Displayed At Power-up* (11.022).

Parameter	11.019 Status Mode Parameter 2		
Short description	Defines the parameter displayed on the lower row of the keypad when in status mode		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter Displayed At Power-up* (11.022).

Parameter	11.020 Reset Serial Communications		
Short description	Set to one to update communications set-up		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC		

When *Serial Address* (11.023), *Serial Mode* (11.024), *Serial Baud Rate* (11.025), *Minimum Comms Transmit Delay* (11.026) or *Silent Period* (11.027) are modified the changes do not have an immediate effect on the serial communications system. The new values are used after the next power-up or if *Reset Serial Communications* (11.020) is set to one. *Reset Serial Communications* (11.020) is automatically cleared to zero after the communications system is updated.

Parameter	11.021 Parameter 00.030 Scaling		
Short description	Defines the scaling for Pr 00.030		
Mode	Open-Loop		
Minimum	0.000	Maximum	10.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

Parameter 00.030 Scaling (11.021) defines the scaling applied to parameter 00.030 when it is displayed on a basic keypad. The scaling is only applied in the status and view modes. If the parameter is edited via the keypad it reverts to its unscaled value during editing.

Parameter	11.022 Parameter Displayed At Power-up		
Short description	Defines which parameter is displayed at power-up		
Mode	Open-Loop		
Minimum	0.000	Maximum	0.080
Default	0.010	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT		

If *Status Mode Parameter 1* (11.018) and *Status Mode Parameter 2* (11.019) are set to zero, then *Parameter Displayed At Power-up* (11.022) defines which Menu 0 parameter is initially displayed at power-up. If *Status Mode Parameter 1* (11.018) or *Status Mode Parameter 2* (11.019) are set to valid parameter numbers, then *Parameter Displayed At Power-up* (11.022) defines the active parameter at power-up, i.e. the parameter first displayed when going in to parameter view mode on the keypad. *Status Mode Parameter 1* (11.018) and *Status Mode Parameter 2* (11.019) define the parameter values to be displayed on the upper and lower rows of the keypad respectively, when in status mode. If only one of these parameters is set correctly the other row will display the value of the current active parameter. If both *Status Mode Parameter 1* (11.018) and *Status Mode Parameter 2* (11.019) are set to the same parameter number then the parameter value is displayed as double height characters.

Parameter	11.023 Serial Address		
Short description	Defines the serial address of the drive		
Mode	Open-Loop		
Minimum	1	Maximum	247
Default	1	Units	
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Serial Address (11.023) defines the node address for the serial comms interface in the range from 1 to 247.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.024 Serial Mode		
Short description	Defines the serial mode of the drive		
Mode	Open-Loop		
Minimum	0	Maximum	15
Default	0	Units	
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	8 2 NP
1	8 1 NP
2	8 1 EP
3	8 1 OP
4	8 2 NP M
5	8 1 NP M
6	8 1 EP M
7	8 1 OP M
8	7 2 NP
9	7 1 NP
10	7 1 EP
11	7 1 OP
12	7 2 NP M
13	7 1 NP M
14	7 1 EP M
15	7 1 OP M

The core drive always uses the Modbus rtu protocol and is always a slave. *Serial Mode* (11.024) defines the data format used by the serial comms interface. The bits in the value of *Serial Mode* (11.024) define the data format as follows. Bit 3 is always 0 in the core product as 8 data bits are required for Modbus rtu. The parameter value can be extended in derivative products which provide alternative communications protocols if required.

Bits	3	2	1 and 0
Format	Number of data bits 0 = 8 bits 1 = 7 bits	Register mode 0 = Standard 1 = Modified	Stop bits and Parity 0 = 2 stop bits, no parity 1 = 1 stop bit, no parity 2 = 1 stop bit, even parity 3 = 1 stop bit, odd parity

Bit 2 selects either standard or modified register mode. The menu and parameter numbers are derived for each mode as given in the table below. Standard mode is compatible with Unidrive SP. Modified mode is provided to allow register numbers up to 255 to be addressed. If any menus with numbers above 63 should contain more than 99 parameters, then these parameters cannot be accessed via Modbus rtu.

Register mode	Register address
Standard	(mm x 100) + ppp - 1 where mm ≤ 162 and ppp ≤ 99
Modified	(mm x 256) + ppp - 1 where mm ≤ 63 and ppp ≤ 255

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.025 Serial Baud Rate		
Short description	Defines the serial baud rate of the drive		
Mode	Open-Loop		
Minimum	0	Maximum	10
Default	6	Units	
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	300
1	600
2	1200
3	2400
4	4800
5	9600
6	19200
7	38400
8	57600
9	76800
10	115200

Serial Baud Rate (11.025) defines the baud rate used by the serial comms interface.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.026 Minimum Comms Transmit Delay		
Short description	Defines the minimum delay between the host and drive		
Mode	Open-Loop		
Minimum	0	Maximum	250
Default	2	Units	ms
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

There will always be a finite delay between the end of a message from the host (master) and the time at which the host is ready to receive the response from the drive (slave). The drive does not respond until at least 1ms after the message has been received from the host allowing 1ms for the host to change from transmit to receive mode. This initial delay can be extended using *Minimum Comms Transmit Delay* (11.026) if required.

Minimum Comms Transmit Delay (11.026)	Action
0	The transmitters are turned on and data transmission begins immediately after the initial delay (≥1ms)
1	The transmitters are turned on after the initial delay (≥1ms) and data transmission begins 1ms later
2 or more	The transmitters are turned on after a delay of at least the time specified by <i>Minimum Comms Transmit Delay</i> (11.026) and data transmission begins 1ms later

The drive holds its own transmitters active for up to 1ms after it has transmitted data before switching to the receive mode; the host should not send any data during this time.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.027 <i>Silent Period</i>		
Short description	Defines the idle time required to detect the end of a received data message		
Mode	Open-Loop		
Minimum	0	Maximum	250
Default	0	Units	ms
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

The silent period defines the idle time required to detect the end of a received data message. If *Silent Period* (11.027) = 0 then the silent period is at least 3.5 characters at the selected baud rate. This is the standard silent period for Modbus rtu. If *Silent Period* (11.027) is non-zero it defines the minimum silent period in milliseconds.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.028 <i>Drive Derivative</i>		
Short description	Displays the drive derivative identifier		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Drive Derivative (11.028) shows the derivative identifier.

Parameter	11.029 <i>Software Version</i>		
Short description	Displays the software version in the drive		
Mode	Open-Loop		
Minimum	0	Maximum	99999999
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Version	Decimal Places	0
Coding	RO, ND, NC, PT		

Software Version (11.029) displays the drive software version number as a decimal number wwxxyyzz. A keypad will display the value in this parameter as ww.xx.yy.zz.

Parameter	11.030 <i>User Security Code</i>		
Short description	Defines the user security code of the drive		
Mode	Open-Loop		
Minimum	0	Maximum	2147483647
Default		Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, PT		

See *User Security Status* (11.044).

Parameter	11.031 <i>User Drive Mode</i>		
Short description	Defines the mode of the drive		
Mode	Open-Loop		
Minimum	1	Maximum	4
Default		Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE, ND, NC, PT		

Value	Text
1	Open-loop
2	RFC-A
3	RFC-S
4	Regen

User Drive Mode (11.031) is set to the current drive mode at power-up. The user can change the drive mode as follows:

1. Set *Parameter mm.000* (mm.000) to 1253, 1254, 1255 or 1256
2. Change *User Drive Mode* (11.031) to the required mode

3. Initiate a drive reset

Provided *Drive Active* (10.002) = 0 the drive will change to the new drive mode, and then load and save parameters to non-volatile memory. If *Parameter mm.000* (mm.000) is not set to one of the specified values then the drive mode does not change on drive reset. The value in *Parameter mm.000* (mm.000) determines which defaults are loaded as follows.

Parameter mm.000 (mm.000)	Defaults loaded
1253	50Hz defaults to all menus
1254	60Hz defaults to all menus
1255	50Hz defaults to all menus except 15 to 20 and 24 to 28
1256	60Hz defaults to all menus except 15 to 20 and 24 to 28

Parameter	11.032 Maximum Heavy Duty Rating		
Short description	Displays the maximum heavy duty current rating of the drive		
Mode	Open-Loop		
Minimum	0.000	Maximum	99999.999
Default		Units	A
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	3
Coding	RO, ND, NC, PT		

Maximum Heavy Duty Rating (11.032) defines the maximum setting for *Rated Current* (05.007) that gives heavy duty operation. If *Maximum Heavy Duty Rating* (11.032) = 0.000 then heavy duty operation is not possible. If *Maximum Heavy Duty Rating* (11.032) = VM_RATED_CURRENT[MAX] then normal duty operation is not possible.

Parameter	11.033 Drive Rated Voltage		
Short description	Displays the voltage rating of the drive		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	200V
1	400V
2	575V
3	690V

Drive Rated Voltage (11.033) shows the voltage rating of the drive.

Parameter	11.034 Software Sub-version		
Short description	Software Sub-version		
Mode	Open-Loop		
Minimum	0	Maximum	99
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up Write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

For legacy applications *Software Sub-version* (11.034) shows the yy part of *Software Version* (11.029).

Parameter	11.036 NV Media Card File Previously Loaded		
Short description	Displays the number of the last parameter file transferred from an NV Media Card to the drive		
Mode	Open-Loop		
Minimum	0	Maximum	999
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, NC, PT		

NV Media Card File Previously Loaded (11.036) shows the number of the last parameter file transferred from an NV Media Card to the drive. If defaults are subsequently reloaded *NV Media Card File Previously Loaded* (11.036) is set to 0.

Parameter	11.037 NV Media Card File Number		
Short description	Selects a file by its file identification number		
Mode	Open-Loop		
Minimum	0	Maximum	999
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

NV Media Card File Number (11.037) is used to select a file by its file identification number. When NV Media Card File Number (11.037) corresponds to the number of a file the following data about the file is shown.

Parameter
NV Media Card File Type (11.038)
NV Media Card File Version (11.039)
NV Media Card File Checksum (11.040)

The actions of erasing a card, erasing a file, creating a new file, changing a Menu 0 parameter or removing a card resets NV Media Card File Number (11.037) to 0.

Parameter	11.038 NV Media Card File Type		
Short description	Displays the file type of the file selected		
Mode	Open-Loop		
Minimum	0	Maximum	5
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Open-loop
2	RFC-A
3	RFC-S
4	Regen
5	User Prog

NV Media Card File Type (11.038) shows the file type of the file selected with NV Media Card File Number (11.037) as shown in the table below.

NV Media Card File Type (11.038)	File
0	No file selected
1	Open-loop mode parameter file
2	RFC-A mode parameter file
3	RFC-S mode parameter file
4	Regen mode parameter file
5	Onboard user program file

Parameter	11.039 NV Media Card File Version		
Short description	Displays the version number stored with the file selected		
Mode	Open-Loop		
Minimum	0	Maximum	9999
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

NV Media Card File Version (11.039) shows the version number stored with the file selected with NV Media Card File Number (11.037).

To set a file version number on a NV media card, the number required must be set in NV Media Card File Required Version (11.077) and then the data must be written to the NV media card. Failure to do this will result in no version number being displayed when selecting the NV media card file number in NV Media Card File Number (11.037).

Parameter	11.040 NV Media Card File Checksum		
Short description	Displays the checksum from the file selected		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

NV Media Card File Checksum (11.040) shows the checksum from the file selected with *NV Media Card File Number* (11.037). If the media file is a Unidrive SP SMARTCARD file, the checksum is the sum of all bytes except the checksum modulo 65536. If the file was generated by a Unidrive M, a value of zero will be displayed.

Parameter	11.042 Parameter Cloning		
Short description	Can be used to initiate a data transfer to or from an NV media card		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RW, TE, NC		

Value	Text
0	None
1	Read
2	Program
3	Auto
4	Boot

* Only a value of 3 or 4 in this parameter is saved.

Parameter Cloning (11.042) can also be used to initiate data transfer to or from an NV media card as described below for each possible value of this parameter.

1: Read

Provided a parameter file with file identification number 1 exists on the NV media card then setting *Parameter Cloning* (11.042) = 1 and initiating a drive reset will transfer the parameter data to the drive (i.e. the same action as writing 6001 to *Parameter mm.000* (mm.000)). When the action is complete *Parameter Cloning* (11.042) is automatically reset to zero.

2: Program

Setting *Parameter Cloning* (11.042) = 2 and initiating a drive reset will transfer the parameter data from the drive to a parameter file with file identification number 1. This is the same action as writing 4001 to *Parameter mm.000* (mm.000) except that the file will be overwritten if it already exists. When the action is complete *Parameter Cloning* (11.042) is automatically reset to zero.

3: Auto

Setting *Parameter Cloning* (11.042) = 3 and initiating a drive reset will transfer the parameter data from the drive to a parameter file with file identification number 1. This is the same action as writing 4001 to *Parameter mm.000* (mm.000) except that the file will be overwritten if it already exists. When the action is complete *Parameter Cloning* (11.042) remains at 3. It should be noted that if the drive is to remain in Auto mode after power-down and subsequent power-up a parameter save is required, unless *Parameter Cloning* (11.042) is being accessed from Menu 0, in which case it will be saved automatically.

If the card is removed when *Parameter Cloning* (11.042) = 3, then *Parameter Cloning* (11.042) is set to 0, which forces the user to change *Parameter Cloning* (11.042) back to 3 if auto mode is still required. The user will need to set *Parameter Cloning* (11.042) = 3 and initiate a drive reset to write the complete parameter set to the new card.

When a parameter in Menu zero is changed via the keypad and *Parameter Cloning* (11.042) = 3 the parameter is saved both to the drive non-volatile memory and to the parameter file with identification number 1 on the card. Only the new value of the modified parameter, and not the value of all the other drive parameters, is stored each time. If the drive did not automatically clear *Parameter Cloning* (11.042) when a card is removed, then when a new card is inserted that contains a parameter file with identification number 1 the modified parameter would be written to the existing file on the new card and the rest of the parameters in this file may not be the same as those in the drive.

When *Parameter Cloning* (11.042) = 3 and the drive parameters are saved to non-volatile memory, the file on the card is also updated, therefore this file becomes a copy of the drive parameters. At power up, if *Parameter Cloning* (11.042) = 3, the drive will save its complete parameter set to the card. This is done to ensure that if a card is inserted whilst the drive is powered down the new card will have the correct data after the drive is powered up again.

4: Boot

When *Parameter Cloning* (11.042) = 4 the drive operates in a similar way to *Parameter Cloning* (11.042) = 3 and automatically creates a copy of its parameters on the NV Media card. The NC (not clonable) attribute for *Parameter Cloning* (11.042) is 1, and so it does not have a value stored in the parameter file on the card in the normal way. However, the value of *Parameter Cloning* (11.042) is held in the parameter file header. If *Parameter Cloning* (11.042) = 4 in the parameter file with a file identification value of 1 on an NV media card fitted to a drive at power-up then the parameters from the parameter file with file identification number 1 are transferred to the drive and then saved in non-volatile memory. *Parameter Cloning* (11.042) is then set to 0 after the data transfer is complete.

It is possible to create a bootable parameter file by setting *Parameter mm.000* (mm.000) = 2001 and initiating a drive reset. This file is created in one operation and is not updated when further parameter changes are made.

When the drive is powered up it detects which option modules are fitted before loading parameters from an NV media card which has been set up for boot mode. If a new option module has been fitted since the last time the drive was powered up, a *Slot1 Different* trip is initiated and then the parameters are transferred from the card. If the parameter file includes the parameters for the newly fitted option module then these are also transferred

to the drive and the *Slot1 Different* trip is reset. If the parameter file does not include the parameters for the newly fitted option module then the drive does not reset the *Slot1 Different* trip. Once the transfer is complete the drive parameters are saved to non-volatile memory. The trip can be reset either by initiating a drive reset or by powering down and then powering up again.

Parameter				11.043 Load Defaults			
Short description				Defines which defaults are to be loaded into the drive			
Mode				Open-Loop			
Minimum		0		Maximum		2	
Default		0		Units			
Type		8 Bit Volatile		Update Rate		Background read	
Display Format		Standard		Decimal Places		0	
Coding				RW, TE, NC			

Value	Text
0	None
1	Standard
2	US

If *Load Defaults* (11.043) is non-zero and a drive reset is initiated then the drive will load and save default parameters. If *Load Defaults* (11.043) = 1 then 50Hz defaults are loaded and if *Load Defaults* (11.043) = 2 then 60Hz defaults are loaded. This parameter has priority over actions defined by *Parameter mm.000* (mm.000) and *Parameter Cloning* (11.042). If *Load Defaults* (11.043) is used to initiate loading defaults the it is cleared along with *Parameter mm.000* (mm.000) and *Parameter Cloning* (11.042) when the action is completed.

Parameter				11.044 User Security Status			
Short description				defines the security level within the drive			
Mode				Open-Loop			
Minimum		0		Maximum		5	
Default				Units			
Type		8 Bit Volatile		Update Rate		Background read	
Display Format		Standard		Decimal Places		0	
Coding				RW, TE, ND, PT			

Value	Text
0	Menu 0
1	All Menus
2	Read-only Menu 0
3	Read-only
4	Status Only
5	No Access

Security

The drive provides a number of different levels of security that can be set by the user via *User Security Status* (11.044); these are shown in the table below.

Security Level	Description	User Security Status (11.044)
Menu 0	All writable parameters are available to be edited but only parameters in Menu 0 are visible.	0
All menus	All writable parameters are visible and available to be edited.	1
Read-only Menu 0	All parameters are read-only. Access is limited to Menu 0 parameters only.	2
Read-only	All parameters are read-only however all menus and parameters are visible.	3
Status only	The keypad remains in status mode and no parameters can be viewed or edited	4
No access	The keypad remains in status mode and no parameters can be viewed or edited. Drive parameters cannot be accessed via a comms/fieldbus interface in the drive or any option module.	5

When security has been set up the drive can either be in the locked or unlocked state. In the locked state the security level that has been set up applies. In the unlocked state the security is not active, but when the drive is powered down and powered up again the drive will be in the locked state. The drive may be relocked without powering down by selecting the required security level with the *User Security Status* (11.044) and initiating a drive reset.

Security can be set up as follows:

1. The *User Security Code* (11.030) should be set to the desired security unlock code (not zero). For security to remain set after power down then a parameter save should be performed to retain the set value.
2. If no further action is taken when the drive is powered down and then powered up read-only security will be set up and locked.
3. If at any time the *User Security Status* (11.044) is set to a value corresponding the one of the security levels shown in the table above and a drive reset is performed the security level is changed to that level. The desired security level is automatically saved and retained after power down, the keypad state changes to status mode and security is locked. (The security level that is active, provided *User Security Code* (11.030) has been saved as a non-zero value, if shown in *Security Status* (11.085).)

When security is set up and locked:

1. Parameter access is restricted as shown in the table above.

2. *User Security Code* (11.030) reads as zero except in parameter edit mode. Therefore it is not possible to read the value of the security code when any level of security is active and locked.

Security can be unlocked as follows:

1. If read-only security is set and locked then any attempt to edit any read/write parameter causes "Security code" to be displayed on the first row of the display. When the Up or Down keys are pressed the second row shows the code being adjusted. On setting the code the user presses the Enter key. If the correct code has been entered then the drive switches to Parameter edit mode on the parameter the user selected to edit, but if the correct code has not been entered the notification "Incorrect security code" is displayed for 2s and the drive returns to Parameter view mode.
2. If Status only or No access security is set and locked then any attempt to leave status mode causes the security code to be requested as per the process described above. If the security code entered must be correct for the keypad state machine to switch to the Parameter view mode. It is then possible to access all parameters normally.

Security can be cleared as follows:

1. Security must be unlocked.
2. The *User Security Code* (11.030) should be set to zero. For security to remain cleared after power down then a parameter save should be performed.

At any time *Security Status* (11.085) can be changed between 0 and 1 to restrict access to Menu 0 alone or to all menus. If the change is made by a keypad the new value becomes active on leaving parameter edit mode.

It should be that *Security Status* (11.085) is a volatile parameter and that the actual state of the security system is stored in *Security Status* (11.085) and *Menu Access Status* (11.086), which are both power-down save parameters. Therefore the security status will be stored when the drive goes into the under-voltage state. If the drive is already in the under-voltage state the security state should be saved by writing 1001 to *Parameter mm.000* (mm.000) and initiating a reset.

Parameter	11.045 Select Motor 2 Parameters		
Short description	Set to 1 to select motor 2 parameters		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Motor 1
1	Motor 2

Select Motor 2 Parameters (11.045) is used to select the motor map 2 parameters from Menu 21 to be substituted for the standard motor parameters. If *Select Motor 2 Parameters* (11.045) is modified when *Drive Active* (10.002) = 1 the change only becomes effective when *Drive Active* (10.002) = 0. When *Select Motor 2 Parameters* (11.045) = 1 the results from auto-tuning are written to the motor map 2 parameters in Menu 21 instead of to the standard parameters. Each time *Select Motor 2 Parameters* (11.045) is changed *Motor Protection Accumulator* (04.019) is reset to zero. *Select Motor 2 Parameters* (11.045) operates in the same way in Regen mode, but *Inductor Protection Accumulator* (04.019) is reset to zero each time the value is changed. *Motor 2 Active* (21.015) shows the motor map that is active.

Parameter	11.046 Defaults Previously Loaded		
Short description	Displays the defaults previously loaded in the drive		
Mode	Open-Loop		
Minimum	0	Maximum	2000
Default		Units	
Type	16 Bit User Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Defaults Previously Loaded (11.046) shows the value used to load the previously loaded defaults (i.e. 1233 for 50Hz defaults, or 1244 for 60Hz defaults).

Parameter	11.047 Onboard User Program: Enable		
Short description	Enables the onboard user program		
Mode	Open-Loop		
Minimum	-1	Maximum	1
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
-1	Reset And Run
0	Stop
1	Run

Onboard user programming provided a background task that loops continuously and a timed task that is executed each time at a defined rate. *Onboard User Program: Enable* (11.047) allows the onboard user program to be controlled as follows:

-1: Reset And Run

The onboard user program will run. If *Onboard User Program: Enable* (11.047) is changed from 0 (Stop) to -1 (Reset And Run) all variables will be reset to their initial values and the user program will run from the start.

0: Stop

The onboard user program is stopped.

1: Run

The onboard user program will run. If *Onboard User Program: Enable* (11.047) is changed from 0 (Stop) to 1 (Run) all variables will be unchanged and the user program will run from the start.

The effect of the above is as follows:

- If the drive powers up with *Onboard User Program: Enable* (11.047) set to either 1 or -1 then all variables will be reset to their initial values before the user program starts.
- If the drive powers up with *Onboard User Program: Enable* (11.047) set to 0, and then *Onboard User Program: Enable* (11.047) is changed to either 1 or -1 then all variables will be reset to their initial values before the user program starts.
- If *Onboard User Program: Enable* (11.047) is set to 0 and then to -1 then all variables will be reset to their initial values before the user program starts.
- If *Onboard User Program: Enable* (11.047) is set to 0 and then to 1 then all variables will be left at their previous values before the user program starts.

Parameter	11.048 Onboard User Program: Status		
Short description	Displays the status of the onboard user program		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Onboard User Program: Status (11.048) shows the status of the onboard user program.

Value	Description
0	A user program is present but is stopped
1	The user program is running
2	The user program has an exception
3	No user program is present

Parameter	11.049 Onboard User Program: Programming Events		
Short description	Displays the number of programming events of the onboard user program		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Onboard User Program: Programming Events (11.049) = 0 when the drive is manufactured and is incremented each time an onboard user program image is written to the drive. If an onboard user program image is written more than 65535 times *Onboard User Program: Programming Events* (11.049) = 65535. *Onboard User Program: Programming Events* (11.049) shows how many times the flash memory within the drive has been reprogrammed.

Parameter	11.050 Onboard User Program: FreewheelingTasks Per Second		
Short description	Displays the rate of freewheeling tasks of the onboard user program		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	One Second Background Write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

During each scan in a freewheeling task it is possible to give an indication to the drive that the scan loop is starting. If this indication is given then *Onboard User Program: FreewheelingTasks Per Second* (11.050) will give the number of times this indication is given per second. It should be noted that this parameter is updated once per second. Because the background time slot for the user program background task occurs every 64ms (15.625 times per second) either 15 or 16 time slots could have been allocated over the monitoring period. Therefore the value given by this parameter can step between two values, one corresponding to the number of updates for 15 slots, and the one corresponding to the number of updates for 16 slots.

Parameter	11.051 Onboard User Program: Clock Task Time Used		
Short description	Displays the percentage of the available time used by the onboard user program clock task		
Mode	Open-Loop		
Minimum	0.0	Maximum	100.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

Onboard User Program: Clock Task Time Used (11.051) shows the percentage of the available time used by the onboard user program clock task.

Parameter	11.052 Serial Number LS		
Short description	Shows the least significant 9 decimal digits of the drive serial number		
Mode	Open-Loop		
Minimum	0 (Display: 000000000)	Maximum	999999999 (Display: 999999999)
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Lead Zero Pad	Decimal Places	0
Coding	RO, ND, NC, PT		

The drive serial number is available as a pair of 32 bit values where *Serial Number LS* (11.052) provides the least significant 9 decimal digits and *Serial Number MS* (11.053) provides the most significant 9 decimal digits. The reconstructed serial number is $((11.053 * 100000000) + 11.052)$.

Example 1

Serial number "1234567898765" would be stored as 11.053 = 1234, 11.052 = 567898765.

Example 2

Serial number "1234000056789" would be stored as 11.053 = 1234, 11.052 = 56789. *Serial Number LS* (11.052) will be shown on the keypad as 000056789 (i.e. including the leading zeros).

