Parameter mm.000

Parameter mm.000 (mm.000) is one parameter that can be accessed from every drive menu so that the user can initiate various actions by setting a value in this parameter and then performing a drive reset. If the action is completed successfully parameter mm.000 is cleared when the action is complete. If the action is not started because the value does not correspond to an action, or because the action is not allowed (i.e. an attempt is made to load defaults and the drive is enabled), parameter mm.000 is not cleared. If the action is started and then fails a trip is produced and parameter mm.000 is not cleared.

There could be some conflict between the actions of *Parameter mm.000* (mm.000) and *Parameter Cloning* (11.042) when the drive is reset. If *Parameter Cloning* (11.042) has a value of 1 or 2 and a valid action is required from the value of parameter mm.000 then only the action required by parameter mm.000 is performed, but on successful completion of the action both parameters are cleared. If *Parameter Cloning* (11.042) has any other value it is not affected.

The table below shows the possible actions that can be initiated with *Parameter mm.000* (mm.000).

Parameter mm.000 (mm.000) value	Action	Possible failures
1001	Save drive user save parameters to non-volatile memory. Power-down save parameters are saved when the drive enters the under voltage state.	No action if the drive is in the under voltage state
1000	Save drive parameters to non-volatile memory. It should be noted that power-down save parameters are also saved which will result in one background task scan being extended to 200ms.	
1070	Reset all option modules	
1233	Load 50Hz defaults	No action if the drive is enabled
1234	Load 50Hz defaults to all menus except option module menus (i.e 15 to 20 and 24 to 28)	No action if the drive is enabled
1244	Load 60Hz defaults	No action if the drive is enabled
1245	Load 60Hz defaults to all menus except option module menus (i.e 15 to 20 and 24 to 28)	No action if the drive is enabled
1299	Reset <i>Stored HF</i> trip.	
2001	Create a boot file on a non-volatile media card based on the present drive parameters including all Menu 20 parameters	Non-volatile media card trips
4xxx	NV media card: Transfer the drive parameters to parameter file xxx	Non-volatile media card trips
5xxx	NV media card: Transfer the onboard user program to onboard user program file xxx	Non-volatile media card trips
6xxx	NV media card: Load the drive parameters from parameter file xxx or the onboard user program from onboard user program file xxx	No action if the drive is enabled Non-volatile media card trips
7xxx	NV media card: Erase file xxx	Non-volatile media card trips
8xxx	NV Media card: Compare the data in the drive with file xxx	Non-volatile media card trips
9555	NV media card: Clear the warning suppression flag	Non-volatile media card trips
9666	NV media card: Set the warning suppression flag	Non-volatile media card trips
9777	NV media card: Clear the read-only flag	Non-volatile media card trips
9888	NV media card: Set the read-only flag	Non-volatile media card trips
9999	NV media card: Erase and format the NV media card	Non-volatile media card trips
12000	Only display parameters that are different from their default value. This action does not require a drive reset.	
12001	Only display parameters that are used to set-up destinations (i.e. DE format bit is 1). This action does not require a drive reset.	
59999	Deletes an onboard user program if a program is present. Note: Any parameter changes that have not been saved will be lost during this action.	No action if the drive is enabled. No action if there is no program present. No action if the user program is enabled (i.e. <i>Onboard User Program: Enable</i> (11.047) = 1)

Parameter mm.000 (mm.000) values from 1 to 14 are equivalent to other values as shown in the table below to allow easy access to some commonly used functions. For 0 and each of these values the keypad provides a string as shown.

Value	String	Equivalent value	Action
0	[No Action]	0	
1	[Save parameters]	1000	Save drive parameters to non-volatile memory
2	[Load file 1]	6001	Load the data from file 1 on a non-volatile media card into the drive provided it is a parameter file
3	[Save to file 1]	4001	Store the drive parameters in file 1 on a non-volatile media card
4	[Load file 2]	6002	Load the data from file 2 on a non-volatile media card into the drive provided it is a parameter file
5	[Save to file 2]	4002	Store the drive parameters in file 2 on a non-volatile media card
6	[Load file 3]	6003	Load the data from file 3 on a non-volatile media card into the drive provided it is a parameter file
7	[Save to file 3]	4003	Store the drive parameters in file 3 on a non-volatile media card
8	[Show non-default]	12000	Only display parameters that are different from their default value
9	[Destinations]	12001	Only display parameters that are used to set-up destinations
10	[Reset 50Hz defs]	1233	Load 50Hz defaults
11	[Reset 60Hz defs]	1244	Load 60Hz defaults
12	[Reset modules]	1070	Reset all option modules

Saving drive parameters

User-save and power-down save drive parameters are stored in non-volatile memory within the drive. Any values that have changed are copied to this memory under the following conditions.

Parameter type	Conditions for copy to non-volatile memory
User-save parameter not visible in menu 0	Drive reset with 1000 in <i>Parameter mm.000</i> (mm.000) if the drive is not in the under voltage state. OR A drive reset with 1001 in <i>Parameter mm.000</i> (mm.000). OR After parameters are transferred from a non-volatile media card. OR After the drive mode is changed. OR After default parameters are loaded. OR After parameters are transferred from an electronic nameplate.
User save parameter visible in menu 0	Under the conditions given above for user save parameters not visible in Menu 0. OR If the keypad is in edit mode for a user-save parameter in Menu 0, the parameter is saved when the keypad mode is changed from edit mode.
Power-down save parameter	A drive reset with 1000 in <i>Parameter mm.000</i> (mm.000) if the drive is not in the under voltage state. OR A drive reset with 1001 in <i>Parameter mm.000</i> (mm.000). OR On the transition into the under voltage state. OR After the drive mode is changed. OR After parameters are transferred from a non-volatile media card which results in the drive mode changing.

It can take some time for parameter data to be copied to non-volatile memory, especially if there are a large number of differences between the parameter values in the drive and the values stored in the memory. Saving Power-down save parameters takes a maximum of 300ms, but saving user-save parameters can take several seconds. If the drive is powered from a 24V control supply, or from a low voltage supply, the power down time of the control system can be very short and there is a risk that either the stored values of the power-down save or user-save parameters could be corrupted. This would result in an *EEPROM Fail* trip at the next power-up. To reduce this risk, the power-down save and user-save parameters are each stored in two banks. The banks are alternated each time a save is performed and the bank pointer is only updated once the save is complete. If the new bank is corrupted a *User Save* or *Power Down Save* is initiated at the next power-up indicating an error in the user-save or power-down save data respectively, and the data from the old bank is used. The following points should be noted:

1. If a *User Save* or *Power Down Save* trip occur at power-up then parameter changes made before power down will be lost. To clear these trips a parameter save must be performed. If both the user-save and power-down save data is corrupted then a *Power Down Save* trip is produced.
2. When a Menu 0 parameter is changed its value is saved immediately to the active bank and the bank pointer is not changed. Therefore changes made via Menu 0 are not lost if a *User Save* trip occurs at power-up.

3. When the drive mode changes all the data in both banks in the non-volatile memory is cleared and the default parameters are saved in both banks. Therefore there is an extended parameter saving period immediately after a drive mode change.
4. When a new option module is fitted to the drive all the data in both banks in the non-volatile memory is cleared. The next parameter a save time is extended as the new parameter data is written to both banks.
5. Two banks are not provided in non-volatile media cards therefore the card could be corrupted if the power is removed when the drive is writing data to the card.

Loading defaults

A drive reset with 1233 in *Parameter mm.000* (mm.000) loads the defaults defined for each parameter. If defaults are loaded with 1244 in *Parameter mm.000* (mm.000) then the parameters in the table below have different defaults that are intended for the 60Hz regions.

Parameter	Default	Drive modes	Drive voltage rating
<i>Maximum reference clamp</i> (01.006)	60.00Hz	All	All
<i>Standard Ramp Voltage</i> (02.008)	775V	All	400V
<i>Motor Rated Frequency</i> (05.006)	60.00Hz	All	All
<i>Motor Rated Load rpm</i> (05.008)	1800rpm	All	All
<i>Motor Rated Voltage</i> (05.009)	460V	All	400V
<i>M2 Maximum Reference Clamp</i> (21.001)	60.00Hz	All	All
<i>M2 Motor Rated Frequency</i> (21.006)	60.00Hz	All	All
<i>M2 Motor Rated Load rpm</i> (21.008)	1800rpm	All	All
<i>M2 Motor Rated Voltage</i> (21.009)	460V	All	All

Non-volatile media card data transfer

Details of the data that can be stored on a non-volatile media card and the methods to transfer/access this data are given in Menu 11.

Current Ratings

The tables below give the maximum output current ratings, peak current ratings and power ratings for all drive sizes and voltage ratings.