Parameter	11.053 Serial Number MS		
Short description	Shows the most significant 9 decimal digits of the drive serial number		
Mode	Open-Loop		
Minimum	0	Maximum	999999999
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Serial Number LS* (11.052).

Parameter	11.054 Drive Date Code		
Short description	Shows the drive date code		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Drive Date Code (11.054) is a four-digit number in the form yyww where yy is the year and ww the week number.

Parameter	11.055 Onboard User Program: Clock Task Scheduled Interval		
Short description	Displays the interval at which the clock task is scheduled in ms		
Mode	Open-Loop		
Minimum	0	Maximum	262140
Default		Units	ms
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Onboard User Program: Clock Task Scheduled Interval (11.055) shows the interval at which the clock task is scheduled to run at in ms.

Parameter	11.060 Maximum Rated Current		
Short description	Displays the maximum rated current or normal duty rating of the drive		
Mode	Open-Loop		
Minimum	0.000	Maximum	99999.999
Default		Units	A
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	3
Coding	RO, ND, NC, PT		

Maximum Rated Current (11.060) defines the variable maximum VM_RATED_CURRENT[MAX] which defines the maximum *Rated Current* (05.007). Therefore *Maximum Rated Current* (11.060) is the maximum rated current for normal duty operation (if normal duty operation is allowed).

Parameter	11.061 Full Scale Current Kc		
Short description	Displays the full scale current Kc		
Mode	Open-Loop		
Minimum	0.000	Maximum	99999.999
Default		Units	A
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	3
Coding	RO, ND, NC, PT		

Full Scale Current Kc (11.061) shows the full scale current in r.m.s. Amps. If the drive current exceeds this level it will cause an over current trip.

Parameter	11.062 Power Board Software Version Number		
Short description	Power Board Software Version Number		
Mode	Open-Loop		
Minimum	0.00	Maximum	99.99
Default		Units	
Type	16 Bit Volatile	Update Rate	Background Write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Power Board Software Version Number (11.062) gives the version for the power board connected to the control board or the power board in node 1 of a multi-power module drive.

Parameter	11.063 Product Type		
Short description	Displays the core product type		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Product Type (11.063) shows the core product type as given in the table below. The drive could be the basic product or a derivative of the basic product as defined by *Drive Derivative* (11.028).

Product Type (11.063)	Core product range
0	Unidrive M

Parameter	11.064 Product Identifier Characters		
Short description	Displays the product identifier characters		
Mode	Open-Loop		
Minimum	1295463729	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

The drive model and rating can be identified as AAAA B nnnnnnnn CCCC DD EE FFF where each section of the model identifier is taken from a parameter. AAAA, B, CCCC, DDDD, EE and FFF are alpha-numeric characters. nnnnnnnn are decimal digits.

Section of Identifier	Parameter
AAAA	<i>Product Identifier Characters</i> (11.064)
nnnnnnnn	<i>Drive Rating And Configuration</i> (11.065)
CCCC	<i>Additional Identifier Characters 1</i> (11.091)
DDEE	<i>Additional Identifier Characters 2</i> (11.092)
FFFB	<i>Additional Identifier Characters 3</i> (11.093)

Drive Rating And Configuration (11.065) is split into a number of fields as defined in the table below.

Digits	Meaning
7 and 6	Frame size
5	Voltage code (2 = 200V, 4 = 400V, 5 = 575V, 6 = 690V)
4 and 0	Current rating multiplied by 10. If the drive has a heavy and normal duty rating (i.e. <i>Maximum Heavy Duty Rating</i> (11.032) > 0 and <i>Maximum Rated Current</i> (11.060) > <i>Maximum Heavy Duty Rating</i> (11.032)), or the drive only has a heavy duty rating (i.e. <i>Maximum Heavy Duty Rating</i> (11.032) = <i>Maximum Rated Current</i> (11.060)), then the current rating is derived from <i>Maximum Heavy Duty Rating</i> (11.032). Otherwise if the drive only has a normal duty rating (i.e. <i>Maximum Heavy Duty Rating</i> (11.032) = 0) then the current rating is derived from <i>Maximum Rated Current</i> (11.060).

Example

The model number M700-03400078 A001 00 AB100 would be displayed in parameters as follows

Parameter	Value
<i>Product Identifier Characters</i> (11.064)	M700
<i>Drive Rating And Configuration</i> (11.065)	03400078
<i>Additional Identifier Characters 1</i> (11.091)	A001
<i>Additional Identifier Characters 2</i> (11.092)	00AB
<i>Additional Identifier Characters 3</i> (11.093)	100-

Parameter	11.065 Drive Rating And Configuration		
Short description	Displays the drive rating and configuration		
Mode	Open-Loop		
Minimum	0 (Display: 00000000)	Maximum	99999999 (Display: 99999999)
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Lead Zero Pad	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.066 Power Stage Identifier		
Short description	Displays the power stage identifiers within the drive		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Power Stage Identifier (11.066) is used to show power stages that require changes to the drive user parameters (i.e. visibility, range or defaults). It should be noted that this parameter does not identify the rating of the power stage.

Power Stage Identifier (11.066)	Power Stage
0	Standard Unidrive M
1	Unidrive M with no braking IGBT
2	Servo drive

Parameter	11.067 Control Board Identifier		
Short description	Displays the control board identifiers within the drive		
Mode	Open-Loop		
Minimum	0.000	Maximum	65.535
Default		Units	
Type	16 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	3
Coding	RO, ND, NC, PT, BU		

Control Board Identifier (11.067) identifies the control board hardware in the form A.BBB. BBB is the hardware identifier from the control board and A indicates whether this is a standard or high speed product as given in the table below.

A	BBB	Control Board
0	002 or 003	Unidrive M - Standard
1	002 or 003	Unidrive M - High Speed
0	004	Servo

Parameter	11.068 Internal I/O Identifier		
Short description	Displays the internal I/O identifiers within the drive		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Internal I/O Identifier (11.068) identifies the internally fitted I/O option as given in the table below.

Internal I/O Identifier (11.068)	Internal I/O
0	Analog and digital I/O
1	Digital only I/O
2	Analog and digital I/O with additional relay
3	Servo drive I/O

The tables below show which I/O functions are available for each of the internally fitted I/O options.

A/I/O	0	1	2	3
Analogue Input 1	All except Disable		All except Disable	Voltage
Analogue Input 2	All except Disable		All except Disable	
Analogue Input 3	Voltage, Thermistor	Thermistor, Disable	Voltage	
Analogue Output 1	Voltage		All	
Analogue Output 2	Voltage		All	

DI/O	Function	0	1	2	3
1	Input/Output	Input/Output	Output	Input/Output	Output
2	Input/Output	Input/Output	Output	Input/Output	Output
3	Input/Output	Input/Output		Input/Output	
4	Input	Input	Input	Input	Input
5	Input	Input	Input	Input	Input
6	Input	Input		Input	
7	Relay Output	Output	Output	Output	
8	24V Supply Output	Output	Output	Output	Output
9	Safe Torque Off 1	Input	Input	Input	Input
10	Safe Torque Off 2	Input ¹	Input	Input ¹	Input
11	Keypad Run Button	Input	Input	Input	
12	Keypad Auxiliary Button	Input	Input	Input	
13	24V Supply Input	Input	Input	Input	
14	Keypad Stop Button	Input	Input	Input	
15	Relay 2 Output			Output	
16	Reset button				Input

1 Only one hardware input is provided which is shared by STO1 and STO2.

Parameter	11.069 Position Feedback Interface Identifier		
Short description	Displays the position feedback interface identifier within the drive		
Mode	Open-Loop		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Position Feedback Interface Identifier (11.069) identifies the type of interface fitted in the position feedback interface option location as given in the table below.

Position Feedback Interface Identifier (11.069)	Position feedback interface
0	Standard Position Feedback
1	None
2	User Comms Module

Parameter	11.070 Core Parameter Database Version		
Short description	Displays the core parameter database version within the drive		
Mode	Open-Loop		
Minimum	0.00	Maximum	99.99
Default		Units	
Type	16 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Core Parameter Database Version (11.070) gives the version number of the parameter database used to define the core parameter menus in the drive (Menu 1 to 14 and 21 to 23) in 2 digit BCD format. All other menus are customisable and if these menus are changed their default values are automatically loaded. However, if the drive software is changed it may be necessary to load defaults for all menus, although this will only be required rarely. Defaults for all menus are loaded when the most significant digit of *Core Parameter Database Version* (11.070) changes. Therefore if the drive firmware is modified and the most significant digit of the core database version has changed an *EEPROM Fail.001* trip is initiated and default parameters are loaded.

Parameter	11.072 NV Media Card Create Special File		
Short description	Defines if a parameter file is created as a macro file during transfer		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *NV Media Card Create Special File* (11.072) = 1 when a parameter file is transferred to an NV media card the file is created as a macro file. *NV Media Card Create Special File* (11.072) is reset to 0 after the file is created or the transfer fails.

Parameter	11.073 NV Media Card Type		
Short description	Displays the type of the currently fitted NV media card		
Mode	Open-Loop		
Minimum	0	Maximum	2
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text	Description
0	None	No media card has been inserted
1	SMART Card	A SMART Card has been inserted
2	SD Card	A FAT formatted SD card has been inserted

NV Media Card File Type (11.038) shows the type of non-volatile media card inserted in the drive.

Parameter	11.075 NV Media Card Read-only Flag		
Short description	Displays the state of the read-only flag for the currently fitted card		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

NV Media Card Read-only Flag (11.075) shows the state of the read-only flag for the currently fitted card.

Parameter	11.076 NV Media Card Warning Suppression Flag		
Short description	Displays the state of the warning flag for the currently fitted card		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

NV Media Card Warning Suppression Flag (11.076) shows the state of the warning flag for the currently fitted card.

Parameter	11.077 NV Media Card File Required Version		
Short description	Displays the version number for a file when it is created on an NV media card		
Mode	Open-Loop		
Minimum	0	Maximum	9999
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, PT		

The value of NV Media Card File Required Version (11.077) is used as the version number for a file when it is created on an NV media card. NV Media Card File Required Version (11.077) is reset to 0 when the file is created or the transfer fails.

Parameter	11.079 Drive Name Characters 1-4		
Short description	Defines characters 1-4 of a string which can be used to identify the drive		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

Drive Name Characters 1-4 (11.079) to Drive Name Characters 13-16 (11.082) can be used to store a 16 character string which can be used to identify the drive. The string is arranged as shown below.

This uses the standard ASCII character set.

Parameter	11.080 Drive Name Characters 5-8		
Short description	Defines characters 5-8 of a string which can be used to identify the drive		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

See Drive Name Characters 1-4 (11.079).

Parameter	11.081 Drive Name Characters 9-12		
Short description	Defines characters 9-12 of a string which can be used to identify the drive		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

See Drive Name Characters 1-4 (11.079).

Parameter	11.082 Drive Name Characters 13-16		
Short description	Defines characters 13-16 of a string which can be used to identify the drive		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

See Drive Name Characters 1-4 (11.079).

Parameter	11.084 Drive Mode		
Short description	Defines and displays the current drive mode		
Mode	Open-Loop		
Minimum	1	Maximum	4
Default		Units	
Type	8 Bit User Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
1	Open-loop
2	RFC-A
3	RFC-S
4	Regen

Drive Mode (11.084) is used to hold the currently active drive mode.

Parameter	11.085 Security Status		
Short description	Displays the security status within the drive		
Mode	Open-Loop		
Minimum	0	Maximum	3
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Read-only
2	Status-only
3	No Access

Security Status (11.085) shows the security that will apply when security is enabled by setting a non-zero value for *User Security Code* (11.030).

Parameter	11.086 Menu Access Status		
Short description	Displays the amount of access of the menus within the drive		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	Menu 0
1	All Menus

If *Menu Access Status* (11.086) = 0 then only Menu 0 can be accessed with a keypad. If *Menu Access Status* (11.086) = 1 then all menus can be accessed with a keypad.

Parameter	11.090 Keypad Port Serial Address		
Short description	Defines the node address for the keypad port serial comms interface		
Mode	Open-Loop		
Minimum	1	Maximum	16
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Keypad Port Serial Address (11.090) defines the node address for the keypad port serial comms interface. Normally the default value of 1 is used, but this can be changed if required. The keypad attached to the port will sense the address automatically.

Parameter	11.091 Additional Identifier Characters 1		
Short description	Displays the additional identifier characters		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.092 Additional Identifier Characters 2		
Short description	Displays the additional identifier characters		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.093 Additional Identifier Characters 3		
Short description	Displays the additional identifier characters		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Menu 12 Single Line Descriptions – User Functions 2 and Brake Control

Mode: Open-Loop

Parameter		Range	Default	Type					
12.001	Threshold Detector 1 Output	Off (0) or On (1)		RO	Bit	ND	NC	PT

Menu 12 – User Functions 2 and Brake Control

Mode: Open-Loop

Menu 12 provides parameters for the following features:

1. Threshold detectors
2. Variable selectors
3. Mechanical brake controller

Parameter	12.001 Threshold Detector 1 Output		
Short description	Displays the output of threshold detector 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

The threshold detector functions are always active even if the source and destination are not routed to valid parameters. If the source is not a valid parameter then the source value is taken as 0. The update rate for each of the threshold detector functions is always 4ms.

The following description is for threshold detector 1, but threshold detector 2 operates in the same way. The level of the parameter defined by *Threshold Detector 1 Source* (12.003) is converted to a percentage and compared to *Threshold Detector 1 Level* (12.004) with hysteresis to give *Threshold Detector 1 Output* (12.001) as follows:

Source	Threshold Detector 1 Output (12.001)
Source	0
Lower threshold ≤ Source	No change of state
Source ≥ Upper threshold	1

Lower threshold = *Threshold Detector 1 Level* (12.004) - *Threshold Detector 1 Hysteresis* (12.005)
 Upper threshold = *Threshold Detector 1 Level* (12.004) + *Threshold Detector 1 Hysteresis* (12.005)

The output value can then be inverted with *Threshold Detector 1 Output Invert* (12.006) before being routed to the destination defined by *Threshold Detector 1 Destination* (12.007).

Parameter	12.002 Threshold Detector 2 Output		
Short description	Displays the output of threshold detector 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.003 Threshold Detector 1 Source		
Short description	Defines the source parameter for threshold detector 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.004 Threshold Detector 1 Level		
Short description	Defines the reference level for threshold detector 1		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.005 Threshold Detector 1 Hysteresis		
Short description	Defines the hysteresis for threshold detector 1		
Mode	Open-Loop		
Minimum	0.00	Maximum	25.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.006 Threshold Detector 1 Output Invert		
Short description	Set to 1 to invert the output of threshold detector 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.007 Threshold Detector 1 Destination		
Short description	Defines the destination parameter for threshold detector 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.008 Variable Selector 1 Source 1		
Short description	Defines the 1st source parameter for variable selector 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

The variable selector functions are always active even if the source and destination are not routed to valid parameters. If a source is not a valid parameter then the source value is taken as 0. The update rate for each of the variable selector functions is always 4ms.

The following description is for variable selector 1, but variable selector 2 operates in the same way. The source parameters selected with *Variable Selector 1 Source 1* (12.008) and *Variable Selector 1 Source 2* (12.009) are converted to a percentage value, scaled with *Variable Selector 1 Source 1 Scaling* (12.013) and *Variable Selector 1 Source 2 Scaling* (12.014) respectively and then combined with a function defined by *Variable Selector 1 Mode* (12.010) to give *Variable Selector 1 Output* (12.012) as a percentage value. If *Variable Selector 1 Enable* (12.016) = 1 then the function operates normally. If *Variable Selector 1 Enable* (12.016) = 0 then *Variable Selector 1 Output* (12.012) = 0.00% and any states within the function are reset (i.e. the time constant function accumulator is held at zero). If the value of *Variable Selector 1 Mode* (12.010) is changed then all internal function state are also reset.

The table below shows the functions that can be selected with *Variable Selector 1 Mode* (12.010).

Variable Selector 1 Mode (12.010)	Variable Selector 1 Output (12.012)
0: Input 1	Input 1
1: Input 2	Input 2
2: Add	Input 1 + Input 2
3: Subtract	Input 1 - Input 2
4: Multiply	(Input 1 x Input 2) / 100.00%
5: Divide	(Input 1 x 100.00%) / Input 2
6: Time Const	Input 1 / (1 + τs) where τ = <i>Variable Selector 1 Control</i> (12.015) seconds
7: Ramp	Input 1 as an input to a linear ramp function where the time to ramp from 0.00% to 100.00% is defined by <i>Variable Selector 1 Control</i> (12.015) seconds
8: Modulus	Input1
9: Powers	If <i>Variable Selector 1 Control</i> (12.015) = 0.02 then Input ² / 100.00% Else if <i>Variable Selector 1 Control</i> (12.015) = 0.03 then Input ³ / 100.00% Else Input 1
10: Sectional	See description below

Sectional Controller

If *Variable Selector 1 Mode* (12.010) = 10 then the variable selector can be used to provide a sectional control function. (Variable selector 2 operates in the same way.) The sectional control function is intended to apply scaling and a speed offset to a 16 bit position value to generate a new 16 bit position value. The output can be used as an input to the Standard motion controller (Menu 13) and to generate an encoder simulation output (Menu 3).

The position input is selected with *Variable Selector 1 Source 1* (12.008) and can be derived from any parameter. However, it is intended to be used with a position value that has a range from 0 to 65535 (e.g. *P1 Position* (03.029)). The input is scaled so that as *Variable Selector 1 Source 1 Scaling* (12.013) is changed between -4.000 and 4.000 so the proportion of the input position change added to the accumulator varies from 0.000 to 2.000 (i.e. the change of position input value is added without scaling if *Variable Selector 1 Source 1 Scaling* (12.013) = 0.000). The remainder from the scaling division is stored and then added at the next sample to maintain an exact ratio between the position input and the position output, provided the speed from source 2 is zero. The controller only takes the change of position from the input source parameter, and not the absolute value, so that when the controller is first made active the output does not jump to the source position, but only moves with any changes of source position after that point in time.

Although the sectional controller is intended to use a source parameter with a range from 0 to 65535, it is possible to use parameters with a different range provided the maximum is a power of two minus 1, i.e. $2^{31} - 1$. It should be noted that the change of position is scaled based on the maximum of the parameter, and so a signed position value such as *P1 Normalised Position* (03.058) which has a maximum that corresponds to half its range will give twice the change of position when compared to *P1 Position* (03.029). To counteract this effect the scaling applied to the change of position in the sectional controller should be set to 0.5.

The range of *Variable Selector 1 Output* (12.012) is 0.00% and 100.00%. Unlike other functions the value is not simply limited, but rolls under or over respectively. Although the output destination can be any parameter it is intended to be used with a position value that has a range from 0 to 65535.

The speed input defines a speed offset with a resolution of 0.1rpm. Full scale of the source parameter corresponds to 1000.0rpm. Scaling may be applied using *Variable Selector 1 Source 2 Scaling* (12.014) to give a full scale value up to 4000.0rpm. The speed input is added to the accumulator to move the output position forwards or backwards with respect to the position input.

The sample time for the variable selector is 4ms and the input or output position must not change by more than half a revolution over this time. Therefore the input or output speed must not exceed 7500rpm.

The diagram below shows an example of how the sectional controller function could be configured. The section input position is provided from the previous section via the P1 position feedback interface. The destination of the variable selector is the *Standard Motion Local Reference Position* (13.021) in the standard motion controller which is used to provide the speed reference and to control the local motor attached to the drive. The encoder simulation system is used to generate the section output to be fed into the next drive. The source for the encoder simulation is *Standard Motion Local Reference Position* (13.021).

Parameter	12.009 Variable Selector 1 Source 2		
Short description	Defines the 2nd source parameter for variable selector 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.010 Variable Selector 1 Mode		
Short description	Defines the mode for variable selector 1		
Mode	Open-Loop		
Minimum	0	Maximum	10
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Input 1
1	Input 2
2	Add
3	Subtract
4	Multiply
5	Divide
6	Time Const
7	Ramp

9	Powers
10	Sectional

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.011 Variable Selector 1 Destination		
Short description	Defines the destination parameter for variable selector 1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.012 Variable Selector 1 Output		
Short description	Displays the output of variable selector 1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.013 Variable Selector 1 Source 1 Scaling		
Short description	Defines the scaling for the 1st input for variable selector 1		
Mode	Open-Loop		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.014 Variable Selector 1 Source 2 Scaling		
Short description	Defines the scaling for the 2nd input for variable selector 1		
Mode	Open-Loop		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.015 Variable Selector 1 Control		
Short description	Defines the control for variable selector 1		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.016 Variable Selector 1 Enable		
Short description	Enables variable selector 1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Variable Selector 1 Source 1* (12.008) for more details.

Variable Selector 1 Enable (12.016) and *Variable Selector 2 Enable* (12.036) have a default of 1 so that if these parameters are not used the variable selectors will still function.

Parameter	12.023 Threshold Detector 2 Source		
Short description	Defines the source parameter for threshold detector 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.024 Threshold Detector 2 Level		
Short description	Defines the reference level for threshold detector 2		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.025 Threshold Detector 2 Hysteresis		
Short description	Defines the hysteresis for threshold detector 2		
Mode	Open-Loop		
Minimum	0.00	Maximum	25.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.026 Threshold Detector 2 Output Invert		
Short description	Set to 1 to invert the output of threshold detector 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.027 Threshold Detector 2 Destination		
Short description	Defines the destination parameter for threshold detector 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.028 Variable Selector 2 Source 1		
Short description	Defines the 1st source parameter for variable selector 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU

Parameter	12.032 Variable Selector 2 Output		
Short description	Displays the output of variable selector 2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.033 Variable Selector 2 Source 1 Scaling		
Short description	Defines the scaling for the 1st input for variable selector 2		
Mode	Open-Loop		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.034 Variable Selector 2 Source 2 Scaling		
Short description	Defines the scaling for the 2nd input for variable selector 2		
Mode	Open-Loop		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

Parameter	12.035 Variable Selector 2 Control		
Short description	Defines the control for variable selector 2		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.036 Variable Selector 2 Enable		
Short description	Enables variable selector 2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.040 Brake Control: Brake Release		
Short description	Enables the brake release function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

The mechanical brake control function can be used to control an electro-mechanical brake via digital I/O. *Brake Control: Brake Release* (12.040) = 0 when the brake should be applied and 1 when the brake should be released. Normally this should be routed to a digital output to control the mechanical brake. See *Brake Control: Enable* (12.041) for details.

Parameter	12.041 Brake Control: Enable		
Short description	Enables the brake control function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Brake Control: Enable* (12.041) = 0 then the brake controller is disabled. The following parameters which are used by the brake controller to operate the drive are reset to 0 on the transition of *Brake Control: Enable* (12.041) from 1 to 0.

Parameter
<i>Force Reference Direction</i> (01.057)
<i>Ramp Hold</i> (02.003)

Open-loop mode

Current detection

The *Current Magnitude* (04.001) is compared to an upper and lower threshold by a comparator with hysteresis to give torque present and drive output open detection functions respectively. *Brake Control: Lower Current Threshold* (12.043) and *Brake Control: Upper Current Threshold* (12.042) are given as a percentage of *Rated Current* (05.007). *Brake Control: Upper Current Threshold* (12.042) should be set to the current level that indicates that there is magnetising current and sufficient torque producing current in the motor to deliver the required amount of torque when the brake is released. The output of the comparator remains active after this level has been reached unless the current subsequently falls below *Brake Control: Lower Current Threshold* (12.043) which should be set to the required level to detect the condition where the motor has been disconnected from the drive. If $\text{Brake Control: Lower Current Threshold (12.043)} \geq \text{Brake Control: Upper Current Threshold (12.042)}$ then the upper threshold applies with a hysteresis band of 0. If $\text{Brake Control: Lower Current Threshold (12.043)} = \text{Brake Control: Upper Current Threshold (12.042)} = 0$ then the output of the comparator is always one.

Frequency detection

The frequency comparator is used on starting, to detect when the motor frequency has reached a level where the motor can produce the required amount of torque to ensure that the motor rotates in the demanded direction when the brake is released. *Brake Control: Brake Release Frequency* (12.044) should be set to a level slightly above the motor slip frequency that is likely to occur under the highest expected load that is applied to the motor when the brake is released.

The brake apply frequency threshold is used to ensure that the brake is applied before the motor frequency reaches zero and to prevent the motor rotating (in the reverse direction due to an overhauling load for example) during the brake apply time. If the frequency falls below *Brake Control: Brake Apply Frequency* (12.045), but the motor is not required to stop (i.e. reversing direction without stopping) then *Reference On* (01.011) will be one, and so the brake is not applied. This prevents the brake from activating and de-activating as the motor passes through zero speed. If the frequency falls below *Brake Control: Brake Apply Frequency* (12.045) and *Reference On* (01.011) = 0 then the brake will be applied.

Brake controller sequence

The brake controller sequence is shown for forward movement in the diagram below.

The current detection, frequency detection and *Drive Active* (10.002) levels are used to allow the brake to be released. *Brake Control: Brake Delay* (12.046) is the delay allowed after the correct current and frequency levels have been detected before the brake is released. *Brake Control: Post-brake Release Delay* (12.047) is the time allowed for the brake to be released before the frequency is allowed to increase above the *Brake Control: Brake Release Frequency* (12.044).