110V Rated Drives

Model	Heavy Duty					Normal Duty				Kc

Variable Minimums/Maximums

The descriptions below define the variable minimum/maximum pairs that can be used with parameters when the VM format bit is set. The variable minimum and maximum themselves can be dependent on other parameters, or the drive rating or other conditions as defined. The variable minimum and the variable maximum have a limited range and this is defined for each minimum/maximum pair.

Identifier	VM_AC_VOLTAGE
Description	Range applied to parameters showing a.c. voltage
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 930

VM_AC_VOLTAGE[MAX] in drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_AC_VOLTAGE[MAX]	325	650	780	930

VM_AC_VOLTAGE[MIN] = 0

Identifier	VM_AC_VOLTAGE_SET
Description	Range applied to a.c. voltage set-up parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 765

VM_AC_VOLTAGE_SET[MAX] is drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_AC_VOLTAGE_SET[MAX] frame size 1 to 4	240	480	N/A	N/A
VM_AC_VOLTAGE_SET[MAX] frame size 5 to 9	265	530	635	765

VM_AC_VOLTAGE_SET[MIN] = 0

Identifier	VM_ACCEL_RATE
Description	Maximum applied to the ramp rate parameters
Units	s/100Hz, s/1000Hz, s/MaxFrequency
Range of [MIN]	0.0
Range of [MAX]	0.0 to 3200.0

A maximum needs to be applied to the ramp rate parameters because the units are a time for a change of speed from zero to a defined level or to maximum speed. If the change of speed is to the maximum speed then changing the maximum speed changes the actual ramp rate for a given ramp rate parameter value. The variable maximum calculation ensures that longest ramp rate (parameter at its maximum value) is not slower than the rate with the defined level, i.e. 3200.0 s/100Hz.

The maximum frequency is taken from *Maximum Reference Clamp* (01.006) if *Select Motor 2 Parameters* (11.045) = 0, or *M2 Maximum Reference Clamp* (21.001) if *Select Motor 2 Parameters* (11.045) = 1.

VM_ACCEL_RATE[MIN] = 0.0

If *Ramp Rate Units* (02.039) = 0:

VM_ACCEL_RATE[MAX] = 3200.0

Otherwise:

VM_ACCEL_RATE[MAX] = 3200.0 x Maximum frequency / 100.00

Identifier	VM_DC_VOLTAGE
Description	Range applied to d.c. voltage reference parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 1190

VM_DC_VOLTAGE[MAX] is the full scale d.c. link voltage feedback (over voltage trip level) for the drive. This level is drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_DC_VOLTAGE[MAX] frame size 1 to 4	510	870	N/A	N/A
VM_DC_VOLTAGE[MAX] frame size 5 to 9	415	830	990	1190

VM_DC_VOLTAGE[MIN] = 0

Identifier	VM_DC_VOLTAGE_SET
Description	Range applied to d.c. voltage reference parameters
Units	V
Range of [MIN]	0
Range of [MAX]	0 to 1150

VM_DC_VOLTAGE_SET[MAX] is drive voltage rating dependent. All values are shown in the table below.

Voltage level	200V	400V	575V	690V
VM_DC_VOLTAGE_SET[MAX]	400	800	955	1150

VM_DC_VOLTAGE_SET[MIN] = 0

Identifier	VM_DRIVE_CURRENT
Description	Range applied to parameters showing current in A
Units	A
Range of [MIN]	-9999.99 to 0.00
Range of [MAX]	0.00 to 9999.99

VM_DRIVE_CURRENT[MAX] is equivalent to the full scale (over current trip level) for the drive and is given by *Full Scale Current Kc* (11.061).

VM_DRIVE_CURRENT[MIN] = - VM_DRIVE_CURRENT[MAX]

Identifier	VM_FREQ
Description	Range applied to parameters showing frequency
Units	Hz
Range of [MIN]	-1100.00
Range of [MAX]	1100.00

This variable minimum/maximum defines the range of speed monitoring parameters. To allow headroom for overshoot the range is set to twice the range of the speed references.