Applying the brake as the frequency passes through zero

In Open-loop mode the torque produced may reduce as the frequency passes through zero. To prevent the load from falling during this period in a vertical application, it is possible to apply the brake momentarily to hold the load. If *Brake Control: Brake Apply Through Zero Threshold* (12.051) = 0 then the brake is not applied when the frequency passes through zero unless *Reference On* (01.011) = 0. If *Brake Control: Brake Apply Through Zero Threshold* (12.051) is non-zero then the brake is always applied when the modulus of frequency is less than *Brake Control: Brake Apply Through Zero Threshold* (12.051) even if *Reference On* (01.011) = 1. This ensures that the brake is applied and then released as the frequency passes through zero. *Brake Control: Brake Apply Through Zero Threshold* (12.051) should be set to a value that is lower than both *Brake Control: Brake Release Frequency* (12.044) and *Brake Control: Brake Apply Frequency* (12.045) so that it does not interfere with the control of the brake when starting and stopping.

Forced initial direction

If *Brake Control: Initial Direction* (12.050) = 0 then the brake controller operates as described above and the user reference is used to define the direction of operation. If *Brake Control: Initial Direction* (12.050) = 1 then *Force Reference Direction* (01.057) is used force the frequency reference to the positive modulus of its value until the end of the post-brake release period whatever the direction of the reference from the user. This can be used for example to ensure that in a vertical application the motor will definitely hold the load at the point when the brake is released. The diagram below shows the brake controller sequence when *Brake Control: Initial Direction* (12.050) = 1, but the user reference direction is reverse. It should be noted that *Brake Control: Initial Direction* (12.050) has no effect if *Brake Control: Brake Apply Through Zero Threshold* (12.051) is non-zero, and that the reference direction is always used as the initial direction, to prevent a condition where the brake would release then apply repeatedly.

If *Brake Control: Initial Direction* (12.050) = 2 then *Force Reference Direction* (01.057) is used to force the frequency reference to minus the modulus of its value until the end of the post-brake release period to ensure that the output frequency is negative during this period.

Parameter	12.042 Brake Control: Upper Current Threshold		
Short description	Defines the upper current threshold for the brake		
Mode	Open-Loop		
Minimum	0	Maximum	200
Default	50	Units	%
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Brake Control: Enable* (12.041).

Parameter	12.043 Brake Control: Lower Current Threshold

Menu 13 – Standard Motion Controller

Mode: Open-Loop

Motion controller format

The diagram below shows the format and interface for the standard motion controller.

Standard motion controller

The standard motion controller outputs are speed feed-forwards and position control loop output both in 0.1rpm units. These are converted to frequency based on the number of motor poles. The position control loop output is always fed into *Speed Feed-forwards* (01.039). The speed feed-forwards derived from the motion controller can also be included in *Speed Feed-forwards* (01.039) if required by setting *Standard Motion Controller Mode* (13.010) to a value of 1 or 3. Alternatively the speed feed-forwards can be derived from the frequency reference. The resulting reference must pass through the drive ramp system (Menu 2) before it defines the motor frequency. Therefore the position feedback loop includes the ramps, and so short ramp times are normally required for stable operation.

Changing *Standard Motion Controller Mode* (13.010) affects other drive parameters as shown in the table below.

Standard Motion Controller Mode (13.010)	Action
0	On changing from any value to 0: <i>Speed Feed-forwards</i> (01.039) = 0 <i>Speed Feed-forwards Select</i> (01.040) = 0
1 or 3	<i>Speed Feed-forwards</i> (01.039) = speed feed-forwards + position control loop output <i>Speed Feed-forwards Select</i> (01.040) = 1
2 or 4	<i>Speed Feed-forwards</i> (01.039) = <i>Reference Selected</i> (01.001) + position control loop output <i>Speed Feed-forwards Select</i> (01.040) = 1
5 or 6	<i>Speed Feed-forwards</i> (01.039) = position control loop output <i>Speed Feed-forwards Select</i> (01.040) = 1

Standard motion controller

The standard motion controller is compatible with the motion controller in Unidrive SP with a sample rate of 4ms. The drive ramp system (Menu 2) operates normally when the standard motion controller is enabled.

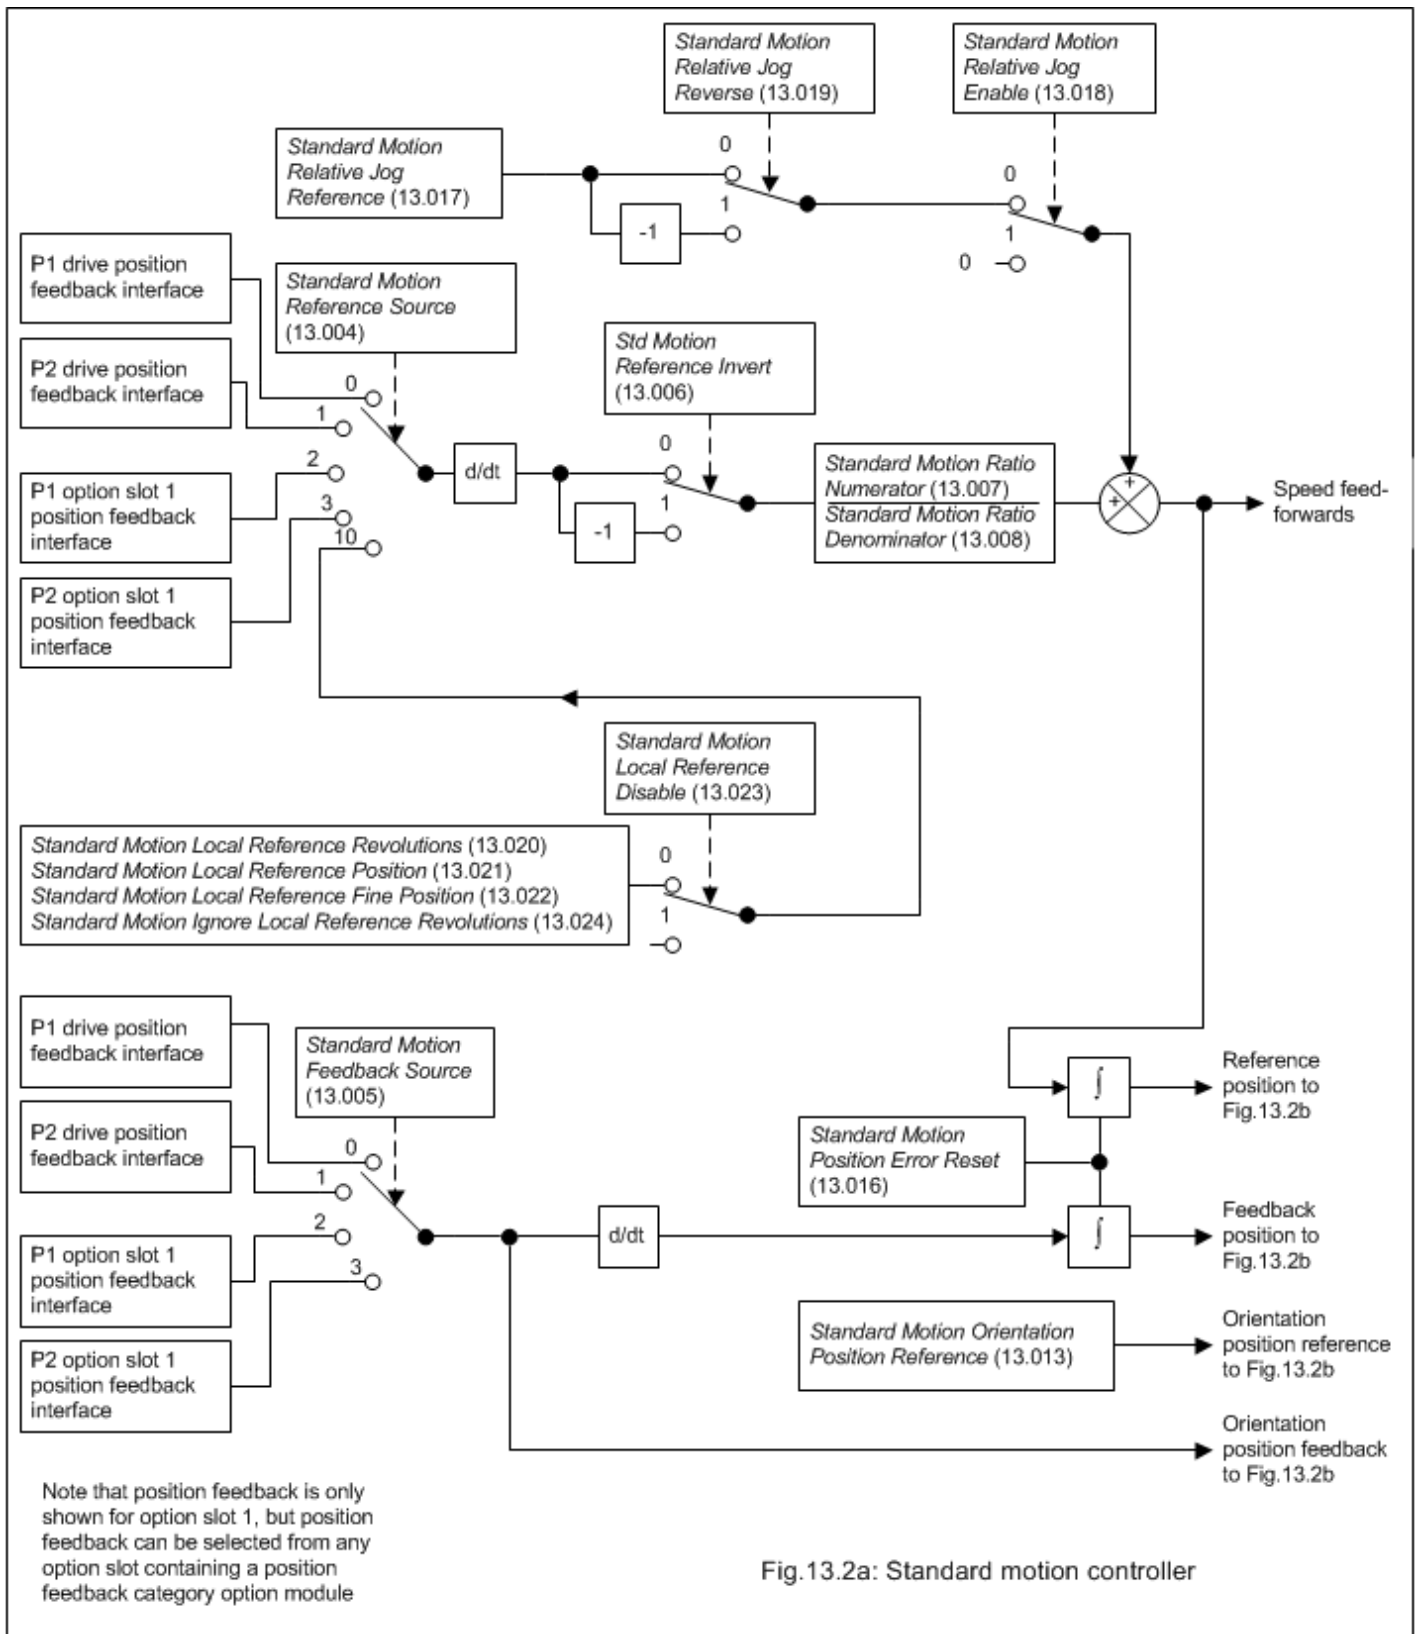

Fig.13.2a: Standard motion controller

Fig.13.2b: Standard motion controller

The Standard Motion Controller uses the full 48 bit position feedback from the position feedback interfaces (Turns, Position and Fine Position), and so it is not affected by the number of turns bits selected to normalise the position for the selected position feedback interface.

Parameter	13.001 Standard Motion Revolutions Error		
Short description	Displays the revolutions error for the Standard Motion Controller		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	Revs
Type	16 Bit Volatile	Update Rate	250 μ s write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Standard Motion Revolutions Error (13.001), Standard Motion Position Error (13.002) and Standard Motion Fine Position Error (13.003) show the difference between the accumulated reference and feedback positions. The integrators are large enough to guarantee that the position controller can operate with a position error from -32768 to 32767 turns before rolling over. For orientation mode the error between the orientation position and the feedback position is shown in Standard Motion Position Error (13.002) only.

Parameter	13.002 Standard Motion Position Error		
Short description	Displays the position error for the Standard Motion Controller		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	250 μ s write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See Standard Motion Revolutions Error (13.001).

Parameter	13.003 Standard Motion Fine Position Error		
Short description	Displays the fine position error for the Standard Motion Controller		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Standard Motion Revolutions Error* (13.001).

Parameter	13.004 Standard Motion Reference Source		
Short description	Defines the input source for the Standard Motion Controller reference		
Mode	Open-Loop		
Minimum	0	Maximum	10
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	P1 Drive
1	P2 Drive
2	P1 Slot1
3	P2 Slot1
4	P1 Slot2
5	P2 Slot2
10	Local

The reference source can be selected from one of the drive position feedback interfaces, a position feedback interface in an option module or from the local reference. If the selected position feedback interface does not exist then it will not be possible to enable the motion controller.

Parameter	13.005 Standard Motion Feedback Source		
Short description	Defines the input source for the Standard Motion Controller feedback		
Mode	Open-Loop		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	P1 Drive
1	P2 Drive
2	P1 Slot1
3	P2 Slot1
4	P1 Slot2
5	P2 Slot2

The feedback source can be selected from one of the drive position feedback interfaces or from a position feedback interface in an option module. If the selected position feedback interface does not exist then it will not be possible to enable the motion controller.

Parameter	13.006 Standard Motion Reference Invert		
Short description	Set to 1 to invert the Standard Motion Controller reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Standard Motion Reference Invert* (13.006) = 1 the reference position direction is reversed.

Parameter	13.007 Standard Motion Ratio Numerator		
Short description	Defines the numerator for the Standard Motion Controller ratio		
Mode	Open-Loop		
Minimum	0.000	Maximum	10.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

A ratio of *Standard Motion Ratio Numerator* (13.007) / *Standard Motion Ratio Denominator* (13.008) can be applied to the change of reference position. The ratio cannot be changed when the drive is enabled without causing abrupt changes of position. Although it is possible to set up ratios with a high gain or even with a denominator of zero, the drive limits the resultant gain of the ratio block to 10.000.

Parameter	13.008 Standard Motion Ratio Denominator		
Short description	Defines the denominator for the Standard Motion Controller ratio		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Standard Motion Ratio Numerator* (13.007).

Parameter	13.009 Standard Motion Proportional Gain Kp		
Short description	Defines the Kp gain used by the Standard Motion Controller		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	25.00	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

The gain of the position control loop is specified in position units/s / position unit. The speed units used in the drive (rpm or mm/s) are dependent on the type of feedback device used and. If rpm are used then the gain units are rev/s / rev (60 x rpm / rev), or if mm/s are used then the gain units are mm/s / mm.

Parameter	13.010 Standard Motion Controller Mode		
Short description	Defines the mode of the Standard Motion Controller		
Mode	Open-Loop		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Rigid Spd FF
2	Rigid
3	Non-rigid Spd FF
4	Non-rigid

0: Disabled

The Standard Motion Controller is disabled if *Standard Motion Controller Mode* (13.010) = 0. The Standard Motion Controller is also disabled if *Reference On* (01.011) = 0 (except for orientation control), or if the reference or feedback sources are not valid. When *Standard Motion Controller Mode* (13.010) is changed the Standard Motion Controller is disabled for one sample after the change.

1: Rigid lock with speed feed-forwards

The diagram below shows the effect of rigid lock. Once the motion controller has been started it will always try to match the position and speed of the reference source. If for example the slave shaft is slowed down due to excessive load, the target position will eventually be recovered by running at a higher speed when the load is removed.

The motion controller generates a speed feed-forward term from the speed of the reference source. This value is passed through Menu 1, and so the ramps (Menu 2) may be included if required. As the motion controller only has a proportional gain, it is necessary to use speed feed-forwards to prevent a constant position error.

Fig.13.3: Non-rigid and rigid locking

2: Rigid lock without speed feed-forwards

Rigid lock without speed feed-forwards operates in the same way as rigid lock with speed feed-forwards except that the speed feed-forwards from the reference source is not provided. If speed feed-forwards is required then this should be supplied via Menu 1.

3: Non-rigid lock with speed feed-forwards

The position control loop is only active when *At Speed* (10.006) = 1. See *At Speed Lower Limit* (03.006) for details. This provides position locking once the feedback speed is close to the reference speed. Speed feed-forwards is generated from the reference source speed.

4: Non-rigid lock without speed feed-forwards

Non-rigid lock without speed feed-forwards operates in the same way as non-rigid lock with speed feed-forwards except that the speed feed-forwards from the reference source is not provided. If speed feed-forwards is required then this should be supplied via Menu 1.

5: Orientation on stop

The motion controller orientates the motor following a stop command. If hold zero speed is enabled (*Hold Zero Speed* (06.008) = 1) the drive remains in position control when orientation is complete and holds the orientation position. If hold zero speed is not enabled the drive is disabled when orientation is complete.

When orientating from a stop command the drive goes through the following sequence:

1. The motor is decelerated or accelerated to the speed defined by the *Standard Motion Speed Clamp* (13.012), using ramps if these are enabled, in the direction the motor was previously running.
2. When the ramp output reaches the set speed, ramps are disabled and the motor continues to rotate until the position is found to be close to the target position (i.e. within 1/32 of a turn). At this point the speed demand is set to 0 and the position loop is closed.
3. When the position is within the *Standard Motion Orientation Acceptance Window* (13.014) the orientation complete indication is given by setting *Standard Motion Orientation Complete* (13.015) to 1.

The stop mode selected by *Stop Mode* (06.001) has no effect if orientation is enabled.

6: Orientation on stop and when the drive is enabled

This mode is the same as orientation on stop, except that orientation is performed whenever the drive is enabled and not just when a stop is required.

Parameter	13.011 <i>Standard Motion Absolute Mode Enable</i>		
Short description	Enables the Absolute mode for the Standard Motion Controller		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Standard Motion Absolute Mode Enable* (13.011) = 0 the reference and feedback integrators are held at 0 while the motion controller is disabled, and

so the controller operates in incremental mode when it is enabled. If *Standard Motion Absolute Mode Enable* (13.011) = 1 the reference and feedback integrators are preset with the position from the reference and feedback sources, and so the controller operates in absolute mode when it is enabled. It should be noted that *Standard Motion Reference Invert* (13.006), *Standard Motion Ratio Numerator* (13.007) and *Standard Motion Ratio Denominator* (13.008) are not applied to the value stored in the reference integrator. Therefore the inversion should not be applied and a ratio of unity should be used in absolute mode.

Parameter	13.012 <i>Standard Motion Speed Clamp</i>		
Short description	Defines the limit applied to the output of the position control loop		
Mode	Open-Loop		
Minimum	0	Maximum	250
Default	150	Units	rpm
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Standard Motion Speed Clamp (13.012) is the limit applied to the output of the position control loop.

Parameter	13.013 <i>Standard Motion Orientation Position Reference</i>		
Short description	Defines the orientation position within a turn with a resolution of 1/65536ths of a turn		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Standard Motion Orientation Position Reference (13.013) defines the orientation position within a turn with a resolution of 1/216 of a turn. *Standard Motion Orientation Acceptance Window* (13.014) defines the acceptance window with a resolution of 1/216 of a turn. The orientation is complete when:

$Standard\ Motion\ Orientation\ Position\ Reference\ (13.013) - Standard\ Motion\ Orientation\ Acceptance\ Window\ (13.014) \leq feedback\ position \leq Standard\ Motion\ Orientation\ Position\ Reference\ (13.013) + Standard\ Motion\ Orientation\ Acceptance\ Window\ (13.014)$

Parameter	13.014 <i>Standard Motion Orientation Acceptance Window</i>		
Short description	Defines the acceptance window with a resolution of 1/65536ths of a turn		
Mode	Open-Loop		
Minimum	0	Maximum	4096
Default	256	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Standard Motion Orientation Position Reference* (13.013).

Parameter	13.015 <i>Standard Motion Orientation Complete</i>		
Short description	Shows when the orientation sequence is complete for the Standard Motion Controller		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Standard Motion Orientation Complete (13.015) is set to 1 when the orientation sequence is complete.

Parameter	13.016 <i>Standard Motion Position Error Reset</i>		
Short description	Resets the reference and feedback integrators		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Standard Motion Position Error Reset* (13.016) = 1 the reference and feedback integrators are held at their reset values (See *Standard Motion Absolute Mode Enable* (13.011)).

Parameter	13.017 Standard Motion Relative Jog Reference		
Short description	Defines the speed that the reference position is moved at		
Mode	Open-Loop		
Minimum	0.0	Maximum	4000.0
Default	0.0	Units	rpm
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

If *Standard Motion Relative Jog Enable* (13.018) = 1 the reference position is moved at the speed defined by *Standard Motion Relative Jog Reference* (13.017) and in the direction defined by *Standard Motion Relative Jog Reverse* (13.019). The relative jog is forwards if *Standard Motion Relative Jog Reverse* (13.019) = 0 and reverse if it is 1.

Parameter	13.018 Standard Motion Relative Jog Enable		
Short description	Enables the use of the relative jog reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Standard Motion Relative Jog Reference* (13.017).

Parameter	13.019 Standard Motion Relative Jog Reverse		
Short description	Sets the direction of the relative jog reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Standard Motion Relative Jog Reference* (13.017).

Parameter	13.020 Standard Motion Local Reference Revolutions		
Short description	Defines the revolutions for the local reference		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	Revs
Type	16 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW, NC, BU		

The local reference (*Standard Motion Local Reference Revolutions* (13.020), *Standard Motion Local Reference Position* (13.021) and *Standard Motion Local Reference Fine Position* (13.022)) can be used as the reference position. If *Standard Motion Local Reference Disable* (13.023) = 1 then the previously written value is used. This allows all three parts of the local reference position to be changed without data skew problems.

Parameter	13.021 Standard Motion Local Reference Position		
Short description	Defines the position for the local reference		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	
Type	16 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW, NC, BU		

See *Standard Motion Local Reference Revolutions* (13.020).

Parameter	13.022 Standard Motion Local Reference Fine Position		
Short description	Defines the fine position for the local reference		
Mode	Open-Loop		
Minimum	0	Maximum	65535
Default	0	Units	
Type	16 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW, NC, BU		

See *Standard Motion Local Reference Revolutions* (13.020).

Parameter	13.023 <i>Standard Motion Local Reference Disable</i>		
Short description	Disables the use of the local reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Standard Motion Local Reference Revolutions* (13.020).

Parameter	13.024 <i>Standard Motion Ignore Local Reference Revolutions</i>		
Short description	Disables the use of the local reference revolutions		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Standard Motion Ignore Local Reference Revolutions* (13.024) = 0 all three parts of the local reference are used. If *Std Standard Motion Ignore Local Reference Revolutions* (13.024) = 1 and *Standard Motion Absolute Mode Enable* (13.011) = 0 only the position and fine position parts of the local reference are used as a 32 bit roll-over counter to define the local reference position.

Parameter	13.026 <i>Standard Motion Sample Rate</i>		
Short description	Standard Motion Sample Rate		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background Write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, NC		

Value	Text
0	Not Active
1	4ms

Standard Motion Sample Rate (13.026) indicates whether the Standard Motion Controller is active or not, and the sample rate being used. The sample rate for the Standard Motion Controller is not selectable and will always be 4ms if the controller is active. It should be noted that both the Advanced and Standard motion controllers cannot be active at the same time. If both are selected at power-up then only the Advanced Motion Controller becomes active. If one controller is active and the other is subsequently enabled without disabling the active controller then the active controller remains active until the drive is powered down and back up again.

Menu 14 Single Line Descriptions – *User PID Controller*

Mode: Open-Loop

Parameter		Range	Default	Type

Menu 14 – User PID Controller

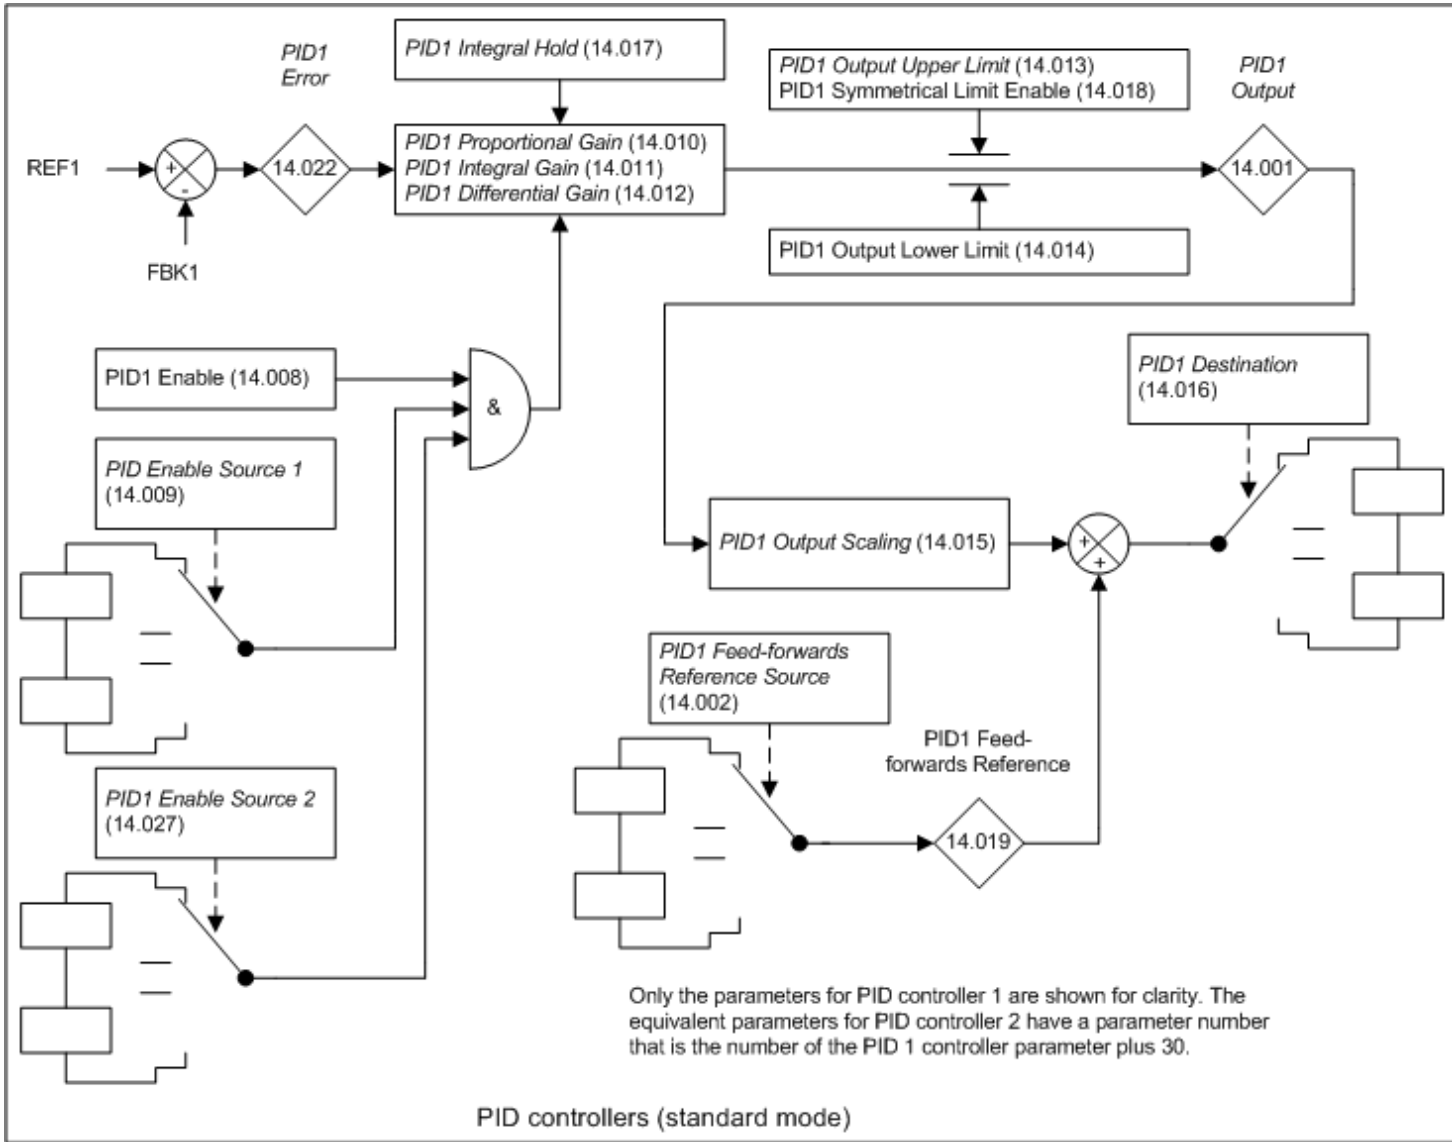

Mode: Open-Loop

PID controllers

Two general purpose PID controllers are provided as shown in the diagram below. Both operate in the same way except that PID controller 2 does not include a pre-sleep boost reference or alternative feedback and error selection. In the following sections a description is given for PID controller 1. The descriptions also apply to PID controller 2 except where stated. The sample rate for the PID controllers is always 4ms.

Parameter	14.001 PID1 Output		
Short description	Displays the output for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Controller

The controller section for the PID controllers is shown in the introduction. The structure of PID controller 1 shown in the introduction is when *PID1 Mode Selector* (14.059) = 0, *PID1 Feedback Output Scaling* (14.058) = 1.000, and *PID1 Feedback Square Root Enable 2* (14.062) = 0. The additional features provided by these parameters are not available for PID controller 2, and so this controller always has the structure shown. If the combined enable is inactive then all internal states are held at zero and the destination parameter will be defined by *PID1 Feed-forwards Reference* (14.019) alone. If the enable is active the PID controller is active even if the destination is not routed to a valid parameter or to 0.000. It should be noted that if either of the enable sources is routed to 0.000 or to a non-valid parameter the source value is taken as 1, therefore with default settings, *PID1 Enable Source 1* (14.009) = 0.000 and *PID1 Enable Source 2* (14.027) = 0.000, the PID controller can be enabled by simply setting *PID1 Enable* (14.008).

PID1 Error (14.022) is the difference between the reference and feedback produced by the reference and feedback systems described in the previous sections. The PID controller output is defined as follows:

$$PID1\ Output\ (14.001) = PID1\ Error\ (14.022) \times [Kp + Ki/s + sKd/(0.064s + 1)]$$

$$Kp = PID1\ Proportional\ Gain\ (14.010)$$

$$Ki = PID1\ Integral\ Gain\ (14.011)$$

$$Kd = PID1\ Differential\ Gain\ (14.012)$$

Therefore:

1. If *PID1 Error* (14.022) = 100.00% the proportional term gives a value of 100.00% if *PID1 Proportional Gain* (14.010) = 1.000.
2. If *PID1 Error* (14.022) = 100.00% the integral term gives a value that increases linearly by 100.00% per second if *PID1 Integral Gain* (14.011) = 1.000.
3. If *PID1 Error* (14.022) increases linearly by 100.00% per second the differential term gives a value of 100.00% if *PID1 Differential Gain* (14.012) = 1.000. (A filter with a time constant of 64ms is provided on the differential gain to reduce the noise produced by this term.)

The output may be limited to a range that is less than the maximum range of *PID1 Output* (14.001) using *PID1 Output Upper Limit* (14.013) and *PID1 Output Lower Limit* (14.014). If *PID1 Output Lower Limit* (14.014) > *PID1 Output Upper Limit* (14.013) then the output is held at the value defined by *PID1 Output Upper Limit* (14.013). If *PID1 Symmetrical Limit Enable* (14.018) = 1 then the lower limit = -(*PID1 Output Upper Limit* (14.013)). If the output reaches either of these limits the integral term accumulator is frozen until the output moves away from the limit to prevent integral wind-up. The integral hold function can also be enabled by the user by setting *PID1 Integral Hold* (14.017) = 1.

PID1 Output Scaling (14.015) can be used to scale the output, which is limited to a range from -100.00% to 100.00% after this function. The output is then added to *PID1 Feed-forwards Reference* (14.019) and is again limited to the range from -100.00% to 100.00% before being routed to the destination defined by *PID1 Destination* (14.016).

Parameter	14.002 PID1 Feed-forwards Reference Source		
Short description	Defines the input source for the feed-forwards reference source for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Output* (14.001).

Parameter	14.003 PID1 Reference Source		
Short description	Defines the input source for the reference for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

The reference section for the PID controllers is shown in the introduction. The pre-sleep boost control is only included in PID controller 1. The reference sections are always active even if the PID controller itself is disabled or the reference sources are not routed to valid parameters. If a reference source is not a valid parameter or is 0.000 then the value is taken as zero.

The reference is the sum of the reference source, the *PID1 Digital Reference* (14.025) and the *PID1 Pre-sleep Boost Level* (14.028) when it is active. The result is multiplied by *PID1 Reference Scaling* (14.023) and then limited to +/-100.00%. The reference can then be inverted if required (*PID1 Reference Invert* (14.005) = 1) and then a slew rate limit is applied with *PID1 Reference Slew Rate* (14.007). This limits the maximum rate of change so that a change from 0.00 to 100.00% takes the time given in *PID1 Reference Slew Rate* (14.007).

Sleep mode is used to stop the motor if the frequency or speed reference falls below a specified level so that the system does not run inefficiently at low speeds (see *Sleep / Wake Threshold* (06.053)). If the frequency or speed reference is controlled by PID controller 1 then the PID controller feedback will fall when sleep mode becomes active because the motor has stopped. The PID controller output will rise again above the sleep/wake threshold and the motor will restart. To minimise the number of transitions into and out of sleep mode the sleep condition can be delayed and an increased reference applied during this period by setting *PID1 Pre-sleep Boost Level* (14.028) to a non-zero value. When *Sleep Required* (06.056) = 1 the *PID1 Pre-sleep Boost Level* (14.028) is added to the reference until *PID1 Error* (14.022) is reduced below zero or until this additional reference has been applied for *PID1 Maximum Boost Time* (14.029). This system is only intended for applications where PID controller 1 alone is used to control the motor frequency or speed via the Menu 1 reference system and the motor rotates in the positive direction under normal conditions. When the PID output first falls below the *Sleep / Wake Threshold* (06.053) it is possible for *PID1 Error* (14.022) to be negative because of a positive value remaining in the integral accumulator. To allow the error to become positive so that the boost period is not terminated immediately, the *PID1 Pre-sleep Boost Level* (14.028) is applied for a minimum of 100ms before the end of the boost period can be terminated because *PID1 Error* (14.022) is greater than or equal to zero.

Parameter	14.004 PID1 Feedback Source		
Short description	Defines the input source for the feedback for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Feedback

The feedback section for the PID controllers is shown in the introduction. The feedback sections are always active even if the PID controller itself is disabled or the feedback sources are not routed to valid parameters. If a reference source is not a valid parameter or is 0.000 then the value is taken as zero.

The feedback is the sum of the feedback source and the *PID1 Digital Feedback* (14.026). The result is multiplied by *PID1 Feedback Scaling* (14.024) and then limited to +/-100.00%. A square root function can be applied (*PID1 Feedback Square Root Enable 1* (14.060) = 1) and the feedback can then be inverted if required (*PID1 Feedback Invert* (14.006) = 1). The square root function is defined as follows.

Square root function output = $\text{Sign}(\text{Input}) \times 100.00\% \times \sqrt{(|\text{Input}| / 100.00\%)}$

where $\text{Sign}(\text{Input}) = 1$ if $\text{Input} \geq 0$ or -1 otherwise

The square root function is useful in applications where the PID controller is operating with air flow as its reference and feedback and the motor is controlling a fan. It is easier to use a pressure transducer than a flow transducer, and so the feedback from the transducer needs to be converted from pressure to flow. As $\text{flow} = \text{Constant} \times \sqrt{\text{Pressure}}$ the square root function can be used in the conversion.

Parameter	14.005 PID1 Reference Invert		
Short description	Set to 1 to invert PID1 reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.006 PID1 Feedback Invert		
Short description	Set to 1 to invert the PID1 feedback		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Feedback Source* (14.004).

Parameter	14.007 PID1 Reference Slew Rate		
Short description	Defines the rate in change of output for PID1		
Mode	Open-Loop		
Minimum	0.0	Maximum	3200.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.008 PID1 Enable		
Short description	Enables the use of PID1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.009 PID1 Enable Source 1		
Short description	Defines the input source for enabling PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Output* (14.001).

Parameter	14.010 PID1 Proportional Gain		
Short description	Defines the Kp gain used for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.011 PID1 Integral Gain		
Short description	Defines the Ki gain used for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	0.500	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.012 PID1 Differential Gain		
Short description	Defines the Kd gain used for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.013 PID1 Output Upper Limit		
Short description	Defines the maximum value of the output for PID1		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.014 PID1 Output Lower Limit		
Short description	Defines the minimum value of the output for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.015 PID1 Output Scaling		
Short description	Defines the scaling factor of the output for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.016 PID1 Destination		
Short description	Defines the output parameter for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *PID1 Output* (14.001).

Parameter	14.017 PID1 Integral Hold		
Short description	Enables the integral hold function for PID1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.018 PID1 Symmetrical Limit Enable		
Short description	Enables the symmetrical limit for PID1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.019 PID1 Feed-forwards Reference		
Short description	Displays the value of the feed-forwards reference for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Output* (14.001).

Parameter	14.020 PID1 Reference		
Short description	Displays the value of the reference for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Reference Source* (14.003).

Parameter	14.021 PID1 Feedback		
Short description	Displays the value of the feedback for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Feedback Source* (14.004).

Parameter	14.022 PID1 Error		
Short description	Displays the value of the error for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Output* (14.001).

Parameter	14.023 PID1 Reference Scaling		
Short description	Defines the scaling factor for the reference for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.024 PID1 Feedback Scaling		
Short description	Defines the scaling factor of the feedback for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Feedback Source* (14.004).

Parameter	14.025 PID1 Digital Reference		
Short description	Defines the value of the digital reference for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.026 PID1 Digital Feedback		
Short description	Defines the value of the digital feedback for PID1		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Feedback Source* (14.004).

Parameter	14.027 PID1 Enable Source 2		
Short description	Defines the input source for enabling PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Output* (14.001).

Parameter	14.028 PID1 Pre-sleep Boost Level		
Short description	Defines the level of the pre-sleep boost function		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.029 PID1 Maximum Boost Time		
Short description	Defines the maximum time that the boost level can be used		
Mode	Open-Loop		
Minimum	0.0	Maximum	250.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

See *PID1 Reference Source* (14.003).

Parameter	14.030 PID1 Pre-sleep Boost Level Enable		
Short description	Enables the pre-sleep boost function		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *PID1 Reference Source* (14.003).

Parameter	14.031 PID2 Output		
Short description	Displays the output for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Output* (14.001).

Parameter	14.032 PID2 Feed-forwards Reference Source		
Short description	Defines the input source for the feed-forwards reference source for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Feed-forwards Reference Source* (14.002).

Parameter	14.033 PID2 Reference Source		
Short description	Defines the input source for the reference for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Reference Source* (14.003).

Parameter	14.034 PID2 Feedback Source		
Short description	Defines the input source for the feedback for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Feedback Source* (14.004).

Parameter	14.035 PID2 Reference Invert		
Short description	Set to 1 to invert PID2 reference		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Reference Invert* (14.005).

Parameter	14.036 PID2 Feedback Invert		
Short description	Set to 1 to invert PID2 feedback		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Feedback Invert* (14.006).

Parameter	14.037 PID2 Reference Slew Rate Limit		
Short description	Defines the rate in change of output for PID2		
Mode	Open-Loop		
Minimum	0.0	Maximum	3200.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *PID1 Reference Slew Rate* (14.007).

Parameter	14.038 PID2 Enable		
Short description	Enables the use of PID2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Enable* (14.008).

Parameter	14.039 PID2 Enable Source 1		
Short description	Defines the input source for enabling PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Enable Source 1* (14.009).

Parameter	14.040 PID2 Proportional Gain		
Short description	Defines the Kp gain used for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Proportional Gain* (14.010).

Parameter	14.041 PID2 Integral Gain		
Short description	Defines the Ki gain used for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	0.500	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Integral Gain* (14.011).

Parameter	14.042 PID2 Differential Gain		
Short description	Defines the Kd gain used for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Differential Gain* (14.012).

Parameter	14.043 PID2 Output Upper Limit		
Short description	Defines the maximum value of the output for PID2		
Mode	Open-Loop		
Minimum	0.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Output Upper Limit* (14.013).

Parameter	14.044 PID2 Output Lower Limit		
Short description	Defines the minimum value of the output for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Output Lower Limit* (14.014).

Parameter	14.045 PID2 Output Scaling		
Short description	Defines the scaling factor of the output for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output Scaling* (14.015).

Parameter	14.046 PID2 Destination		
Short description	Defines the output parameter for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *PID1 Destination* (14.016).

Parameter	14.047 PID2 Integral Hold		
Short description	Enables the integral hold function for PID2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Integral Hold* (14.017).

Parameter	14.048 PID2 Symmetrical Limit Enable		
Short description	Enables the symmetrical limit for PID2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Symmetrical Limit Enable* (14.018).

Parameter	14.049 PID2 Feed-forwards Reference		
Short description	Displays the value of the feed-forwards reference for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Feed-forwards Reference* (14.019).

Parameter	14.050 PID2 Reference		
Short description	Displays the value of the reference for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Reference* (14.020).

Parameter	14.051 PID2 Feedback		
Short description	Displays the value of the feedback for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Feedback* (14.021).

Parameter	14.052 PID2 Error		
Short description	Displays the value of the error for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Error* (14.022).

Parameter	14.053 <i>PID2 Reference Scaling</i>		
Short description	Defines the scaling factor for the reference for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Reference Scaling* (14.023).

Parameter	14.054 <i>PID2 Feedback Scaling</i>		
Short description	Defines the scaling factor of the feedback for PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Feedback Scaling* (14.024).

Parameter	14.055 <i>PID2 Digital Reference</i>		
Short description	Defines the value of the digital reference for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Digital Reference* (14.025).

Parameter	14.056 <i>PID2 Digital Feedback</i>		
Short description	Defines the value of the digital feedback for PID2		
Mode	Open-Loop		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Digital Feedback* (14.026).

Parameter	14.057 <i>PID2 Enable Source 2</i>		
Short description	Defines the input source for enabling PID2		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Enable Source 2* (14.027).

Parameter	14.058 <i>PID1 Feedback Output Scaling</i>		
Short description	Defines the scaling factor of the output feedback for PID1		
Mode	Open-Loop		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

PID1 alternative feedback and error selection

The description given in *PID1 Output* (14.001) assumed that *PID1 Mode Selector* (14.059) = 0 so that PID controller 1 uses its own feedback (FBK1). It is possible to select alternative configurations that allow various combinations of feedback or error from either PID controller to be used as shown

below.

PID1 Mode Selector (14.059) can be used to select the feedback and error as shown in the table below. It should be noted that PID controller 2 will operate normally even when its feedback or error has been selected for PID controller 1. However, if *PID1 Mode Selector* (14.059) is non-zero PID controller 2 enable is controlled directly by the enable state of PID controller 1.

PID1 Mode Selector (14.059)	Feedback	Error
0: Fbk1	FBK1	ERR1
1: Fbk2	FBK2	ERR1
2: Fbk1 + Fbk2	FBK1 + FBK2	ERR1
3: Min Fbk	Lowest of FBK1 or FBK2	ERR1
4: Max Fbk	Highest of FBK1 or FBK2	ERR1
5: Av Fbk	(FBK1 + FBK2) / 2	ERR1
6: Min Error	FBK1	If ERR1 ≤ ERR2 then ERR1 Else ERR2
7: Max Error	FBK1	If ERR1 ≥ ERR2 then ERR1 Else ERR2

PID1 Feedback Output Scaling (14.058) can then be used to scale the results. *PID1 Feedback Square Root Enable 2* (14.062) can be used in converting the output of the combined feedback from pressure to flow. It is easier to use a pressure transducer than a flow transducer, and so the feedback from the transducer needs to be converted from pressure to flow. As $\text{flow} = \text{Constant} \times \sqrt{\text{Pressure}}$ the square root function can be used in the conversion.

Parameter	14.059 PID1 Mode Selector		
Short description	Defines the mode of PID1		
Mode	Open-Loop		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Fbk1
1	Fbk2
2	Fbk1 + Fbk2
3	Min Fbk
4	Max Fbk
5	Av Fbk
6	Min Error
7	Max Error

See *PID1 Feedback Output Scaling* (14.058).

Parameter	14.060 PID1 Feedback Square Root Enable 1		
Short description	Enables the square root function of PID1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Feedback Source* (14.004).

Parameter	14.061 PID2 Feedback Square Root Enable		
Short description	Enables the square root function of PID2		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Feedback Square Root Enable 1* (14.060)

Parameter	14.062 <i>PID1 Feedback Square Root Enable 2</i>		
Short description	Enables the square root function of PID1		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Feedback Output Scaling* (14.058).

Menu 18 – Application Menu 1

Mode: Open-Loop

Menus 18-20 are general application menus that can be used by one of the option modules fitted to the drive. These menus are customisable and the following RAM is provided to be shared between all 3 menus. This is based on increasing the RAM provided for Unidrive SP by approximately 20%.

	1	8	16	32
Volatile	0	32	64	32
User save	64	32	48	12
Power-down save	0	0	2	8

If no option modules provide customisation tables for these menus then the drive provides the customisation tables to give the following parameters.

Parameter	18.001 Application Menu 1 Power-down Save Integer		
Short description	General power-down save integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.002 Application Menu 1 Read-only Integer 2		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.003 Application Menu 1 Read-only Integer 3		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.004 Application Menu 1 Read-only Integer 4		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.005 Application Menu 1 Read-only Integer 5		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.006 Application Menu 1 Read-only Integer 6		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.007 Application Menu 1 Read-only Integer 7		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.008 Application Menu 1 Read-only Integer 8		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.009 Application Menu 1 Read-only Integer 9		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.010 Application Menu 1 Read-only Integer 10		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.011 Application Menu 1 Read-write Integer 11		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.012 Application Menu 1 Read-write Integer 12		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.013 Application Menu 1 Read-write Integer 13		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.014 Application Menu 1 Read-write Integer 14		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.015 Application Menu 1 Read-write Integer 15		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.016 Application Menu 1 Read-write Integer 16		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.017 Application Menu 1 Read-write Integer 17		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.018 Application Menu 1 Read-write Integer 18		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.019 Application Menu 1 Read-write Integer 19		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.020 Application Menu 1 Read-write Integer 20		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.021 Application Menu 1 Read-write Integer 21		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.022 Application Menu 1 Read-write Integer 22		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.023 Application Menu 1 Read-write Integer 23		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.024 Application Menu 1 Read-write Integer 24		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.025 Application Menu 1 Read-write Integer 25		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.026 Application Menu 1 Read-write Integer 26		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.027 Application Menu 1 Read-write Integer 27			
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.028 Application Menu 1 Read-write Integer 28			
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.029 Application Menu 1 Read-write Integer 29			
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.030 Application Menu 1 Read-write Integer 30			
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.031 Application Menu 1 Read-write bit 31			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.032 Application Menu 1 Read-write bit 32			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.033 Application Menu 1 Read-write bit 33			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.034 Application Menu 1 Read-write bit 34			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.035 Application Menu 1 Read-write bit 35			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.036 Application Menu 1 Read-write bit 36			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.037 Application Menu 1 Read-write bit 37			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.038 Application Menu 1 Read-write bit 38			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.039 Application Menu 1 Read-write bit 39			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.040 Application Menu 1 Read-write bit 40			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.041 Application Menu 1 Read-write bit 41			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.042 Application Menu 1 Read-write bit 42			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.043 Application Menu 1 Read-write bit 43			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.044 Application Menu 1 Read-write bit 44			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.045 Application Menu 1 Read-write bit 45			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.046 Application Menu 1 Read-write bit 46			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.047 Application Menu 1 Read-write bit 47			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.048 Application Menu 1 Read-write bit 48			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.049 Application Menu 1 Read-write bit 49			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.050 Application Menu 1 Read-write bit 50			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.051 Application Menu 1 Power-down Save Long Integer 51			
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.052 Application Menu 1 Power-down Save Long Integer 52			
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.053 Application Menu 1 Power-down Save Long Integer 53			
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
18.054 Application Menu 1 Power-down Save Long Integer 54			
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW

Menu 19 – Application Menu 2

Mode: Open-Loop

See the introduction to menu 18.

Parameter	19.001 Application Menu 2 Power-down Save Integer		
Short description	General power-down save integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.002 Application Menu 2 Read-only Integer 2		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.003 Application Menu 2 Read-only Integer 3		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.004 Application Menu 2 Read-only Integer 4		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.005 Application Menu 2 Read-only Integer 5		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.006 Application Menu 2 Read-only Integer 6		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.007 Application Menu 2 Read-only Integer 7		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.008 Application Menu 2 Read-only Integer 8		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.009 Application Menu 2 Read-only Integer 9		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.010 Application Menu 2 Read-only Integer 10		
Short description	General read-only integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	19.011 Application Menu 2 Read-write Integer 11		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.012 Application Menu 2 Read-write Integer 12		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.013 Application Menu 2 Read-write Integer 13		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.014 Application Menu 2 Read-write Integer 14		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.015 Application Menu 2 Read-write Integer 15		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.016 Application Menu 2 Read-write Integer 16		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.017 Application Menu 2 Read-write Integer 17		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.018 Application Menu 2 Read-write Integer 18		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.019 Application Menu 2 Read-write Integer 19		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.020 Application Menu 2 Read-write Integer 20		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.021 Application Menu 2 Read-write Integer 21		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.022 Application Menu 2 Read-write Integer 22		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.023 Application Menu 2 Read-write Integer 23		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.024 Application Menu 2 Read-write Integer 24		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.025 Application Menu 2 Read-write Integer 25		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.026 Application Menu 2 Read-write Integer 26		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.027 Application Menu 2 Read-write Integer 27		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.028 Application Menu 2 Read-write Integer 28		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.029 Application Menu 2 Read-write Integer 29		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.030 Application Menu 2 Read-write Integer 30		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.031 Application Menu 2 Read-write bit 31		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.032 Application Menu 2 Read-write bit 32		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.033 Application Menu 2 Read-write bit 33		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.034 Application Menu 2 Read-write bit 34		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
19.035 Application Menu 2 Read-write bit 35			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
19.036 Application Menu 2 Read-write bit 36			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
19.037 Application Menu 2 Read-write bit 37			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
19.038 Application Menu 2 Read-write bit 38			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
19.039 Application Menu 2 Read-write bit 39			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
19.040 Application Menu 2 Read-write bit 40			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter			
19.041 Application Menu 2 Read-write bit 41			
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.042 Application Menu 2 Read-write bit 42		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.043 Application Menu 2 Read-write bit 43		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.044 Application Menu 2 Read-write bit 44		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.045 Application Menu 2 Read-write bit 45		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.046 Application Menu 2 Read-write bit 46		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.047 Application Menu 2 Read-write bit 47		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.048 Application Menu 2 Read-write bit 48		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.049 Application Menu 2 Read-write bit 49		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.050 Application Menu 2 Read-write bit 50		
Short description	General read-write bit application parameter		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.051 Application Menu 2 Power-down Save Long Integer 51		
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.052 Application Menu 2 Power-down Save Long Integer 52		
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.053 Application Menu 2 Power-down Save Long Integer 53		
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	19.054 Application Menu 2 Power-down Save Long Integer 54		
Short description	General power-down save long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Menu 20 Single Line Descriptions – Application Menu 3

Menu 20 – Application Menu 3

Mode: Open-Loop

See the introduction to menu 18.