VM_FREQ[MIN] = 2 x VM_SPEED_FREQ_REF[MIN]

VM_FREQ[MAX] = 2 x VM_SPEED_FREQ_REF[MAX]

Identifier	VM_MAX_SWITCHING_FREQUENCY
Description	Range applied to the maximum switching frequency parameters
Units	User units
Range of [MIN]	OpenLoop: 0 (0.667kHz), RFC-A: 2 (2kHz)
Range of [MAX]	8 (16kHz)

VM_SWITCHING_FREQUENCY[MAX] = Power stage dependent

VM_SWITCHING_FREQUENCY[MIN] = 0

Identifier	VM_MOTOR1_CURRENT_LIMIT
Description	Range applied to current limit parameters (motor 1)
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0

VM_MOTOR1_CURRENT_LIMIT[MAX] is dependent on the drive rating and motor set-up parameters.

VM_MOTOR1_CURRENT_LIMIT[MIN] = 0.0

Identifier	VM_MOTOR2_CURRENT_LIMIT
Description	Range applied to current limit parameters (motor 2)
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0

VM_MOTOR2_CURRENT_LIMIT[MAX] is dependent on the drive rating and motor set-up parameters.

VM_MOTOR2_CURRENT_LIMIT[MIN] = 0.0

Identifier	VM_NEGATIVE_REF_CLAMP1
Description	Limits applied to the negative frequency clamp (motor 1)
Units	Hz
Range of [MIN]	-550.00 to 0.00
Range of [MAX]	0.00 to 550.00

This variable maximum/minimum defines the range of the negative frequency clamp associated with motor map 1 (*Minimum Reference Clamp* (01.007)). The minimum and maximum are affected by the settings of the *Negative Reference Clamp Enable* (01.008), *Bipolar Reference Enable* (01.010) and *Maximum Reference Clamp* (01.006) as shown in the table below.

<i>Negative Reference Clamp Enable</i> (01.008)	<i>Bipolar Reference Enable</i> (01.010)	VM_NEGATIVE_REF_CLAMP1[MIN]	VM_NEGATIVE_REF_CLAMP1[MAX]
0	0	0.00	Pr 01.006
0	1	0.00	0.00
1	X	-VM_POSITIVE_REF_CLAMP[MAX]	0.00

Identifier	VM_NEGATIVE_REF_CLAMP2
Description	Limits applied to the negative frequency clamp (motor 2)
Units	Hz
Range of [MIN]	-550.00 to 0.00
Range of [MAX]	0.00 to 550.00

This variable maximum/minimum defines the range of the negative frequency clamp associated with motor map 2 (*M2 Minimum Reference Clamp* (21.002)). It is defined in the same way as VM_NEGATIVE_REF_CLAMP1 except that the *M2 Maximum Reference Clamp* (21.001) is used instead of *Maximum Reference Clamp* (01.006).

Identifier	VM_POSITIVE_REF_CLAMP
Description	Limits applied to the positive frequency reference clamp
Units	Hz
Range of [MIN]	0.00
Range of [MAX]	550.00

VM_POSITIVE_REF_CLAMP[MAX] defines the range of the positive reference clamp, *Maximum Reference Clamp* (01.006), which in turn limit the references.

Identifier	VM_POWER
Description	Range applied to parameters that either set or display power
Units	kW
Range of [MIN]	-9999.99 to 0.00
Range of [MAX]	0.00 to 9999.99

VM_POWER[MAX] is rating dependent and is chosen to allow for the maximum power that can be output by the drive with maximum a.c. output voltage, at maximum controlled current and unity power factor.

$$VM_POWER[MAX] = \sqrt{3} \times VM_AC_VOLTAGE[MAX] \times VM_DRIVE_CURRENT[MAX] / 1000$$

$$VM_POWER[MIN] = -VM_POWER[MAX]$$

Identifier	VM_RATED_CURRENT
Description	Range applied to rated current parameters
Units	A
Range of [MIN]	0.00
Range of [MAX]	0.00 to 9999.99

VM_RATED_CURRENT [MAX] = *Maximum Rated Current* (11.060) and is dependent on the drive rating.

$$VM_RATED_CURRENT [MIN] = 0.00$$

Identifier	VM_SPEED_FREQ_REF
Description	Range applied to the frequency reference parameters
Units	Hz
Range of [MIN]	-550.00 to 0.00
Range of [MAX]	0.00 to 550.00

This variable minimum/maximum is applied throughout the frequency and speed reference system so that the references can vary in the range from the minimum to maximum clamps.