Parameter	20.001 Application Menu 3 Read-write Integer 1		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.002 Application Menu 3 Read-write Integer 2		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.003 Application Menu 3 Read-write Integer 3		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.004 Application Menu 3 Read-write Integer 4		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.005 Application Menu 3 Read-write Integer 5		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.006 Application Menu 3 Read-write Integer 6		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.007 Application Menu 3 Read-write Integer 7		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.008 Application Menu 3 Read-write Integer 8		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.009 Application Menu 3 Read-write Integer 9		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.010 Application Menu 3 Read-write Integer 10		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.011 Application Menu 3 Read-write Integer 11		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.012 Application Menu 3 Read-write Integer 12		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.013 Application Menu 3 Read-write Integer 13		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.014 Application Menu 3 Read-write Integer 14		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.015 Application Menu 3 Read-write Integer 15		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.016 Application Menu 3 Read-write Integer 16		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.017 Application Menu 3 Read-write Integer 17		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.018 Application Menu 3 Read-write Integer 18		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.019 Application Menu 3 Read-write Integer 19		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.020 Application Menu 3 Read-write Integer 20		
Short description	General read-write integer application parameter		
Mode	Open-Loop		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.021 Application Menu 3 Read-write Long Integer 21		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.022 Application Menu 3 Read-write Long Integer 22		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.023 Application Menu 3 Read-write Long Integer 23		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.024 Application Menu 3 Read-write Long Integer 24		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.025 Application Menu 3 Read-write Long Integer 25		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.026 Application Menu 3 Read-write Long Integer 26		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.027 Application Menu 3 Read-write Long Integer 27		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.028 Application Menu 3 Read-write Long Integer 28		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.029 Application Menu 3 Read-write Long Integer 29		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	20.030 Application Menu 3 Read-write Long Integer 30		
Short description	General read-write long integer application parameter		
Mode	Open-Loop		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW

Menu 21 – Motor 2 Parameters

Mode: Open-Loop

Contains parameter relative to the set up for motor map 2.

Parameter	21.001 M2 Maximum Reference Clamp		
Short description	Defines the maximum reference clamp for motor map 2		
Mode	Open-Loop		
Minimum	-VM_POSITIVE_REF_CLAMP2	Maximum	VM_POSITIVE_REF_CLAMP2
Default	See exceptions below	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

Region	Default Value
50Hz	50.0
60Hz	60.0

This is the motor map 2 equivalent parameter for *Maximum Reference Clamp* (01.006).

Parameter	21.002 M2 Minimum Reference Clamp		
Short description	Defines the minimum reference clamp for motor map 2		
Mode	Open-Loop		
Minimum	-VM_NEGATIVE_REF_CLAMP2	Maximum	VM_NEGATIVE_REF_CLAMP2
Default	0.0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

This is the motor map 2 equivalent parameter for *Minimum Reference Clamp* (01.007).

Parameter	21.003 M2 Reference Selector		
Short description	Defines which reference is used for motor map 2		
Mode	Open-Loop		
Minimum	0	Maximum	6
Default	1	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	A1 A2
1	A1 Preset
2	A2 Preset
3	Preset
4	Keypad
5	Precision
6	Keypad Ref

This is the motor map 2 equivalent parameter for *Reference Selector* (01.014).

Parameter	21.004 M2 Acceleration Rate 1		
Short description	Defines the acceleration rate used for motor map 2		
Mode	Open-Loop		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

This is the motor map 2 equivalent parameter for *Acceleration Rate 1* (02.011).

Parameter	21.005 M2 Deceleration Rate 1		
Short description	Defines the deceleration rate used for motor map 2		
Mode	Open-Loop		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	10.0	Units	s
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

This is the motor map 2 equivalent parameter for *Deceleration Rate 1* (02.021).

Parameter	21.006 M2 Rated Frequency		
Short description	Defines the motor rated frequency used for motor map 2		
Mode	Open-Loop		
Minimum	0.0	Maximum	599.0
Default	See exceptions below	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Region	Default Value
50Hz	50.0
60Hz	60.0

This is the motor map 2 equivalent parameter for *Rated Frequency* (05.006).

Parameter	21.007 M2 Rated Current		
Short description	Defines the motor rated used for motor map 2		
Mode	Open-Loop		
Minimum	-VM_RATED_CURRENT	Maximum	VM_RATED_CURRENT
Default	0.000	Units	A
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, VM, RA		

This is the motor map 2 equivalent parameter for *Rated Current* (05.007).

Parameter	21.008 M2 Rated Speed		
Short description	Defines the motor rated speed used for motor map 2		
Mode	Open-Loop		
Minimum	0	Maximum	35940
Default	See exceptions below	Units	rpm
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Region	Default Value
50Hz	1500
60Hz	1800

This is the motor map 2 equivalent parameter for *Rated Speed* (05.008).

Parameter	21.009 M2 Rated Voltage		
Short description	Defines the motor rated voltage used for motor map 2		
Mode	Open-Loop		
Minimum	-VM_AC_VOLTAGE_SET	Maximum	VM_AC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Region	Default Value
200V	All	230
400V	50Hz	400
400V	60Hz	460
575V	All	575
690V	All	690

This is the motor map 2 equivalent parameter for *Rated Voltage* (05.009).

Parameter	21.010 M2 Rated Power Factor		
Short description	Defines the motor rated power factor used for motor map 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	1.000
Default	0.850	Units	
Type	16 Bit User Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	3
Coding	RW, RA		

This is the motor map 2 equivalent parameter for *Rated Power Factor* (05.010).

Parameter	21.011 M2 Number Of Motor Poles		
Short description	Defines the number of motor poles used for motor map 2		
Mode	Open-Loop		
Minimum	0	Maximum	240
Default	0	Units	PolePairs
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

This is the motor map 2 equivalent parameter for *Number Of Motor Poles* (05.011).

Parameter	21.012 M2 Stator Resistance		
Short description	Defines the stator resistance used for motor map 2		
Mode	Open-Loop		
Minimum	0.000000	Maximum	1000.000000
Default	0.000000	Units	Ω
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	6
Coding	RW, RA		

This is the motor map 2 equivalent parameter for *Stator Resistance* (05.017).

Parameter	21.014 M2 Transient Inductance		
Short description	Defines the transient inductance used for motor map 2		
Mode	Open-Loop		
Minimum	0.000	Maximum	500.000
Default	0.000	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, RA		

This is the motor map 2 equivalent parameter for *Transient Inductance* (05.024).

Parameter	21.015 Motor 2 Active		
Short description	Indicates if motor 2 parameters are being used by the drive		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

If *Motor 2 Active* (21.015) = 0 then the standard motor set-up parameters are being used or if *Motor 2 Active* (21.015) = 1 then the motor 2 parameters are being used. The motor set-up parameters do not necessarily change immediately when *Select Motor 2 Parameters* (11.045) is changed (i.e. the drive may be enabled). *Motor 2 Active* (21.015) shows the actual motor parameters being used and only changes when the new parameters start being used by the drive.

Parameter	21.016 M2 Motor Thermal Time Constant 1		
Short description	Defines the thermal time constant of the motor used for motor map 2		
Mode	Open-Loop		
Minimum	1.0	Maximum	3000.0
Default	89.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

This is the motor map 2 equivalent parameter for *Motor Thermal Time Constant 1* (04.015).

Parameter	21.022 M2 Current Controller Kp Gain		
Short description	Defines the Kp value of the current controller used for motor map 2		
Mode	Open-Loop		
Minimum	0	Maximum	30000
Default	20	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

This is the motor map 2 equivalent parameter for *Current Controller Kp Gain* (04.013).

Parameter	21.023 M2 Current Controller Ki Gain		
Short description	Defines the Ki value of the current controller used for motor map 2		
Mode	Open-Loop		
Minimum	0	Maximum	30000
Default	40	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

This is the motor map 2 equivalent parameter for *Current Controller Ki Gain* (04.014).

Parameter	21.024 M2 Stator Inductance		
Short description	Define the stator inductance of the motor used for motor map 2		
Mode	Open-Loop		
Minimum	0.00	Maximum	5000.00
Default	0.00	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, RA		

This is the motor map 2 equivalent parameter for *Stator Inductance* (05.025).

Parameter	21.027 M2 Motoring Current Limit		
Short description	Defines the motoring current limit used for motor map 2		
Mode	Open-Loop		
Minimum	0.0	Maximum	VM_MOTOR2_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA, BU		

This is the motor map 2 equivalent parameter for *Motoring Current Limit* (04.005).

Parameter	21.028 M2 Regenerating Current Limit		
Short description	Defines the regenerating current limit used for motor map 2		
Mode	Open-Loop		
Minimum	0.0	Maximum	VM_MOTOR2_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA, BU		

This is the motor map 2 equivalent parameter for *Regenerating Current Limit* (04.006).

Parameter	21.029 M2 Symmetrical Current Limit		
Short description	Defines the symmetrical current limit used for motor map 2		
Mode	Open-Loop		
Minimum	0.0	Maximum	VM_MOTOR2_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA, BU		

This is the motor map 2 equivalent parameter for *Symmetrical Current Limit* (04.007).

Parameter	21.033 M2 Low Speed Thermal Protection Mode		
Short description	Set to enable low speed thermal protection mode		
Mode	Open-Loop		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

This is the motor map 2 equivalent parameter for *Low Speed Thermal Protection Mode* (04.025).

Parameter	21.039 M2 Motor Thermal Time Constant 2		
Short description	Can be used to define an additional motor thermal time constant for motor map 2		
Mode	Open-Loop		
Minimum	1.0	Maximum	3000.0
Default	89.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

This is the motor map 2 equivalent parameter for *Motor Thermal Time Constant 2* (04.037).

Parameter	21.040 M2 Motor Thermal Time Constant 2 Scaling		
Short description	Defines the ratio of the contribution to the motor protection accumulator value from each of the time constants for motor map 2		
Mode	Open-Loop		
Minimum	0	Maximum	100
Default	0	Units	%
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

This is the motor map 2 equivalent parameter for *Motor Thermal Time Constant 2 Scaling* (04.038).

Parameter	21.044 M2 No-load Core Loss		
Short description	M2 No-load Core Loss		
Mode	Open-Loop		
Minimum	0.000	Maximum	99999.999
Default	0.000	Units	kW
Type	32 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	3
Coding	RW		

This is the motor map 2 equivalent parameter for *No-load Core Loss* (04.045).

Parameter	21.045 M2 Rated Core Loss		
Short description	M2 Rated Core Loss		
Mode	Open-Loop		
Minimum	0.000	Maximum	99999.999
Default	0.000	Units	kW
Type	32 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	3
Coding	RW		

This is the motor map 2 equivalent parameter for *Rated Core Loss* (04.046).

Menu 22 – Menu 0 Set-up

Mode: Open-Loop

The parameters in this menu are used to set up which parameters are shown in Menu 0.

Parameter	22.001 Parameter 00.001 Set-up		
Short description	Defines the parameter to be shown in 00.001		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.007	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Each parameter is used to set up the equivalent parameter in Menu 0, for example *Parameter 00.001 Set-up* (22.001) is used to set up which parameter is shown in *Menu 0 Parameter 1* (00.001), etc. 80 selectable Menu 0 parameters (00.001 to 00.080) and equivalent set-up parameters (22.001 to 22.080) are provided. When a Menu 0 set-up parameter is set to 00.000 or a value that is not a valid parameter outside Menu 0, the equivalent Menu 0 parameter is not visible. If a parameter has an equivalent motor 2 parameter in Menu 21 then when *Motor 2 Active* (21.015) = 0 the original parameter is displayed, but when *Motor 2 Active* (21.015) = 1 the equivalent motor 2 parameter from Menu 21 is displayed.

Parameter	22.002 Parameter 00.002 Set-up		
Short description	Defines the parameter to be shown in 00.002		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.006	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.003 Parameter 00.003 Set-up		
Short description	Defines the parameter to be shown in 00.003		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	2.011	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.004 Parameter 00.004 Set-up		
Short description	Defines the parameter to be shown in 00.004		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	2.021	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.005 Parameter 00.005 Set-up		
Short description	Defines the parameter to be shown in 00.005		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.014	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.006 Parameter 00.006 Set-up		
Short description	Defines the parameter to be shown in 00.006		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	4.007	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.007 Parameter 00.007 Set-up		
Short description	Defines the parameter to be shown in 00.007		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.014	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.008 Parameter 00.008 Set-up		
Short description	Defines the parameter to be shown in 00.008		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.015	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.009 Parameter 00.009 Set-up		
Short description	Defines the parameter to be shown in 00.009		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.013	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.010 Parameter 00.010 Set-up		
Short description	Defines the parameter to be shown in 00.010		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.004	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.011 Parameter 00.011 Set-up		
Short description	Defines the parameter to be shown in 00.011		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.001	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.012 Parameter 00.012 Set-up		
Short description	Defines the parameter to be shown in 00.012		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	4.001	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.013 Parameter 00.013 Set-up		
Short description	Defines the parameter to be shown in 00.013		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	4.002	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.014 Parameter 00.014 Set-up		
Short description	Defines the parameter to be shown in 00.014		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	4.011	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.015 Parameter 00.015 Set-up		
Short description	Defines the parameter to be shown in 00.015		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	2.004	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.016 Parameter 00.016 Set-up		
Short description	Defines the parameter to be shown in 00.016		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.017 Parameter 00.017 Set-up		
Short description	Defines the parameter to be shown in 00.017		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	8.026	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.018 Parameter 00.018 Set-up		
Short description	Defines the parameter to be shown in 00.018		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	3.123	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.019 Parameter 00.019 Set-up		
Short description	Defines the parameter to be shown in 00.019		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.020 Parameter 00.020 Set-up		
Short description	Defines the parameter to be shown in 00.020		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.021 Parameter 00.021 Set-up		
Short description	Defines the parameter to be shown in 00.021		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.022 Parameter 00.022 Set-up		
Short description	Defines the parameter to be shown in 00.022		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.010	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.023 Parameter 00.023 Set-up		
Short description	Defines the parameter to be shown in 00.023		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.005	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.024 Parameter 00.024 Set-up		
Short description	Defines the parameter to be shown in 00.024		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.021	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.025 Parameter 00.025 Set-up		
Short description	Defines the parameter to be shown in 00.025		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.022	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.026 Parameter 00.026 Set-up		
Short description	Defines the parameter to be shown in 00.026		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.023	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.027 Parameter 00.027 Set-up		
Short description	Defines the parameter to be shown in 00.027		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	1.024	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.028 Parameter 00.028 Set-up		
Short description	Defines the parameter to be shown in 00.028		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	6.013	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.029 Parameter 00.029 Set-up		
Short description	Defines the parameter to be shown in 00.029		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.036	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.030 Parameter 00.030 Set-up		
Short description	Defines the parameter to be shown in 00.030		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.042	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.031 Parameter 00.031 Set-up		
Short description	Defines the parameter to be shown in 00.031		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.033	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.032 Parameter 00.032 Set-up		
Short description	Defines the parameter to be shown in 00.032		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.032	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.033 Parameter 00.033 Set-up		
Short description	Defines the parameter to be shown in 00.033		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	6.009	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.034 Parameter 00.034 Set-up		
Short description	Defines the parameter to be shown in 00.034		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.030	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.035 Parameter 00.035 Set-up		
Short description	Defines the parameter to be shown in 00.035		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.024	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.036 Parameter 00.036 Set-up		
Short description	Defines the parameter to be shown in 00.036		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.025	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.037 Parameter 00.037 Set-up		
Short description	Defines the parameter to be shown in 00.037		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.023	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.038 Parameter 00.038 Set-up		
Short description	Defines the parameter to be shown in 00.038		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	4.013	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.039 Parameter 00.039 Set-up		
Short description	Defines the parameter to be shown in 00.039		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	4.014	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.040 Parameter 00.040 Set-up		
Short description	Defines the parameter to be shown in 00.040		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.012	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.041 Parameter 00.041 Set-up		
Short description	Defines the parameter to be shown in 00.041		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.018	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.042 Parameter 00.042 Set-up		
Short description	Defines the parameter to be shown in 00.042		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.011	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.043 Parameter 00.043 Set-up		
Short description	Defines the parameter to be shown in 00.043		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.010	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.044 Parameter 00.044 Set-up		
Short description	Defines the parameter to be shown in 00.044		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.009	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.045 Parameter 00.045 Set-up		
Short description	Defines the parameter to be shown in 00.045		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.008	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.046 Parameter 00.046 Set-up		
Short description	Defines the parameter to be shown in 00.046		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.007	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.047 Parameter 00.047 Set-up		
Short description	Defines the parameter to be shown in 00.047		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	5.006	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.048 Parameter 00.048 Set-up		
Short description	Defines the parameter to be shown in 00.048		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.031	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.049 Parameter 00.049 Set-up		
Short description	Defines the parameter to be shown in 00.049		
Mode	Open-Loop		
Minimum	0.000	Maximum	59.999
Default	11.044	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Parameter 00.001 Set-up* (22.001).

Parameter	22.050 Parameter 00.050 Set-up

See *Parameter 00.001 Set-up* (22.001).

Trips

Mode: Open-Loop

Trip 0 (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is the oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost. The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

Trip categories and priorities

Trips are grouped into the categories given in the table below. A trip can only occur when the drive is not tripped, or if it is already tripped and the new trip has a higher priority than the active trip (i.e. lower priority number). Unless otherwise stated a trip cannot be reset until 1.0s after it has been initiated.

Priority	Category	Trips	Comments
1	Internal faults	<i>HF01</i> – <i>HF20</i>	These are fatal problems that cannot be reset. All drive features are inactive after any of these trips occur. If a basic keypad is fitted it will show the trip, but the keypad will not function. These trips are not stored in the trip log.
1	Stored HF trip	<i>Stored HF</i>	This trip cannot be cleared unless 1299 is entered into <i>Parameter mm.000</i> (mm.000) and a reset is initiated.
2	Non-resettable trips	Trip numbers 218 to 247, <i>Slot1 HF</i> , <i>Slot2 HF</i> , <i>Slot3 HF</i> or <i>Slot4 HF</i>	These trips cannot be reset.
3	Volatile memory failure	<i>EEPROM Fail</i>	This can only be reset if <i>Parameter mm.000</i> (mm.000) is set to 1233 or 1244, or if <i>Load Defaults</i> (11.043) is set to a non-zero value.
4	Internal 24V power supply	<i>PSU 24V</i>	
5	Non-volatile media trips	Trip numbers 174, 175 and 177 to 188	These trips are priority 6 during power-up.
5	Position feedback interface power supply	<i>Encoder 1</i>	This trip can override <i>Encoder 2</i> to <i>Encoder 6</i> trips.
6	Trips with extended reset times	<i>OI ac</i> , <i>OI Brake</i> , and <i>OI dc</i>	These trips cannot be reset until 10s after the trip was initiated.
6	Phase loss and d.c. link power circuit protection	<i>Phase Loss</i> and <i>OHI dc bus</i>	The drive will attempt to stop the motor before tripping if a <i>Phase Loss.000</i> trip occurs unless this feature has been disabled (see <i>Action On Trip Detection</i> (10.037)). The drive will always attempt to stop the motor before tripping if an <i>OHI dc bus</i> occurs.
6	Standard trips	All other trips	

Internal faults

Trips {*HF01*} to {*HF20*} are internal faults that do not have trip numbers. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. The error can only be reset by powering the drive down and up again. The table below gives the reasons for internal faults and their corresponding trip.

Trip	Reason
{HF01}	CPU has detected an address error
{HF02}	CPU DMAC has detected an address error
{HF03}	CPU has detected an Illegal opcode
{HF04}	CPU has detected an Illegal slot instruction
{HF05}	An interrupt has occurred that does not have a defined function (Undefined exception)
{HF06}	An interrupt has occurred which is reserved (Reserved exception)
{HF07}	Watchdog failure
{HF08}	CPU Interrupt crash
{HF09}	Free store overflow
{HF10}	Parameter routing system error
{HF11}	Non-volatile memory comms error
{HF12}	Stack overflow. Sub-trip is shown to indicate which stack: 1 – background tasks 2 – timed tasks 3 – main system interrupts
{HF13}	The control hardware is not compatible with the firmware. The sub-trip number gives the actual ID code of the control board hardware.
{HF14}	CPU register bank error
{HF15}	CPU divide error
{HF16}	RTOS error (the background task has returned)
{HF17}	The clock supplied to the control board logic is out of specification
{HF18}	The internal flash memory has failed when writing option module parameter data. Sub-trip is shown to indicate which failure: 1 - Programming error while writing menu in flash 2 - Erase flash block containing setup menus failed 3 - Erase flash block containing application menus failed
{HF19}	Invalid main application firmware CRC. Reprogramming required.
{HF20}	The ASIC is not compatible with the firmware. The sub-trip number displayed is the ASIC version.
{HF23}	If this trip occurs please consult the drive supplier.
{HF24}	If this trip occurs please consult the drive supplier.
{HF25}	If this trip occurs please consult the drive supplier.

When the drive is subsequently powered up a *Stored HF* trip is initiated where the sub-trip number is the number of the HF trip that last occurred. This trip will occur at every power-up until it is reset. The trip can only be reset by first entering 1299 into *Parameter mm.000* (mm.000). If the drive is powered up and a *Stored HF* trip occurs, *Onboard User Program: Enable* (11.047) is reset to zero to prevent the on-board user program from running. This ensures that the user program can be changed or erased in case it causes an HF trip at every power-up. Once the *Stored HF* is cleared, it is necessary to power cycle the drive or to re-download the user program to allow the program to restart.

Similar trips that can be initiated by the control system or the power system

Trips shown in the table below can be generated either from the drive control system or from the power system. The sub-trip number which is in the form *xyzz* is used to identify the source of the trip. The digits *xx* are 00 for a trip generated by the control system or the number of a power module if generated by the power system. If the drive is not a multi-power module drive then *xx* will always have a value of 1 the trip is related to the power system. The *y* digit is used to identify the location of a trip which is generated by a rectifier module connected to a power module. Where the *y* digit is relevant it will have a value of 1 or more, otherwise it will be 0. The *zz* digits give the reason for the trip and are defined in each trip description.

<i>Over Volts</i>	<i>Oht dc bus</i>
<i>OI ac</i>	<i>Phase Loss</i>
<i>OI Brake</i>	<i>Power Comms</i>
<i>PSU</i>	<i>OI Snubber</i>
<i>Oht Inverter</i>	<i>Cloning</i>
<i>Oht Power</i>	<i>Temp Feedback</i>
<i>Oht Control</i>	<i>Power Data</i>

Braking IGBT

The list below gives conditions that will disable the braking IGBT:

1. *Braking IGBT Upper Threshold* (06.074) = 0, or *Low Voltage Braking IGBT Threshold Select* (06.076) = 1 and *Low Voltage Braking IGBT Threshold* (06.075) = 0.
2. The drive is in the under-voltage state.
3. A priority 1, 2 or 3 trip is active (see *Trip 0* (10.020)).
4. One of the following trips is active or would be active if another trip is not already active: *OI Brake*, *PSU*, *Th Brake Res* or *Oht Inverter*.
5. *Percentage Of Drive Thermal Trip Level* (07.036) = 100%. This is an indication that some part of the drive is too hot and is used to indicate if an internally fitted braking resistor is too hot.
6. *Brake R Too Hot* is active or the system has been set up to disable the braking IGBT based on the braking resistor temperature and the resistor is too hot (i.e. bit 2 of *Action On Trip Detection* (10.037) is set).

Note that the braking IGBT over-current trip cannot be reset until 10s after it is initiated. This period consists of a 9s period after the trip where the braking IGBT cannot be switched on again and the *OI Brake* trip is held active and cannot be reset. This 9s period is followed by the normal 1s delay, that is present for other trips, before the trip can be reset. During this 1s period it is possible for the braking IGBT to switch on again. If the conditions are still present that caused the trip then the trip will be initiated again with a further 9s hold-off period etc.

Trips Summary (numerical order)

Value	Trip
0	None
1	Reserved 001
2	Over Volts
3	OI ac
4	OI Brake

Trips (alphabetical order)

Trip	An Input 1 Loss
Value	28
Short description	

Indicates that a current loss was detected in current mode on Analog Input 1 (Terminal 5, 6). In 4-20mA and 20-4mA modes. loss of input is detected if the current falls below 3mA. See *Analog Input 1 Mode* (07.007) for further details.

Recommended actions:

- Check control wiring is correct.
- Check control wiring is undamaged.
- Check *Analog Input 1 Mode* (07.007).
- Check that the current signal is present and greater than 3mA.

Trip	An Input 2 Loss
Value	29
Short description	

Indicates that a current loss was detected in current mode on Analog Input 2 (Terminal 7). In 4-20mA and 20-4mA modes. loss of input is detected if the current falls below 3mA. See *Analog Input 2 Mode* (07.011) for further details.

Recommended actions:

- Check control wiring is correct.
- Check control wiring is undamaged.
- Check *Analog Input 2 Mode* (07.011).

- Check that the current signal is present and greater than 3mA.

Trip	An Output Calib
Value	219
Short description	

The zero offset calibration of one or both of the analogue outputs has failed. This indicates that the drive hardware has failed, or a voltage has been applied to the output via a low impedance possibly due to a wiring error.

Sub-trip	Reason
1	Output 1 failed
2	Output 2 failed

Recommended actions:

- Check the wiring associated with analog outputs.
- Remove all the wiring that is connected to analog outputs and perform a recalibration by power cycling the drive.
- If trip persists, replace the drive.

Trip	App Menu Changed
Value	217
Short description	

The customisation table for an application menu has been changed. The sub-trip indicates which menu has changed:

Sub-trip	Reason
1	Menu 18
2	Menu 19
3	Menu 20

If more than one menu has changed the lowest menu has priority. Drive user parameters must be saved to prevent this trip on the next power-up.

Recommended actions:

- Reset the trip and perform a parameter save to accept the new settings.

Trip	Autotune 1
Value	11
Short description	

The drive has tripped during an auto-tune. The cause of the trip can be identified from the sub-trip number.

Sub-trip	Reason	Recommended actions
1	The position feedback did not change when position feedback is being used during rotating auto-tune.	Ensure that the motor is free to turn (i.e. mechanical brake is released). Check that the position feedback is selected correctly and operates correctly.
2	The motor did not reach the required speed during mechanical load measurement.	Ensure that the motor is free to turn and that the static load plus inertia is not too large for the drive to accelerate within the test time.
3	The required commutation signal edge could not be found during a rotating auto-tune with a Commutation Only position feedback device.	Check that the position feedback signals are connected correctly.
4	The required movement angle cannot be produced during a minimal movement test.	Reduce the angular movement required.
5	The second part of the minimal movement test during auto-tuning cannot locate the motor flux position accurately.	Reduce the angular movement required.
6	The phasing offset angle is measured twice during a stationary auto-tune and the results are not within 30° of each other.	If a minimal movement test is being used and excessive motor movement is occurring during the test reduce the required angle movement. Otherwise try and increase the required angle movement.
7	The motor is moving when a phasing test on enable is selected and the drive is enabled, but the motor is still moving at a speed above the zero speed threshold.	Ensure that the motor is stationary before the drive is enabled.

Trip	Autotune 2
Value	12
Short description	

The drive has tripped during a rotating auto-tune. The cause of the trip can be identified from the associated sub-trip number.

Sub-trip	Reason
1	The position feedback direction is incorrect when position feedback is being used during a rotating auto-tune.
2	A SINCOS encoder with comms is being used for position feedback and the comms position is rotating in the opposite direction to the sine wave based position.

Recommended actions:

- Check motor cable wiring is correct.
- Check feedback device wiring is correct.
- Swap any two motor phases.

Trip	Autotune 3
Value	13
Short description	

The drive has tripped during a rotating auto-tune or mechanical load measurement. The cause of the trip can be identified from the associated sub-trip number.

Sub-trip	Reason
1	Measured inertia has exceeded the parameter range during a mechanical load measurement.
2	The commutation signals changed in the wrong direction during a rotating auto-tune.
3	The mechanical load test has been unable to identify the motor inertia.

Recommended actions for sub-trip 2:

- Check motor cable wiring is correct.
- Check feedback device U, V and W commutation signal wiring is correct.

Recommended actions for sub-trip 3:

- Increase the test level.
- If the test was carried out at standstill repeat the test with the motor rotating within the recommended speed range.

Trip	Autotune 4
Value	14
Short description	

A position feedback device with commutation signals is being used (i.e AB Servo, FD Servo, FR Servo, SC Servo or Commutation Only encoder) and the U commutation signal did not change during a rotating auto-tune.

Recommended actions:

- Check feedback device U commutation signal wiring is correct (Encoder terminals 7 and 8).

Trip	Autotune 5
Value	15
Short description	

A position feedback device with commutation signals is being used (i.e AB Servo, FD Servo, FR Servo, SC Servo or Commutation Only encoder) and the V commutation signal did not change during a rotating auto-tune.

Recommended actions:

- Check feedback device V commutation signal wiring is correct (Encoder terminals 9 and 10).

Trip	Autotune 6
Value	16
Short description	

A position feedback device with commutation signals is being used (i.e AB Servo, FD Servo, FR Servo, SC Servo or Commutation Only encoder) and the W commutation signal did not change during a rotating auto-tune.

Recommended actions:

- Check feedback device W commutation signal wiring is correct (Encoder terminals 11 and 12).

Trip	Autotune 7
Value	17
Short description	

An *Autotune 7* trip is initiated during a rotating auto-tune, if the number of motor poles or the position feedback resolution have been set up incorrectly where position feedback is being used.

Recommended actions:

- Check the lines per revolution for the feedback device.
- Check the number of poles in *Number Of Motor Poles* (05.011).

Trip	Autotune Stopped
Value	18
Short description	

The drive was prevented from completing an auto-tune, because either the Final drive enable or the Final drive run were removed.

Recommended actions:

- Check the drive enable signal (Terminal 31) was active during the auto-tune.
- Check the run command was active in *Digital Input 05 State* (08.005) during the auto-tune.

Trip	Brake R Too Hot
Value	19
Short description	

This trip indicates that braking resistor overload has timed out. The value in *Braking Resistor Thermal Accumulator* (10.039) is calculated using *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061). This trip is initiated when *Braking Resistor Thermal Accumulator* (10.039) reaches 100%.

Recommended actions:

- Ensure the values entered in *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061) are correct.
- If an external thermal protection device is being used and the braking resistor software overload protection is not required, set *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061) to 0 to disable the trip.

Trip	CAM
Value	99
Short description	

Advanced motion controller cam failure.

Sub-trip	Reason
1	AMC Cam Start Index (35.001) > AMC Cam Size (35.003) or AMC Cam Start Position In Segment (35.002) > Cam Table In for the start index
2	AMC Cam Index (35.007) has change by more than 2 in one sample
3	The rate of change at a segment boundary has exceeded the maximum value
4	The sum of the AMC Cam Position In Segment (35.008) and the change of master position has exceeded the maximum value

Trip	Card Access
Value	185
Short description	

A communications failure has occurred with a NV media card. If this occurs during a data transfer to the card then the file being written may be corrupted. If this occurs when data is being transferred from the card then the data transfer may be incomplete. If a parameter file is transferred to the drive and this trip occurs during the transfer the parameters are not saved to non-volatile memory, and so the original parameters can be restored by powering the drive down and up again.

Recommended actions:

- Check the NV media card is installed / located correctly.
- Replace the NV media card.

Trip	Card Boot
Value	177
Short description	

A write to a Menu 0 parameter has been initiated via the keypad by exiting edit mode and *Parameter Cloning* (11.042) is set up for auto or boot mode, but the necessary boot file has not been created on the NV media card fitted to the drive to take the new parameter value. This occurs when *Parameter Cloning* (11.042) is changed to auto or boot mode, but the drive is not subsequently reset. The action of resetting the trip will create the necessary file and prevent further trips.

If this trip occurs after the drive has attempted to transfer parameters from the NV media card to the drive at boot, then the following sub-trips will give the reason for the trip.

Sub-trip	Reason
1	Failed to open / read / close card file 001 when retrieving drive parameter data
2	Failed to open / write / close drive parameter file
11	Failed to open / read / close card file 001 when retrieving option module slot 1 parameter data
12	Failed to open / write / close option module slot 1 parameter file
21	Failed to open / read / close card file 001 when retrieving option module slot 2 parameter data
22	Failed to open / write / close option module slot 2 parameter file
31	Failed to open / read / close card file 001 when retrieving option module slot 3 parameter data
32	Failed to open / write / close option module slot 3 parameter file
41	Failed to open / read / close card file 001 when retrieving option module slot 4 parameter data
42	Failed to open / write / close option module slot 4 parameter file
3	Failed to open / read / close card file 002 when retrieving onboard user program
4	Failed to open / write / close onboard user program in the drive
5	Drive failed to restart following onboard user program update

Recommended actions:

- Ensure that *Parameter Cloning* (11.042) is correctly set, and then reset the drive to create the necessary file on the NV media card.
- Re-attempt the parameter write to the Menu 0 parameter.
- Ensure any option modules are correctly fitted
- Erase the file on the NV media card and recreate the bootable parameter file

Trip	Card Busy
Value	178
Short description	

An attempt has been made to access a file on a NV media card, but the file is already being accessed by an Option Module, such as one of the Applications modules. No data is transferred.

Recommended actions:

- Wait for the Option Module to finish accessing the NV media card and re-attempt the required function.

Trip	Card Compare
Value	188
Short description	

A compare has been carried out between a file on a NV media card and the drive and these are different and no other NV media card related trips have occurred.

Recommended actions:

- Set Pr *mm.000* to 0 to reset the trip.
- Check to ensure the correct data block on the NV media card has been used for the compare.

Trip	Card Data Exists
Value	179
Short description	

An attempt has been made to store data on a NV media card, but the file already exists. No data is transferred. The file should be erased first to prevent this trip.

Recommended actions:

- Erase the data in data location.
- Write data to an alternative data location.

Trip	Card Drive Mode
Value	187
Short description	

This trip is produced during a compare if the drive mode in the file on the NV media card is different from the current drive mode and the file is a parameter file. This trip is also produced if an attempt is made to transfer a parameter file where the source and target drive modes are different and the drive mode is outside the range allowed for the target drive.

Recommended actions:

- Ensure the destination drive supports the drive operating mode in the parameter file.
- Clear the value in Pr *mm.000* and reset the drive.
- Ensure destination drive operating mode is the same as the source parameter file.

Trip	Card Error
Value	182
Short description	

An attempt has been made to access a NV media card, but an error has been detected in the data structure on the card. Resetting this trip will cause the drive to erase the <MCDF> folder from the NV media card (if it exists) and create the correct folder structure. On an SD card, whilst this trip is still present, missing directories will be created, and if the header file is missing it will be created. The following sub-trip numbers are used with this trip.

Sub-trip	Reason
1	The required folder and file structure is not present.
2	The <000> file is corrupted.
3	Two or more files in the <MCDF> folder have the same file identification number.

Recommended actions:

- Erase all the data blocks and re-attempt the process.
- Ensure the card is located correctly.
- Replace the NV media card.

Trip	Card Full
Value	184
Short description	

An attempt has been made to write to a NV media card, but there is insufficient space available. No data is transferred.

Recommended actions:

- Delete a data block or the entire NV media card to create space.
- Replace the NV media card.

Trip	Card No Data
Value	183
Short description	

An attempt has been made to access a non-existent file on a NV media card. No data is transferred.

Recommended actions:

- Ensure data block number is correct.

Trip	Card Option
Value	180
Short description	

A parameter file has been transferred from a NV media card to the drive, but at least one of the option modules are difference between source and target drives. This trip does not stop the data transfer, but is a warning that the data for the option modules that are different will be set to the default values and not the values from the card. This trip also applies if a compare is performed between a parameter file on a card and the drive and the option modules fitted are different between the source and target.

If this trip occurs after the drive has attempted to transfer parameters from the NV media card to the drive at boot, then the following sub-trips will give the reason for the trip.

Sub-trip	Reason
0	One or more option module in the drive differs to the booted image.
1	Option module missing from slot 1
2	Option module missing from slot 2
3	Option module missing from slot 3
4	Option module missing from slot 4

Recommended actions:

- Ensure the correct option modules are installed.
- Ensure the option modules are in the same option module slot as the parameter set stored.
- Press the red reset button to acknowledge that the parameters for one or more of the option modules installed will be at their default vaules.
- This trip can be suppressed by setting Pr *mm.000* to 9666 and resetting the drive.

Trip	Card Product
Value	175
Short description	

If *Drive Derivative* (11.028) or *Product Type* (11.063) are different between the source and target drives then this trip is initiated either at power-up or when the card is accessed. It will have one of the following sub-trip numbers:

Sub-trip	Reason
1	If <i>Drive Derivative</i> (11.028) is different between the source and target drives, this trip is initiated either at power-up or when the SD Card is accessed. Data is still transferred, since this is a warning trip; the trip can be suppressed by entering code 9666 in parameter <i>xx.000</i> , and resetting the drive (this applies the warning suppression flag to the card).
2	If <i>Product Type</i> (11.063) is different between the source and target drives or if corruption is detected in the parameter file, this trip is initiated either at power-up or when the SD Card is accessed. This trip can be reset but no data are transferred in either direction between the drive and the card.
3	A Unidrive SP parameter value was found that has no equivalent parameter on the destination drive. Data is still transferred, since this is a warning trip; the trip can be suppressed by entering code 9666 in parameter <i>xx.000</i> , and resetting the drive (this applies the warning suppression flag to the card).

Recommended actions:

- Use a different NV media card.
- This trip can be suppressed by setting Pr *mm.000* to 9666 and resetting the drive.

Trip	Card Rating
Value	186
Short description	

A parameter file has been transferred from a NV media card to the drive, but the current and/or voltage rating are different between source and target drive. This trip does not stop the data transfer, but is a warning that the data for rating dependent parameters may not be the same on the target as the source drive. This trip also applies if a compare (using Pr *mm.000* set to 8yyy) is performed between a parameter file on the card on the drive.

Recommended actions:

- Reset the drive to clear the trip.
- This trip can be suppressed by setting Pr *mm.000* to 9666 and resetting the drive.

Trip	Card Read Only
Value	181
Short description	

An attempt has been made to modify data on a read-only NV media card or to modify a read-only file (i.e. erase the card, erase a file or create a file). No data is transferred.

Recommended actions:

- Clear the read only flag by setting Pr *mm.000* to 9777 and reset the drive. This will clear the read only flag for all data blocks in the NV media card.

Trip	Card Slot
Value	174
Short description	

The transfer of an option module application program to or from an application module can fail because the option module does not respond correctly. If this happens this trip is produced with the sub-trip indicating the option module slot number.

Sub-trip number	Reason
1	Error in option slot 1
2	Error in option slot 2
3	Error in option slot 3
4	Error in option slot 4

Recommended actions:

- Ensure the source / destination option module is installed on the correct slot.

Trip	Cloning
Value	102
Short description	

If an attempt is made to use the cloning system to back-up the drive and option modules (parameter *mm.000* values from 40001 to 40999) or restore the drive and option modules (parameter *mm.000* values from 60001 to 60999) and the action fails then a "Cloning" trip is initiated. The sub-trip value indicates the reason for the trip.

Sub-trip	Reason
1	The option module in Slot 1 has indicated that it will either back-up or restore its data to/from an SD card, but has failed to respond correctly and the system has timed out.
2	As 1, but for Option Slot 2.
3	As 1, but for Option Slot 3.
4	As 1, but for Option Slot 4.
5	Back-up folders exist or cannot be created when a back-up is initiated.
6	The required back-up folders do not exist when a restore is initiated.

Trip	Configuration
Value	111
Short description	

The *Number Of Power Modules Detected* (11.071) is different from the number expected. The sub-trip value indicates the number of power modules expected.

Recommended actions:

- Ensure that all the power modules are correctly connected and powered up.
- Ensure that the value in *Number Of Power Modules Detected* (11.071) is set to the number of power modules connected.
- Set *Number Of Power Modules Test* (11.035) to 0 to disable the trip if not required.

This trip is also initiated if the number of external rectifiers connected to each power module is less than the number defined by *Number Of Rectifiers Expected* (11.096). If this is the reason for the trip the sub-trip is 10x where x is the number of external rectifiers that should be connected.

Recommended actions:

- Ensure that all the external rectifiers are connected correctly.
- Ensure that the value in *Number Of Rectifiers Expected* (11.096) is correct.

Trip	Control Word
Value	35
Short description	

This trip is initiated by setting bit 12 on the control word in *Control Word* (06.042) when the control word is enabled (*Control Word Enable* (06.043) = On).

Recommended actions:

- Check the value of *Control Word* (06.042).
- Disable the control word in *Control Word Enable* (06.043).

Trip	Current Offset
Value	225
Short description	

The current feedback offset is too large to be trimmed correctly. The sub-trip relates to the output phase for which the offset error has been detected.

Sub-trip	Phase
1	U
2	V
3	W

Recommended actions:

- Ensure that there is no possibility of current flowing in the output phase of the drive when the drive is not enabled.
- Hardware fault - contact the supplier of the drive.

Trip	Data Changing
Value	97
Short description	

A user action or a file system write is active that is changing the drive parameters and the drive has become active, i.e. *Drive Active* (10.002) = 1. The user actions that change drive parameters are loading defaults, changing drive mode, or transferring data from an NV memory card or a position feedback device to the drive. The file system actions that will cause this trip to be initiated if the drive is enabled during the transfer are writing a parameter or macro file to the drive, or transferring a derivative or user program to the drive. It should be noted that none of these actions can be started if the drive is active, and so the trip only occurs if the action is started and then the drive is enabled.

Recommended actions:

- Ensure the drive is not enabled when one of the following is being carried out:
 - Loading defaults
 - Changing drive mode
 - Transferring data from a NV media card or position feedback device
 - Transferring user programs

Trip	Derivative ID
Value	247
Short description	

There is a problem with the identifier associated with derivative image which customises the drive. The reason for the trip is given by the sub-trip as follows.

Sub-trip	Reason for trip
1	There should be a derivative image in the product but this has been erased.
2	The identifier is out of range.
3	The derivative image has been changed.

Trip	Derivative Image
Value	248
Short description	

An error has been detected in the derivative product image. The sub-trip indicated the reason for the trip.

Sub-trip	Reason	Comments
1	Divide by zero	
2	Undefined trip	
3	Attempted fast parameter access set-up with non-existent parameter	
4	Attempted access to non-existent parameter	
5	Attempted write to read-only parameter	
6	Attempted and over-range write	
7	Attempted read from write-only parameter	
30	The image has failed because either its CRC is incorrect, or there are less than 6 bytes in the image or the image header version is less than 5.	Occurs when the drive powers-up or the image is programmed. The image tasks will not run.
31	The image requires more RAM for heap and stack than can be provided by the drive.	As 30.
32	The image requires an OS function call that is higher than the maximum allowed.	As 30.
40	The timed task has not completed in time and has been suspended.	
41	Undefined function called, i.e. a function in the host system vector table that has not been assigned.	As 40.
51	Core menu customisation table CRC check failed	As 30.
52	Customisable menu table CRC check failed	As 30.
53	Customisable menu table changed	Occurs when the drive powers-up or the image is programmed and the table has changed. Defaults are loaded for the derivative menu and the trip will keep occurring until drive parameters are saved.
61	The option module fitted in slot 1 is not allowed with the derivative image.	As 30.
62	The option module fitted in slot 2 is not allowed with the derivative image.	As 30.
63	The option module fitted in slot 3 is not allowed with the derivative image.	As 30.
64	The option module fitted in slot 4 is not allowed with the derivative image.	As 30.
70	An option module that is required by the derivative image is not fitted in any slot.	As 30.
71	An option module specifically required to be fitted in slot 1 not present.	As 30.
72	An option module specifically required to be fitted in slot 2 not present.	As 30.
73	An option module specifically required to be fitted in slot 3 not present.	As 30.
74	An option module specifically required to be fitted in slot 4 not present.	As 30.
80	*Image is not compatible with the control board	Initiated from within the image code.
81	*Image is not compatible with the control board serial number	As 80.

Recommended actions:

- Contact the supplier of the drive.

Trip	Destination
Value	199
Short description	

This trip indicated that destination output parameters of two or more logic functions (Menus 05, 07, 08, 09, 12 or 14) within the drive are writing to the same parameter.

Recommended actions:

- Set Pr *mm.000* to "Destinations" or 12001 and check all visible parameters in all menus for parameter write conflicts.

Trip	Drive Size
Value	224
Short description	

This trip indicates that the control PCB has not recognized the drive size of the power circuit to which it is connected.

Recommended actions:

- Ensure the drive is programmed to the latest software version.
- Hardware fault - return drive to supplier.

Trip	EEPROM Fail
Value	31
Short description	

EEPROM Fail trip indicates that default parameters have been loaded because of the reasons given below.

Sub-trip	Reason
1	The most significant digit of the internal parameter database version number has changed.
2	The CRC's applied to the parameter data stored in internal non-volatile memory indicate that a valid set of parameters cannot be loaded.
3	The drive mode restored from internal non-volatile memory is outside the allowed range for the product or the derivative image does not allow the previous drive mode.
4	The drive derivative image has been changed and it has changed the customisation of the drive core menus.
5	The power stage hardware has been change and changed the customisation of the drive core menus.
6	The internal I/O hardware has been change and changed the customisation of the drive core menus.
7	The position feedback interface hardware has been change and changed the customisation of the drive core menus.
8	The control board hardware has been change and changed the customisation of the drive core menus.
9	The checksum on the non-parameter area of the EEPROM has failed.

The drive holds two banks of user save parameters and two banks of power down save parameters in non-volatile memory. If the last bank of either set of parameters that was saved is corrupted a *User Save* or *Power Down Save* trip is produced. If one of these trips occurs the parameters values that were last saved successfully are used. It can take some time to save parameters when requested by the user and if the power is removed from the drive during this process it is possible to corrupt the data in the non-volatile memory.

If both banks of user save parameters or both banks of power down save parameters are corrupted or one of the other conditions given in the table above occurs *EEPROM Fail.xxx* trip is produced. If this trip occurs it is not possible to use the data that has been saved previously, and so the drive will be in lowest allowed drive mode with default parameters. The trip can only be reset if *Parameter mm.000* (mm.000) is set to 10, 11, 1233 or 1244 or if *Load Defaults* (11.043) is set to a non-zero value.

Recommended actions:

- Default the drive and perform a drive reset.
- Allow sufficient time to perform a save before the supply to the drive is removed.
- If the trip persists, return drive to the supplier.

Trip	Encoder 1
Value	189
Short description	

Drive position feedback interface power supply overloaded. Terminals 13 & 14 of the 15 way D-type connector can supply a maximum current of 200mA at 15V or 300mA at 5V.

Recommended actions:

- Check encoder power supply wiring.
- Disable the termination resistors (*P1 Termination Select* (03.039) set to 0) to reduce current consumption.
- For 5V encoders with long cables, select 8V (*P1 Supply Voltage* (03.036)) and fit a 5V voltage regulator close to the encoder.
- Check the encoder specification to confirm it is compatible with the encoder port power supply current capability.
- Replace the encoder.
- Use an external power supply with higher current capability.

Trip	Encoder 2
Value	190
Short description	

There is a wire break between the drive and the position feedback device. These trips are provided for the P1 position feedback interface only and the exact cause of the trip can be identified from the sub-trip number as given below.

Sub-trip	Signals
1	Resolver or SIN COS sine wave signals
11	Digital incremental A signal
12	Digital incremental B signal
13	Digital incremental Z signal
14	SC SC device single turn sine wave commutation signals.
15	SC SC device marker

This trip can occur if the position feedback device type selected in *P1 Device Type* (03.038) is not correct for the position feedback device connected to the drive.

Recommended actions:

- Ensure that the position feedback device type selected in *P1 Device Type* (03.038) is correct for the position feedback device connected to the P1 interface on the drive.

- If wire break detection on the drive encoder input is not required, set bit 0 of *P1 Error Detection Level* (03.040) to 0 to disable the Encoder 2 trip.
- If the trip is due to the digital incremental Z (marker signal) this is often not connected. Check that this trip is disabled by setting *P1 Termination Select* (03.039) to a value that disables the termination on this input, which will disable hardware wire break detection.
- Check cable continuity.
- Check wiring of feedback signals is correct.
- Check encoder power supply is set correctly (*P1 Supply Voltage* (03.036)).
- Replace the encoder.

Trip	Encoder 3
Value	191
Short description	

The drive has detected an incorrect UVW phase angle while running (RFC-S mode only) or SINCOS phase error. The feedback device which has caused the trip can be identified by the sub-trip number.

Sub-trip	Reason
1	Drive position feedback interface 1
2	Drive position feedback interface 2

Recommended actions:

- Check encoder shield connections.
- Ensure the encoder cable is one uninterrupted cable.
- Check the encoder signal for noise with an oscilloscope.
- Check the integrity of the encoder mechanical mounting.
- For a UVW servo encoder, ensure that the phase rotation of the UVW commutation signals is the same as the phase rotation of the motor.
- For a SINCOS encoder, ensure that motor and incremental SINCOS connections are correct and that for forward rotation of the motor, the encoder rotates clockwise (when looking at the shaft of the encoder).
- Repeat the offset measurement test.

Trip	Encoder 4
Value	192
Short description	

This trip indicates that the encoder communications has timed out or the communications position message transfer time is too long. This trip can also be caused due to a wire break in the communication channel between the drive and the encoder. The feedback device which has caused the trip can be identified by the sub-trip number.

Sub-trip	Reason
1	Drive position feedback interface 1
2	Drive position feedback interface 2

Recommended actions:

- Ensure the encoder power supply setting (*P1 Supply Voltage* (03.036)) is correct.
- Complete encoder auto-configuration (*P1 Auto-configuration Select* (03.041) = Enabled).
- Check the encoder wiring.
- Replace the feedback device.

Trip	Encoder 5
Value	193
Short description	

This trip indicates that there is a checksum or CRC error, or the SSI encoder is not ready. The Encoder 5 trip can also indicate a wire break to a communications based encoder.

Sub-trip	Reason
1	Drive position feedback interface 1
2	Drive position feedback interface 2

Recommended actions:

- Check the encoder cable shield connections.
- Ensure the cable is one uninterrupted cable - remove any connector blocks or if unavoidable minimise the length of any shield pigtailed to the connector block.
- Check the encoder signal for noise with an oscilloscope.
- Check *P1 Comms Bits* (03.035).
- If using a HiPerface, EnDat or BiSS encoder, carry out an encoder auto-configuration (*P1 Auto-configuration Select* (03.041) = Enabled).
- Replace the encoder.

Trip	Encoder 6
Value	194
Short description	

This trip indicates that the encoder has indicated an error or that the power supply has failed to an SSI encoder. This trip can also indicate a wire break to an SSI encoder.

Sub-trip	Reason
1	Drive position feedback interface 1
2	Drive position feedback interface 2

Recommended actions:

- For SSI encoders, check the wiring and encoder power supply setting (*P1 Supply Voltage* (03.036)).
- For BiSS encoders this trip will often occur if *P1 Comms Bits* (03.035) is not set correctly because a position or CRC bit may be read instead of the /Error bit.
- For SC Hiperface encoders this trip indicates that the encoder is detecting an error.
- Replace the encoder / contact the supplier of the encoder.

Trip	Encoder 7
Value	195
Short description	

A set-up parameter for the position feedback device has been changed. See *P1 Error Detection Level* (03.040).

Sub-trip	Reason
1	Drive position feedback interface 1
2	Drive position feedback interface 2

Trip	Encoder 8
Value	196
Short description	

This trip indicates that the position feedback interface communications time exceeds 250µs. The feedback device which has caused the trip can be identified by the sub-trip number.

Sub-trip	Reason
1	Drive position feedback interface 1
2	Drive position feedback interface 2

Recommended actions:

- Ensure the encoder is connected correctly.
- Ensure that the encoder is compatible.
- Increase baud rate.

Trip	Encoder 9
Value	197
Short description	

- This indicates that the position feedback selected from an option slot that does not contain a position feedback category option module.

Recommended action:

- Check the setting of *Motor Control Feedback Select* (03.026) (or *M2 Motor Control Feedback Select* (21.021) if the second motor parameters have been enabled).
- Ensure that the option slot selected in *Motor Control Feedback Select* (03.026) has a feedback option module installed.

Trip	Encoder 12
Value	162
Short description	

This trip indicates that the drive is communicating with the encoder but the encoder type is not recognised.

Sub-trip	Reason
1	Drive position feedback interface 1
2	Drive position feedback interface 2

Recommended actions:

- Enter the encoder setup parameters manually.
- Check to see if the encoder supports auto-configuration.

Trip	Encoder 13
Value	163
Short description	

This trip indicates that the data read from the encoder was out of range during auto-configuration. No parameters will be modified with data read from the encoder as a result of auto-configuration. The tens in the sub-trip number indicate the interface number (i.e. 1 for P1 interface and 2 for P2 interface).

Sub-trip	Reason
x1	Rotary lines per revolution error
x2	Linear comms pitch error
x3	Linear line pitch error
x4	Rotary turns bits error
x5	Communcations bits error
x6	Calculation time is too long
x7	Line delay measured is longer than 5µs

Recommended actions:

- Enter the encoder setup parameters manually.
- Check to see if the encoder supports auto-configuration.

Trip	Encoder 14
Value	164
Short description	

The data given in the additional configuration parameter for a position feedback interface is out of range. If the sub-trip number is one then the data is out of range in *P1 Additional Configuration* (03.074), or if the sub-trip number is 2 the data is out of range in *P2 Additional Configuration* (03.174). Not all position feedback devices use the additional configuration, but those that do are listed below.

BiSS

Range checking is applied to the turns padding (decimal digits 5-3) and position padding (decimal digits 2-0). If these give a padding value outside +/-16 then the trip is initiated. Note that in each case the most significant digit indicates left (0) or right (1) padding, and the least significant 2 digits indicate the number of bits.

Trip	External Trip
Value	6
Short description	

External trip is initiated as shown in the table below.

Sub-trip	Reason
1	<i>External Trip Mode</i> (08.010) = 1 or 3 and SAFE TORQUE OFF Input 1 is low
2	<i>External Trip Mode</i> (08.010) = 2 or 3 and SAFE TORQUE OFF Input 2 is low
3	<i>External Trip</i> (10.032) = 1

Recommended actions:

- Check the SAFE TORQUE OFF signal voltage on terminal 31 is 24V.
- Check the value of *STO Input 01 State* (08.009) which indicates the digital state of terminal 31.
- If external trip detection of the SAFE TORQUE OFF input is not required, set *External Trip Mode* (08.010) to Off (0).
- Check the value of *External Trip* (10.032).
- Select "Destinations" (or enter 12001) in *Pr mm.000* and check for a parameter controlling *External Trip* (10.032).
- Ensure *External Trip* (10.032) or *User Trip* (10.038) (=6) is not being used by serial comms.

Trip	I/O Overload
Value	26
Short description	

This trip indicates that the total current drawn from the 24V user supply or from the digital output has exceeded the limit. A trip is initiated if one or more of the following conditions:

- Maximum output current from one digital output is 100mA.
- The combined maximum output current from outputs 1 and 2 is 100mA.
- The combined maximum output current from output 3 and +24V output is 100mA.

Recommended actions:

- Check total loads on digital outputs.
- Check control wiring is correct.
- Check output wiring is undamaged.

Trip	Inductance
Value	8
Short description	

This trip occurs in RFC-S mode when the drive has detected that the motor inductances are not suitable for the operation being attempted. The trip is either caused because the ratio or difference between L_d and L_q is too small or because the saturation characteristic of the motor cannot be measured.

If the inductance ratio or difference is too small this is because one of the following conditions is true:

$$(No-load L_q (05.072) - L_d (05.024)) / L_d (05.024) < 0.1$$

$$(No-load L_q (05.072) - L_d (05.024)) < (K / Full Scale Current K_c (11.061))H$$

where:

Drive Rated Voltage (11.033)	K
200V	0.0073
400V	0.0146
575V	0.0174
690V	0.0209

If the saturation characteristic of the motor cannot be measured this is because when the flux in the motor is changed the measured value of L_d does not change sufficiently due to saturation to be measured. When half of *Rated Current* (05.007) is applied in the d axis of the motor in each direction the inductance must change by at least $(K / (2 \times Full Scale Current K_c (11.061)))H$.

The specific reasons for each of the sub-trips are given in the table below.

Sub-trip	Reason
1	The inductance ratio or difference is too small when the drive has been started in sensorless mode.
2	The saturation characteristic of the motor cannot be measured when the drive has been started in sensorless mode.
3	The inductance ratio or difference is too small when an attempt is made to determine the location of the motor flux during a stationary auto-tune in RFC-S mode. This trip is also produced when the inductance ratio or inductance difference is too small when carrying out a phasing test on starting in RFC-S mode. If position feedback is being used the measured value for <i>Position Feedback Phase Angle</i> (03.025) may not be reliable. Also the measured values of <i>Ld</i> (05.024) and <i>No-load Lq</i> (05.072) may not correspond to the d and q axis respectively.
4	The direction of the flux in the motor is detected by the change of inductance with different currents. This trip is initiated if the change cannot be detected when an attempt is made to perform a stationary auto-tune when position feedback is being used, or to perform a phasing test on starting in RFC-S mode.

Trip	<i>Inductor Too Hot</i>
Value	93
Short description	

Regen inductor overload. See *Inductor Thermal Time Constant* (04.015).

Trip	<i>Inter-connect</i>
Value	103
Short description	

Multi-power module drive interconnection cable error. The sub-trip "xx.0.00" indicates which power module has detected the fault where xx is the power module number. This trip is also initiated if the number of modules present changes from the number of modules detected at power-up. In this case the sub-trip is the number of modules that are still communicating correctly.

Trip	<i>Island</i>
Value	160
Short description	

This trip indicates that a regen system is connected to an islanded supply. The sub-trips indicate the reason for the trip.

Sub-trip	Reason
1	Island detection system has been enabled and detected an island condition
2	The minimum synchronisation voltage is non-zero and the supply voltage has been below this threshold and been simulating its own supply synchronisation for more than 2.0s.

Recommended actions:

- Check the supply / supply connections to the regen drive.

Trip	<i>Keypad Mode</i>
Value	34
Short description	

If keypad reference mode is enabled (*Reference Selected Indicator* (01.049) = 4 or 6) (i.e. *Reference Selector* (01.014) is set to 4 or 6 if motor map 1 is selected, or *M2 Reference Selector* (21.003) is set to 4 or 6 if motor map 2 is selected) and the keypad removed, then this trip is initiated.

Recommended actions:

- Re-install keypad and reset.
- Change *Reference Selector* (01.014) to select the reference from another source.

Trip	<i>Line Sync</i>
Value	39
Short description	

This trip indicates that the inverter has lost the synchronization with the ac supply in Regen mode.

Recommended actions:

- Check the supply / supply connections to the regen drive.

Trip	<i>Low Load</i>
Value	38
Short description	

This trip is initiated if the low load detector is set up to produce a trip on low load detection and this condition occurs. See *Enable Trip On Low Load* (04.029).

Trip	<i>Motor Too Hot</i>
Value	20
Short description	

This trip indicates a motor thermal overload based on the *Rated Current* (05.007) and *Motor Thermal Time Constant 1* (04.015). *Motor Protection Accumulator* (04.019) displays the motor temperature as a percentage of the maximum value. The drive will trip on *Motor Too Hot* when *Motor Protection Accumulator* (04.019) gets to 100%.

Recommended actions:

- Ensure the load is not jammed / sticking.
- Check the load on the motor has not changed.
- If seen during an auto-tune test in RFC-S mode, ensure the *Rated Current* (05.007) is = Heavy duty current rating of the drive.
- Tune the *Rated Speed* (05.008) (RFC-A mode only).
- Check feedback signal for noise.
- Ensure the motor rated current is not zero.

Trip	Name Plate
Value	176
Short description	

This trip is initiated if there is a problem detected when an electronic name plate transfer from the motor to the drive is initiated. The reasons for the trip are given below:

Sub-trip	Reason	Details
1	A communication error with the encoder has been detected.	It is unlikely that this sub-trip will occur as most encoder errors will cause an encoder trip. It is possible that incorrect data in the nameplate could cause this trip, and so the nameplate data should be verified.
2	A data error has been detected in the nameplate. This is either because the number of entries is out of range, i.e. less than 1 or greater than 168, or the calculated CRC does not match the CRC from the nameplate.	Either there is no valid nameplate in the position feedback device or there is a data error in the nameplate area.
3	The exchange with the encoder has timed out.	If the encoder is connected to a drive interface, then this occurs because the encoder is not connected to the drive or is not initialised. If the encoder is connected to an option module interface, then this occurs because the position feedback interface (i.e. P1 or P2) is not present on the option module, or a suitable position feedback device is not selected, or because no device is connected, or it is not initialised.

Trip	None
Value	0
Short description	

No trip has been stored in this position in the trip log.

Trip	Oht Brake
Value	101
Short description	

This trip indicates that braking IGBT over-temperature has been detected based on firmware thermal model.

Recommended actions:

- Check braking resistor value is greater than or equal to the minimum resistance value.

Trip	Oht Control
Value	23
Short description	

This trip indicates that a control stage over-temperature has been detected. From the sub-trip "xyzz", the cause of the trip can be identified as follows:

Source	xx	y	zz
Control system	00	0	01: Control board thermistor 1
Control system	00	0	02: Control board thermistor 2
Control system	00	0	03: I/O board thermistor (or brake resistor thermistor)

Recommended actions:

- Check enclosure / drive fans are still functioning correctly.
- Check enclosure ventilation paths.
- Check enclosure door filters.
- Increase ventilation.
- Reduce the drive switching frequency.
- Check ambient temperature.

Trip	Oht dc bus
Value	27
Short description	

This trip indicates a DC bus component over temperature based on a firmware thermal model. The drive includes a thermal protection system to protect the DC bus components within the drive. This includes the effects of the output current and DC bus ripple. The estimated temperature is displayed as a percentage of the trip level in *Percentage Of d.c. Link Thermal Trip Level* (07.035). If this parameter reaches 100% then an *Oht dc bus* trip with sub-trip 200 is initiated. The drive will

attempt to stop the motor before tripping. If the motor does not stop in 10 seconds then the drive trips immediately.

Source	xx	y	zz
Control system	00	2	00: D.c. link thermal model gives {Oht dc bus} trip with sub-trip 0.

It is also possible in a multi-power module system for d.c. link over-temperature to be detected from within the power stage. From this source the estimated temperature as a percentage of trip is not available and the trip is indicated as follows:

Source	xx	y	zz
Control system	01	0	00: Power stage gives {Oht dc bus} trip with sub-trip 0.

Recommended actions:

- Check the AC supply voltage balance and levels.
- Check the DC bus ripple level.
- Reduce duty cycle.
- Reduce motor load.
- Check output current stability. If unstable;
 - Check the motor map settings with motor nameplate (*Rated Frequency* (05.006), *Rated Current* (05.007), *Rated Speed* (05.008), *Rated Voltage* (05.009), *Rated Power Factor* (05.010) and *Number Of Motor Poles* (05.011)) - (All modes).
 - Disable slip compensation (*Enable Slip Compensation* (05.027) = Off (0)) - (Open-loop).
 - Disable dynamic V to F operation (*Dynamic V To F Select* (05.013) = Off (0)) - (Open-loop).
 - Select fixed boost (*Open-loop Control Mode* (05.014) = Fixed (2)) - (Open-loop).
 - Select high stability space vector modulation (*High Stability Space Vector Modulation* (05.019) = On (1)) - (Open-loop).
 - Disconnect the load and complete a rotating auto-tune (*Auto-tune* (05.012) = 2) - (RFC-A and RFC-S).
 - Auto-tune the rated speed value (*Rated Speed Optimisation Select* (05.016) = 1) - (RFC-A and RFC-S).
 - Reduce speed loop gains (*Speed Controller Proportional Gain Kp1* (03.010), *Speed Controller Integral Gain Ki1* (03.011) and *Speed Controller Differential Feedback Gain Kd1* (03.012)) - (RFC-A and RFC-S).
 - Add a speed feedback filter value (*P1 Feedback Filter* (03.042)) - (RFC-A and RFC-S).
 - Add a current demand filter (*Current Reference Filter 1 Time Constant* (04.012)) - (RFC-A and RFC-S).
 - Check encoder signals for noise with an oscilloscope - (RFC-A and RFC-S).
 - Check encoder mechanical coupling - (RFC-A and RFC-S).

Trip	Oht Inverter
Value	21
Short description	

This trip indicates that an IGBT junction over-temperature has been detected based on a firmware thermal model. The sub-trip indicates which model has initiated the trip in the form xyyzz as given below.

Source	xx	y	zz
Control system	00	1	00: Inverter thermal model
Control system	00	3	00: Braking IGBT thermal model
Control system	00	4	00: Rectifier thermal model

Recommended actions with sub-trip 100:

- Reduce the selected drive switching frequency.
- Ensure *Auto-switching Frequency Change* (05.035) is set to Enabled (0).
- Reduce duty cycle.
- Decrease acceleration / deceleration rates.
- Reduce motor load.
- Check the DC bus ripple.
- Ensure all three input phases are present and balanced.

Recommended actions with sub-trip 300:

- Reduce the braking load.

Recommended actions with sub-trip 400:

- Check the AC supply voltage balance and levels.
- Check the DC bus ripple level.
- Reduce duty cycle.
- Reduce motor load.

Trip	Oht Power
Value	22
Short description	

This trip indicates that a power stage over-temperature has been detected. The sub-trip "xyzz" indicates which thermistor is indicating the over-temperature. The thermistor numbering is different for a single module type drive (i.e. no parallel board fitted) and a multi-module type drive (i.e. parallel board fitted with one or more power modules) as shown below:

Single module type drive:

Source	xx	y	zz
Power system	01	0	zz: Thermistor location defined by zz in the power board
Power system	01	Rectifier number	zz: Thermistor location defined by zz in the rectifier

Multi-module type system:

Source	xx	y	zz
Power system	Power module number	0	01: U phase power device
Power System	Power module number	0	02: V phase power device
Power system	Power module number	0	03: W phase power device
Power system	Power module number	0	04: Rectifier
Power system	Power module number	0	05: General power system
Power system	Power module number	0	00: Braking IGBT

Note that the power module that has caused the trip cannot be identified except for the braking IGBT temperature measurement

Recommended actions:

- Check enclosure / drive fans are still functioning correctly.
- Force the heatsink fans to run at maximum speed.
- Check enclosure ventilation paths.
- Check enclosure door filters.
- Increase ventilation.
- Reduce duty cycle.
- Decrease acceleration / deceleration rates.
- Reduce motor loads.
- Check the derating tables and confirm the drive is correctly sized for the application.
- Use a drive with larger current / power rating.

Trip	OI ac
Value	3
Short description	

This trip indicates that the instantaneous drive output current has exceeded the drive over current threshold.

Source	xx	y	zz
Control system	00	0	00: Instantaneous over-current trip when the measured a.c. current exceeds over current threshold
Power system	Power module number	0	00: Instantaneous over-current trip when the measured a.c. current exceeds over current threshold.

The over current threshold is the maximum current the drive can measure and is defined by VM_DRIVE_CURRENT[MAX].

Recommended actions:

- Acceleration / deceleration rate is too short.
- If seen during auto-tune reduce the voltage boost.
- Check for short circuit on the output cabling.
- Check integrity of the motor insulation using a Megger.
- Check feedback device wiring.
- Check feedback drive mechanical coupling.
- Check feedback signals are free from noise.
- Check motor cable is within limits for the frame size.
- Reduce the speed loop gains (*Speed Controller Proportional Gain Kp1* (03.010), *Speed Controller Integral Gain Ki1* (03.011), *Speed Controller Differential Feedback Gain Kd1* (03.012)).
- Check that the phase angle auto-tune has been completed (RFC-S mode only).
- Reduce the current loop gains (RFC-A and RFC-S modes only).

Trip	OI Brake
Value	4
Short description	

This trip indicates that an over-current has been detected in braking IGBT or braking IGBT protection has been activated. The braking IGBT over-current trip is detected within the power system. If the drive is a single module drive then there is no sub-trip. If the drive is a multi-power module drive the following sub-trip is used to indicate the source of the trip.

Source	xx	y	zz
Power system	Power module number	0	00: Braking IGBT instantaneous over-current trip

Recommended actions:

- Check brake resistor wiring.
- Check braking resistor value is greater than or equal to the minimum resistance value.
- Check braking resistor insulation.

Trip	OI dc
Value	109
Short description	

This trip indicates that the short circuit protection for the drive output stage has been activated. The table below shows where the trip has been detected.

Source	xx	y	zz
Control system	00	0	00
Power system	Power module number	0	00

Recommended actions:

- Disconnect the motor cable at the drive end and check the motor and cable insulation with a Megger.
- Replace the drive.

Trip	OI Snubber
Value	92
Short description	

This trip indicates that an over-current condition has been detected in the rectifier snubbing circuit, The exact cause of the trip can be identified by the sub-trip number.

Source	xx	y	zz
Power system	01	Rectifier number*	00: Rectifier snubber over-current trip detected.

*For a parallel power-module system the rectifier number will be one as it is not possible to determine which rectifier has detected the fault.

Recommended actions:

- Ensure the internal EMC filter is installed.
- Ensure the motor cable length does not exceed the maximum for selected switching frequency.
- Check for supply voltage imbalance.
- Check for supply disturbance such as notching from a DC drive.
- Check the motor and motor cable insulation with a Megger.
- Fit an output line reactor or sinusoidal filter.

Trip	Option Disable
Value	215
Short description	

During drive mode changeover option modules must acknowledge that they have stopped accessing the communications system between the option slots and the drive. If an option module does not do this in the allowed time then this trip is produced.

Recommended actions:

- Reset the trip.
- If the trip persists, replace the option module.

Trip	Out Phase Loss
Value	98
Short description	

This trip indicates that phase loss has been detected at the drive output.

Sub-trip	Reason
1	U phase output not connected when drive is enabled*
2	V phase output not connected when drive is enabled*
3	W phase output not connected when drive is enabled*
4	Output phase loss detected when the drive is running
5	U phase lower IGBT failure detection on drive enable
6	V phase lower IGBT failure detection on drive enable
7	W phase lower IGBT failure detection on drive enable

*These sub-trips could also indicate that the upper IGBT has failed in the indicated phase.

Note that if *Reverse Output Phase Sequence* (05.042) = 1 the physical output phases are reversed, and so sub-trip 3 refers to physical output phase V and sub-trip 2 refers to physical output phase W.

Recommended actions:

- Check motor and drive connections.
- To disable the trip set *Output Phase Loss Detection Enable* (06.059) to zero.

Trip	Over Speed
Value	7
Short description	

In open-loop mode, if the *Output Frequency* (05.001) exceeds the threshold set in *Over Speed Threshold* (03.008) in either direction, an *Over Speed* trip is

produced. In RFC-A and RFC-S modes, if the *Speed Feedback* (03.002) exceeds the threshold set in *Over Speed Threshold* (03.008) in either direction, an *Over Speed* trip is produced. If *Over Speed Threshold* (03.008) is set to 0.0 the threshold is then equal to 1.2 x the value set in *Maximum Reference Clamp* (01.006).

In RFC-A and RFC-S modes if an SSI encoder is being used and *P1 SSI Incremental Mode* (03.047) is set to Off, an *Over Speed* trip will be produced when the encoder passes through the boundary between its maximum position and zero.

Recommended actions:

- Reduce the *Speed Controller Proportional Gain Kp1* (03.010) to reduce the speed overshoot (RFC-A and RFC-S modes only).
- If an SSI encoder is being used, set *P1 SSI Incremental Mode* (03.047) to On.

The above description relates to a standard over speed trip, however in RFC-S mode it is possible to produce an Overspeed trip with sub-trip 1. This is caused if the speed is allowed to exceed the safe level in RFC-S mode with flux weakening. See *Enable High Speed Mode* (05.022) for details.

Trip	Over Volts
Value	2
Short description	

This trip indicates that the DC bus voltage has exceeded VM_DC_VOLTAGE[MAX] or VM_DC_VOLTAGE_SET[MAX] for 15s. The trip threshold varies depending on voltage rating of the drive as shown below.

Voltage rating	VM_DC_VOLTAGE[MAX]	VM_DC_VOLTAGE_SET[MAX]
200	415	410
400	830	815
575	990	970
690	1190	1175

The exact cause of the trip can be identified by the sub-trip number.

Source	xx	y	zz
Control system	00	0	01: Instantaneous trip when the d.c. link voltage exceeds VM_DC_VOLTAGE[MAX].
Control system	00	0	02: Time delayed trip indicating that the d.c. link voltage is above VM_DC_VOLTAGE_SET[MAX].

Recommended actions:

- Increase deceleration ramp.
- Decrease the braking resistor value (staying above the minimum value).
- Check nominal AC supply level.
- Check for supply disturbances which could cause the DC bus level to rise.
- Check motor insulation using a Megger.

Trip	Phase Loss
Value	32
Short description	

This trip indicates that the drive has detected an input phase loss or large supply imbalance. Phase loss can be detected directly from the supply where the drive has a thyristor base charge system (Frame size 7 and above). If phase loss is detected using this method the drive trips immediately and the xx part of the sub-trip is set to 01. In all sizes of drive phase loss is also detected by monitoring the ripple in the d.c. link voltage in which case the drive attempts to stop the drive before tripping unless bit 2 of *Action On Trip Detection* (10.037) is set to one. When phase loss is detected by monitoring the ripple in the d.c. link voltage the xx part of the sub-trip is zero.

Source	xx	y	zz
Control system	00	0	00: Phase loss detected from d.c. link ripple
Power system (1)	01	Rectifier number (2)	00: Phase loss detected directly from the supply

(1) Input phase loss detection can be disabled when the drive required to operate from the DC supply or from a single phase supply in *Input Phase Loss Detection Mode* (06.047).

(2) For a parallel power-module system the rectifier number will be one as it is not possible to determine which rectifier has detected the fault.

This trip does not occur in regen mode.

Recommended actions:

- Check that the input power supply connections are good and tightened correctly.
- Check the AC supply voltage balance and level at full load.
- Check the DC bus ripple level with an isolated oscilloscope.
- Check the output current stability.
- Reduce the duty cycle.
- Reduce the motor load.
- Disable the phase loss detection by setting *Input Phase Loss Detection Mode* (06.047) to Disabled.

Trip	Power Comms
Value	90
Short description	

A Power Comms trip indicates a communications problem within the power system of the drive. The reason for the trip can be identified by the sub-trip number.

Type of drive	xx	y	zz
Single power module system	01	Rectifier number*	00: Excessive communications errors detected by the rectifier module.

*For a parallel power-module system the rectifier number will be one as it is not possible to determine which rectifier has detected the fault.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	Power Data
Value	220
Short description	

This trip can be generated either from the drive control system or from the power system.

This trip is produced if there is an error in the configuration data stored in the power system. If the source of the trip is the control system then the trip related to the table that is uploaded from the power system at power-up.

Source	xx	y	zz
Control system	00	0	02: There is no data table to be uploaded to the control board.
Control system	00	0	03: The power system data table is bigger than the space available in the control pod to store it.
Control system	00	0	04: The size of the table given in the table is incorrect
Control system	00	0	05: Table CRC error.
Control system	00	0	06: The version number of the generator software that produced the table is too low, i.e. a table from a newer generator is required that includes features that have been added to the table that may not be present.
Control system	00	0	07: The power board data table does not match the power board hardware identifier.
Power system	01	0	00: The power data table used internally by the power module has an error. (For a multi-power module drive this indicates any error with the code tables in the power system.)
Power system	01	0	01: The power data table that should be uploaded to the control system on power up has an error.
Power system	01	0	02: The power data table used internally by the power module does not match the hardware identification of the power module.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	Power Down Save
Value	37
Short description	

This trip indicates that an error has been detected in the power down save parameters stored in non-volatile memory.

Recommended actions:

- Perform a 1001 save in Pr *mm.000* to ensure that the trip doesn't occur the next time the drive is powered up.

Trip	PSU
Value	5
Short description	

This trip indicates that one or more internal power supply rails are outside limits or overloaded.

Source	xx	Y	zz
Control system	00	0	00: Internal power supply overload.
Power system	Power module number	Rectifier number*	00: Rectifier internal power supply overload.

*For a parallel power-module system the rectifier number will be zero as it is not possible to determine which rectifier has detected the fault.

Recommended actions:

- Remove any option modules and perform a reset.
- Remove encoder connection and perform a reset.
- Hardware fault within the drive - return the drive to the supplier.

Trip	PSU 24V
Value	9
Short description	

The total user load of the drive and option modules has exceeded the internal 24V power supply limit. The user load consists of the drive digital outputs and main

encoder supply.

Recommended actions:

- Reduce the load and reset.
- Provide an external 24V power supply on control terminal 2.
- Remove all option modules.

Trip	Rating Mismatch
Value	223
Short description	

This trip indicates that there is a voltage rating or current rating mismatch in a multi-module drive system. This trip is only applicable to modular drives that are connected in parallel. A mixture of power modules with different voltage or current ratings within the same multi-module drive system is not allowed and will cause a *Rating Mismatch* trip.

Recommended actions:

- Ensure that all modules in a multi-modular drive system are of the same frame size and rating (voltage and current).
- Hardware fault - contact the supplier of the drive.

Trip	Rectifier Set-up
Value	94
Short description	

A rectifier has not been set-up correctly in a multi-power module system.

Recommended actions:

- Check the inter-power module wiring

Trip	Reserved 001
Value	1
Short description	

This trip value is used in Unidrive SP for an under voltage trip. The under voltage condition is now a drive state, and so this trip is no longer used by the drive.

This is not a valid trip number as this value is used in *User Trip* (10.038) to reset the drive.

Trip	Reset Logs
Value	255
Short description	

This is not a valid trip number as this value is used in *User Trip* (10.038) to reset the trip logs.

Trip	Resistance
Value	33
Short description	

This trip indicates that either the value being used for motor stator resistance is too high or that an attempt to do a test involving measuring motor stator resistance has failed. The maximum for the stator resistance parameters is generally higher than the maximum value that can be used in the control algorithms. If the value exceeds $(V_{FS} / \sqrt{2}) / \text{Full Scale Current } Kc$ (11.061), where V_{FS} is the full scale d.c. link voltage defined by VM_DC_VOLTAGE, then this trip is initiated. If the value is the result of a measurement made by the drive then sub-trip 1 is applied, or if it is because the parameter has been changed by the user then sub-trip 3 is applied. During the stator resistance section of auto-tuning an additional test is performed to measure the drive inverter characteristics to provide the compensation necessary for dead-times. If the inverter characteristic measurement fails then sub-trip 2 is applied.

Sub-trip	Reason
1	Measured stator resistance exceeded the allowed range
2	It was not possible to measure the inverter characteristic
3	The stator resistance associated with the presently selected motor map exceeds the allowed range

Recommended actions:

- Check that a value has not been entered in the stator resistance for the presently selected motor map does not exceed the allowed range.
- Check the motor cable / connections.
- Check the integrity of the motor stator winding using an insulation tester.
- Check the motor phase to phase resistance at the drive terminals.
- Check the motor phase to phase resistance at the motor terminals.
- Ensure the stator resistance of the motor falls within the range of the drive model.
- Select fixed boost mode (*Open-loop Control Mode* (05.014) = Fixed) and verify the output current waveforms with an oscilloscope.
- Replace the motor.

Trip	Slot1 Different
Value	204
Short description	

If the option module fitted in option slot 1 is different to the option module present at the last power-down then this trip is produced. The sub-trip number gives the identification code of the module that was originally fitted. The priority order for the option module different trips is *Slot1 Different* highest, then *Slot2 Different*, then *Slot3 Different* then *Slot4 Different*. Drive user parameters must be saved to prevent this trip on the next power-up if the module has changed. If the menus have been changed, but not the module, the trip will not occur on the next power-up. The sub-trip number gives the following indications of the reason for the trip.

Sub-trip	Reason
1	No module was fitted previously
2	A module with the same identifier is fitted, but the set-up menu for this option slot has been changed, and so default parameters have been loaded for this menu.
3	A module with the same identifier is fitted, but the applications menu for this option slot has been changed, and so default parameters have been loaded for this menu.
4	A module with the same identifier is fitted, but the set-up and applications menu for this option slot have been changed, and so default parameters have been loaded for these menus.
>99	Shows the identifier of the module previously fitted.

Recommended actions:

- Turn off the power, ensure the correct option modules are installed in the correct option slots and re-apply the power.
- Confirm that the currently installed option module is correct, ensure option module parameters are set correctly and perform a user save in Pr mm.000.

Trip	Slot1 Error
Value	202
Short description	

The option module in option slot 1 has indicated an error. The option module can give the reason for the error and this is shown in the sub-trip number. As default the sub-trip number is shown as a number on the display, however, it is possible for the option module to supply sub-trip number strings which will be displayed instead of the number if available.

Recommended actions:

- See relevant *Option Module User Guide* for details of the trip.

Trip	Slot1 HF
Value	200
Short description	

This trip indicates that there is a fault with the option module in option slot 1 that means that this module cannot operate. The possible causes of the trip are given by the sub-trip value.

Sub-trip	Reason
1	The module category cannot be identified
2	All the required customisable menu table information has not been supplied or the tables supplied are corrupt
3	There is insufficient memory available to allocate the comms buffers for this module.
4	The module has not indicated that it is running correctly during drive power-up
5	The module has been removed after power-up or it has ceased to indicate to the drive processor that it is still active.
6	The module has not indicated that it has stopped accessing drive parameters during a drive mode change
7	The module has failed to acknowledge that a request has been made to reset the drive processor.
8	The drive failed to read correctly the menu table from the module during drive power-up.
9	The drive failed to upload menu tables from the module and timed-out (5s).
10	Menu table CRC invalid.

Recommended actions:

- Ensure the option module is installed correctly.
- Replace the option module.
- Replace the drive.

Trip	Slot1 Not Fitted
Value	203
Short description	

Each option module fitted in the drive is identified at power-up and the option fitted is stored by the drive in its non-volatile memory. If an option module was fitted in slot 1 at power-down, but that option module has subsequently been removed before power up then this trip is produced. The sub-trip number gives the identification code of the option module that has been removed. The priority order for the option module not fitted trips is *Slot1 Not Fitted* highest, then *Slot2 Not Fitted*, then *Slot3 Not Fitted* then *Slot4 Not Fitted*. Drive user parameters must be saved to prevent this trip on the next power-up.

Recommended actions:

- Ensure the option module is installed correctly.
- Re-install the option module.
- To confirm that the removed option module is no longer required perform a save function in Pr *mm.000*.

Trip	Slot1 Watchdog
Value	201
Short description	

This trip indicates that the option module in option slot 1 has started the option watchdog function and then failed to service this watchdog correctly.

Recommended actions:

- Replace the option module.

Trip	Slot2 Different
Value	209
Short description	

If the option module fitted in option slot 2 is different to the option module present at the last power-down then this trip is produced. The sub-trip number gives the identification code of the module that was originally fitted. The priority order for the option module different trips is *Slot1 Different* highest, then *Slot2 Different*, then *Slot3 Different* then *Slot4 Different*. Drive user parameters must be saved to prevent this trip on the next power-up if the module has changed. If the menus have been changed, but not the module, the trip will not occur on the next power-up. The sub-trip number gives the following indications of the reason for the trip.

Sub-trip	Reason
1	No module was fitted previously
2	A module with the same identifier is fitted, but the set-up menu for this option slot has been changed, and so default parameters have been loaded for this menu.
3	A module with the same identifier is fitted, but the applications menu for this option slot has been changed, and so default parameters have been loaded for this menu.
4	A module with the same identifier is fitted, but the set-up and applications menu for this option slot have been changed, and so default parameters have been loaded for these menus.
>99	Shows the identifier of the module previously fitted.

Recommended actions:

- Turn off the power, ensure the correct option modules are installed in the correct option slots and re-apply the power.
- Confirm that the currently installed option module is correct, ensure option module parameters are set correctly and perform a user save in Pr *mm.000*.

Trip	Slot2 Error
Value	207
Short description	

The option module in option slot 2 has indicated an error. The option module can give the reason for the error and this is shown in the sub-trip number. As default the sub-trip number is shown as a number on the display, however, it is possible for the option module to supply sub-trip number strings which will be displayed instead of the number if available.

Recommended actions:

- See relevant *Option Module User Guide* for details of the trip.

Trip	Slot2 HF
Value	205
Short description	

This trip indicates that there is a fault with the option module in option slot 2 that means that this module cannot operate. The possible causes of the trip are given by the sub-trip value.

Sub-trip	Reason
1	The module category cannot be identified
2	All the required customisable menu table information has not been supplied or the tables supplied are corrupt
3	There is insufficient memory available to allocate the comms buffers for this module.
4	The module has not indicated that it is running correctly during drive power-up
5	The module has been removed after power-up or it has ceased to indicate to the drive processor that it is still active.
6	The module has not indicated that it has stopped accessing drive parameters during a drive mode change
7	The module has failed to acknowledge that a request has been made to reset the drive processor.
8	The drive failed to read correctly the menu table from the module during drive power-up.
9	The drive failed to upload menu tables from the module and timed-out (5s).
10	Menu table CRC invalid.

Recommended actions:

- Ensure the option module is installed correctly.
- Replace the option module.
- Replace the drive.

Trip	Slot2 Not Fitted
Value	208
Short description	

Each option module fitted in the drive is identified at power-up and the option fitted is stored by the drive in its non-volatile memory. If an option module was fitted in slot 2 at power-down, but that option module has subsequently been removed before power up then this trip is produced. The sub-trip number gives the identification code of the option module that has been removed. The priority order for the option module not fitted trips is *Slot1 Not Fitted* highest, then *Slot2 Not Fitted*, then *Slot3 Not Fitted* then *Slot4 Not Fitted*. Drive user parameters must be saved to prevent this trip on the next power-up.

Recommended actions:

- Ensure the option module is installed correctly.
- Re-install the option module.
- To confirm that the removed option module is no longer required perform a save function in Pr *mm.000*.

Trip	Slot2 Watchdog
Value	206
Short description	

This trip indicates that the option module in option slot 2 has started the option watchdog function and then failed to service this watchdog correctly.

Recommended actions:

- Replace the option module.

Trip	Slot3 Different
Value	214
Short description	

If the option module fitted in option slot 3 is different to the option module present at the last power-down then this trip is produced. The sub-trip number gives the identification code of the module that was originally fitted. The priority order for the option module different trips is *Slot1 Different* highest, then *Slot2 Different*, then *Slot3 Different* then *Slot4 Different*. Drive user parameters must be saved to prevent this trip on the next power-up if the module has changed. If the menus have been changed, but not the module, the trip will not occur on the next power-up. The sub-trip number gives the following indications of the reason for the trip.

Sub-trip	Reason
1	No module was fitted previously
2	A module with the same identifier is fitted, but the set-up menu for this option slot has been changed, and so default parameters have been loaded for this menu.
3	A module with the same identifier is fitted, but the applications menu for this option slot has been changed, and so default parameters have been loaded for this menu.
4	A module with the same identifier is fitted, but the set-up and applications menu for this option slot have been changed, and so default parameters have been loaded for these menus.
>99	Shows the identifier of the module previously fitted.

Recommended actions:

- Turn off the power, ensure the correct option modules are installed in the correct option slots and re-apply the power.
- Confirm that the currently installed option module is correct, ensure option module parameters are set correctly and perform a user save in Pr *mm.000*.

Trip	Slot3 Error
Value	212
Short description	

The option module in option slot 3 has indicated an error. The option module can give the reason for the error and this is shown in the sub-trip number. As default the sub-trip number is shown as a number on the display, however, it is possible for the option module to supply sub-trip number strings which will be displayed instead of the number if available.

Recommended actions:

- See relevant *Option Module User Guide* for details of the trip.

Trip	Slot3 HF
Value	210
Short description	

This trip indicates that there is a fault with the option module in option slot 3 that means that this module cannot operate. The possible causes of the trip are given by the sub-trip value.

Sub-trip	Reason
1	The module category cannot be identified
2	All the required customisable menu table information has not been supplied or the tables supplied are corrupt
3	There is insufficient memory available to allocate the comms buffers for this module.
4	The module has not indicated that it is running correctly during drive power-up
5	The module has been removed after power-up or it has ceased to indicate to the drive processor that it is still active.
6	The module has not indicated that it has stopped accessing drive parameters during a drive mode change
7	The module has failed to acknowledge that a request has been made to reset the drive processor.
8	The drive failed to read correctly the menu table from the module during drive power-up.
9	The drive failed to upload menu tables from the module and timed-out (5s).
10	Menu table CRC invalid.

Recommended actions:

- Ensure the option module is installed correctly.
- Replace the option module.
- Replace the drive.

Trip	Slot3 Not Fitted
Value	213
Short description	

Each option module fitted in the drive is identified at power-up and the option fitted is stored by the drive in its non-volatile memory. If an option module was fitted in slot 3 at power-down, but that option module has subsequently been removed before power up then this trip is produced. The sub-trip number gives the identification code of the option module that has been removed. The priority order for the option module not fitted trips is *Slot1 Not Fitted* highest, then *Slot2 Not Fitted*, then *Slot3 Not Fitted* then *Slot4 Not Fitted*. Drive user parameters must be saved to prevent this trip on the next power-up.

Recommended actions:

- Ensure the option module is installed correctly.
- Re-install the option module.
- To confirm that the removed option module is no longer required perform a save function in Pr *mm.000*.

Trip	Slot3 Watchdog
Value	211
Short description	

This trip indicates that the option module in option slot 3 has started the option watchdog function and then failed to service this watchdog correctly.

Recommended actions:

- Replace the option module.

Trip	Slot4 Different
Value	254
Short description	

If the option module fitted in option slot 4 is different to the option module present at the last power-down then this trip is produced. The sub-trip number gives the identification code of the module that was originally fitted. The priority order for the option module different trips is *Slot1 Different* highest, then *Slot2 Different*, then *Slot3 Different* then *Slot4 Different*. Drive user parameters must be saved to prevent this trip on the next power-up if the module has changed. If the menus have been changed, but not the module, the trip will not occur on the next power-up. The sub-trip number gives the following indications of the reason for the trip.

Sub-trip	Reason
1	No module was fitted previously
2	A module with the same identifier is fitted, but the set-up menu for this option slot has been changed, and so default parameters have been loaded for this menu.
3	A module with the same identifier is fitted, but the applications menu for this option slot has been changed, and so default parameters have been loaded for this menu.
4	A module with the same identifier is fitted, but the set-up and applications menu for this option slot have been changed, and so default parameters have been loaded for these menus.
>99	Shows the identifier of the module previously fitted.

Recommended actions:

- Turn off the power, ensure the correct option modules are installed in the correct option slots and re-apply the power.
- Confirm that the currently installed option module is correct, ensure option module parameters are set correctly and perform a user save in Pr *mm.000*.

Trip	Slot4 Error
Value	252
Short description	

The option module in option slot 4 has indicated an error. The option module can give the reason for the error and this is shown in the sub-trip number. As default the sub-trip number is shown as a number on the display, however, it is possible for the option module to supply sub-trip number strings which will be displayed instead of the number if available.

Recommended actions:

- See relevant *Option Module User Guide* for details of the trip.

Trip	Slot4 HF
Value	250
Short description	

This trip indicates that there is a fault with the option module in option slot 4 that means that this module cannot operate. The possible causes of the trip are given by the sub-trip value.

Sub-trip	Reason
1	The module category cannot be identified
2	All the required customisable menu table information has not been supplied or the tables supplied are corrupt
3	There is insufficient memory available to allocate the comms buffers for this module.
4	The module has not indicated that it is running correctly during drive power-up
5	The module has been removed after power-up or it has ceased to indicate to the drive processor that it is still active.
6	The module has not indicated that it has stopped accessing drive parameters during a drive mode change
7	The module has failed to acknowledge that a request has been made to reset the drive processor.
8	The drive failed to read correctly the menu table from the module during drive power-up.
9	The drive failed to upload menu tables from the module and timed-out (5s).
10	Menu table CRC invalid.

Recommended actions:

- Ensure the option module is installed correctly.
- Replace the option module.
- Replace the drive.

Trip	Slot4 Not Fitted
Value	253
Short description	

Each option module fitted in the drive is identified at power-up and the option fitted is stored by the drive in its non-volatile memory. If an option module was fitted in slot 4 at power-down, but that option module has subsequently been removed before power up then this trip is produced. The sub-trip number gives the identification code of the option module that has been removed. The priority order for the option module not fitted trips is *Slot1 Not Fitted* highest, then *Slot2 Not Fitted*, then *Slot3 Not Fitted* then *Slot4 Not Fitted*. Drive user parameters must be saved to prevent this trip on the next power-up.

Recommended actions:

- Ensure the option module is installed correctly.
- Re-install the option module.
- To confirm that the removed option module is no longer required perform a save function in Pr *mm.000*.

Trip	Slot4 Watchdog
Value	251
Short description	

This trip indicates that the option module in option slot 4 has started the option watchdog function and then failed to service this watchdog correctly.

Recommended actions:

- Replace the option module.

Trip	Slot App Menu
Value	216
Short description	

This trip indicates that more than one option slot has requested to customize application menus 18, 19 and 20. The sub-trip number indicates which option slot has been allowed to customize the menus.

Recommended actions:

- Ensure that only one of the Application modules is configured to customize the application menus 18, 19 and 20.

Trip	Soft Start
Value	226
Short description	

This trip indicates that the soft start relay in the drive has failed to close or the soft start monitoring circuit has failed.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	Stored HF
Value	221
Short description	

If an HF01 to HF19 trip occurs then a *Stored HF* trip occurs each time the drive is powered up until this trip is reset. The sub-trip code is the number of the original HF trip. The *Stored HF* trip can only be reset by first writing 1299 to Pr *mm.000* and resetting the drive.

Recommended actions:

- Enter 1299 into Pr *mm.000* and press reset to clear the trip.

Trip	Sub-array RAM
Value	227
Short description	

An option module, derivative image or user program image has requested more parameter RAM than is allowed. The RAM allocation is checked in order of resulting sub-trip numbers, and so the failure with the highest sub-trip number is given. The sub-trip is calculated as (parameter size x 1000) + (parameter type x 100) + sub-array number. Note that if this trip occurs, all menu customisation provided by option modules, the derivative image or the user program image is not used. The tables below show the values corresponding to the parts of the sub-trip number.

Parameter size	Value
1 bit	1
8 bit	2
16 bit	3
32 bit	4
64 bit	5

Parameter type	Value
Volatile	0
User save	1
Power-down save	2

Sub-array	Menus	Value
Applications menus	18-20	1
Derivative image	29	2
User program image	30	3
Option slot 1 set-up	15	4
Option slot 1 applications	25	5
Option slot 2 set-up	16	6
Option slot 2 applications	26	7
Option slot 3 set-up	17	8
Option slot 3 applications	27	9
Option slot 4 set-up	24	10
Option slot 4 applications	28	11

Trip	Temp Feedback
Value	218
Short description	

This trip indicates a fault with a thermistor in the drive (i.e. open circuit or short circuit).

Source	xx	y	zz
Control board	00	00	01: Control board thermistor 1 02: Control board thermistor 2 03: I/O board thermistor:
Power system	Power module number	0	Zero for temperature feedback provided via power system comms. 21, 22 and 23 for direct ELV temperature feedback.
Power system	01	Rectifier number*	Always zero

*For a parallel power-module system the rectifier number will be one as it is not possible to determine which rectifier has detected the fault.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	<i>Th Brake Res</i>
Value	10
Short description	

If hardware based braking resistor thermal monitoring is provided and the resistor overheats this trip is initiated. If the braking resistor is not present then this trip must be disabled with bit 3 of *Action On Trip Detection* (10.037) to prevent this trip.

Recommended actions:

- Check braking resistor wiring.
- Check braking resistor value is greater than or equal to the minimum resistance value.
- Check braking resistor insulation.

Trip	<i>Th Short Circuit</i>
Value	25
Short description	

This trip indicates that a temperature sensor connected to an analogue input or terminal 15 on the position feedback interface has a low impedance (i.e. < 50 Ohms). The cause of the trip can be identified by the sub-trip number.

Sub-trip	Source
1	Analogue input 1
2	Analogue input 2
3	Analogue input 3
4	Position feedback interface

Recommended actions:

- Check temperature feedback connection.
- Replace sensor.

Trip	<i>Thermistor</i>
Value	24
Short description	

This trip indicates that a temperature sensor connected to one of the analogue inputs or terminal 15 on the position feedback interface (15 way D-type connector) has indicated an over-temperature. The source of the trip can be identified by the sub-trip number.

Sub-trip	Source
1	Analogue input 1
2	Analogue input 2
3	Analogue input 3
4	Position feedback interface

Recommended actions:

- Check why the temperature measured by the sensor is too high temperature.
- Check temperature sensor connection.

Trip	Undefined
Value	110
Short description	

This trip indicates that the power system has generated but did not identify the trip from the power system. The cause of the trip is unknown.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	User 24V
Value	91
Short description	

This trip is initiated if *User Supply Select* (06.072) = 1 or *Low Under Voltage Threshold Select* (06.067) = 1 or *Backup Supply Mode Enable* (06.068) = 1 and no user 24V present on the user 24V input.

Recommended actions:

- Ensure that the user 24V supply is present on the control terminals.

Trip	User Prog Trip
Value	96
Short description	

This trip can be initiated from within an onboard user program using a function call which defines the sub-trip number.

Recommended actions:

- Check the user program.

Trip	User Program
Value	249
Short description	

An error has been detected in the onboard user program image. The sub-trip indicated the reason for the trip.

Sub-trip	Reason	Comments
1	Divide by zero	
2	Undefined trip	
3	Attempted fast parameter access set-up with non-existent parameter	
4	Attempted access to non-existent parameter	
5	Attempted write to read-only parameter	
6	Attempted an over-range write	
7	Attempted read from write-only parameter	
30	The image has failed because either its CRC is incorrect, or there are less than 6 bytes in the image or the image header version is less than 5.	Occurs when the drive powers-up or the image is programmed. The image tasks will not run.
31	The image requires more RAM for heap and stack than can be provided by the drive.	As 30.
32	The image requires an OS function call that is higher than the maximum allowed.	As 30.
33	The ID code within the image is not valid	As 30.
40	The timed task has not completed in time and has been suspended.	<i>Onboard User Program: Enable (11.047)</i> is reset to zero when the trip is initiated.
41	Undefined function called, i.e. a function in the host system vector table that has not been assigned.	As 40.
52	Customisable menu table CRC check failed	As 30.
53	Customisable menu table changed	Occurs when the drive powers-up or the image is programmed and the table has changed. Defaults are loaded for the user program menu and the trip will keep occurring until drive parameters are saved.
80	*Image is not compatible with the control board	Initiated from within the image code.
81	*Image is not compatible with the control board serial number	As 80.
100	Image has detected and prevented attempted pointer access outside of the IEC task's heap area.	
101	Image has detected and prevented misaligned pointer usage.	

102	Image has detected an array bounds violation and prevented its access.	
103	Image has attempted to convert a data type to or from an unknown data type, has failed and has shut itself down.	
104	Image has attempted to use an unknown user service function.	
200	User program has invoked a "divide" service with a denominator of zero. (Note that this is raised by the downloaded image and has therefore been given a distinct error code despite being the same fundamental problem as sub-trip 1.)	
201	Parameter access is not supported. An attempt to read database other than the host drive.	
202	Parameter does not exist. Database was host drive but the specified parameter does not exist.	
203	Parameter is read-only.	
204	Parameter is write-only.	
205	Unknown parameter error.	
206	Invalid bit present in parameter. The parameter does not contain the specified bit.	
207	Parameter format lookup failed. Failed to get parameter information data.	
208	An over-range write has been attempted.	

The following table gives the differences when compared to the derivative product image.

Sub-trip	Difference
40, 41	<i>Onboard User Program: Enable (11.047)</i> is reset to zero when the trip is initiated.
51	Not applicable as core menu customisation not allowed
6x	Not applicable as option module restrictions not allowed
7x	Not applicable as option module restrictions not allowed
100	Image has detected and prevented attempted pointer access outside of the IEC task's heap area.
101	Image has detected and prevented misaligned pointer usage.
102	Image has detected an array bounds violation and prevented its access.
103	Image has attempted to convert a data type to or from an unknown data type, has failed and has shut itself down.
104	Image has attempted to use an unknown user service function.
200	User program has invoked a "divide" service with a denominator of zero. (Note that this is raised by the downloaded image and has therefore been given a distinct error code despite being the same fundamental problem as sub-trip 1.)

Trip	User Save
Value	36
Short description	

This trip indicates that an error has been detected in the user save parameters saved in non-volatile memory. For example, following a user save command, if the power to the drive was removed when the user parameters were being saved.

Recommended actions:

- Perform a user save in Pr *mm.000* to ensure that the trip doesn't occur the next time the drive is powered up.
- Ensure that the drive has enough time to complete the save before removing the power to the drive.

Trip	User Trip 40

Value	159
Short description	

This trip is not used by the drive and can be used for a user trip.

Trip	Voltage Range
Value	169
Short description	

This trip is initiated if the *Regen Minimum Voltage* (03.026) is set to a non-zero value and the supply voltage is outside the range defined by *Regen Maximum Voltage* (03.027) for more than 100ms.

Recommended actions:

- Ensure the supply voltage is operating within the drive specification.
- Ensure *Regen Minimum Voltage* (03.026) and *Regen Maximum Voltage* (03.027) are set correctly.
- Check the supply voltage waveform using an oscilloscope.
- Reduce the level of supply disturbance.
- Set *Regen Maximum Voltage* (03.027) to zero to disable this trip.

Trip	Watchdog
Value	30
Short description	

This trip indicates that the control word watchdog has been enabled and has timed out.