Negative Reference Clamp Enable (01.008)	VM_SPEED_FREQ_REF[MAX] if Select Motor 2 Parameters (11.045) = 0	VM_SPEED_FREQ_REF[MAX] if Select Motor 2 Parameters (11.045) = 1
0	Maximum Reference Clamp (01.006)	M2 Maximum Reference Clamp (21.001)
1	Maximum Reference Clamp (01.006) or Minimum Reference Clamp (01.007) whichever the larger	M2 Maximum Reference Clamp (21.001) or M2 Minimum Reference Clamp (21.002) whichever the larger

VM_SPEED_FREQ_REF[MIN] = -VM_SPEED_FREQ_REF[MAX].

Identifier	VM_SPEED_FREQ_REF_UNIPOLAR
Description	Unipolar version of VM_SPEED_FREQ_REF
Units	Hz
Range of [MIN]	0.00
Range of [MAX]	0.00 to 550.00

VM_SPEED_FREQ_REF_UNIPOLAR[MAX] = VM_SPEED_FREQ_REF[MAX]

VM_SPEED_FREQ_REF_UNIPOLAR[MIN] = 0.00

Identifier	VM_SPEED_FREQ_USER_REFS
Description	Range applied to analogue reference parameters
Units	Hz
Range of [MIN]	-550.00 to 550.00
Range of [MAX]	0.00 to 550.00

This variable maximum is applied to *Analogue Reference 1* (01.036), *Analogue Reference 2* (01.037) and *Keypad Reference* (01.017).

The maximum applied to these parameters is the same as other frequency reference parameters.

VM_SPEED_FREQ_USER_REFS [MAX] = VM_SPEED_FREQ_REF[MAX]

However the minimum is dependent on *Negative Reference Clamp Enable* (01.008) and *Bipolar Reference Enable* (01.010).

Negative Reference Clamp Enable (01.008)	Bipolar Reference Enable (01.010)	VM_SPEED_FREQ_USER_REFS[MIN]
0	0	If Select Motor 2 Parameters (11.045) = 0 Minimum Reference Clamp (01.007), otherwise M2 Minimum Reference Clamp (21.002)
0	1	-VM_SPEED_FREQ_REF[MAX]
1	0	0.00
1	1	-VM_SPEED_FREQ_REF[MAX]

Identifier	VM_SUPPLY_LOSS_LEVEL
Description	Range applied to the supply loss threshold
Units	V
Range of [MIN]	0 to 1150
Range of [MAX]	0 to 1150

VM_SUPPLY_LOSS_LEVEL[MAX] = VM_DC_VOLTAGE_SET[MAX]

VM_SUPPLY_LOSS_LEVEL[MIN] is drive voltage rating dependent. See the table below.

Voltage level	200V	400V	575V	690V
VM_SUPPLY_LOSS_LEVEL[MIN]	205	410	540	540

Identifier	VM_TORQUE_CURRENT
Description	Range applied to torque and torque producing current parameters.
Units	%
Range of [MIN]	-1000.0 to 0.0
Range of [MAX]	0.0 to 1000.0

Select Motor 2 Parameters (11.045)	VM_TORQUE_CURRENT[MAX]
0	VM_MOTOR1_CURRENT_LIMIT[MAX]
1	VM_MOTOR2_CURRENT_LIMIT[MAX]

VM_TORQUE_CURRENT[MIN] = -VM_TORQUE_CURRENT[MAX]

Identifier	VM_TORQUE_CURRENT_UNIPOLAR
Description	Unipolar version of VM_TORQUE_CURRENT
Units	%
Range of [MIN]	0.0
Range of [MAX]	0.0 to 1000.0

VM_TORQUE_CURRENT_UNIPOLAR[MAX] = VM_TORQUE_CURRENT[MAX]

VM_TORQUE_CURRENT_UNIPOLAR[MIN] = 0.0

Identifier	VM_USER_CURRENT
Description	Range applied to torque reference and percentage load parameters with one decimal place
Units	%
Range of [MIN]	-1000.0 to 0.0
Range of [MAX]	0.0 to 1000.0

VM_USER_CURRENT[MAX] = *User Current Maximum Scaling* (04.024)

VM_USER_CURRENT[MIN] = -VM_USER_CURRENT[MAX]

Menu 1 Single Line Descriptions – Frequency References

Mode: RFC-A

Parameter		Range	Default	Type					
01.001	Reference Selected	±VM_SPEED_FREQ_REF Hz		RO	Num	ND	NC	PT

Menu 1 – Frequency References

Mode: RFC-A

References

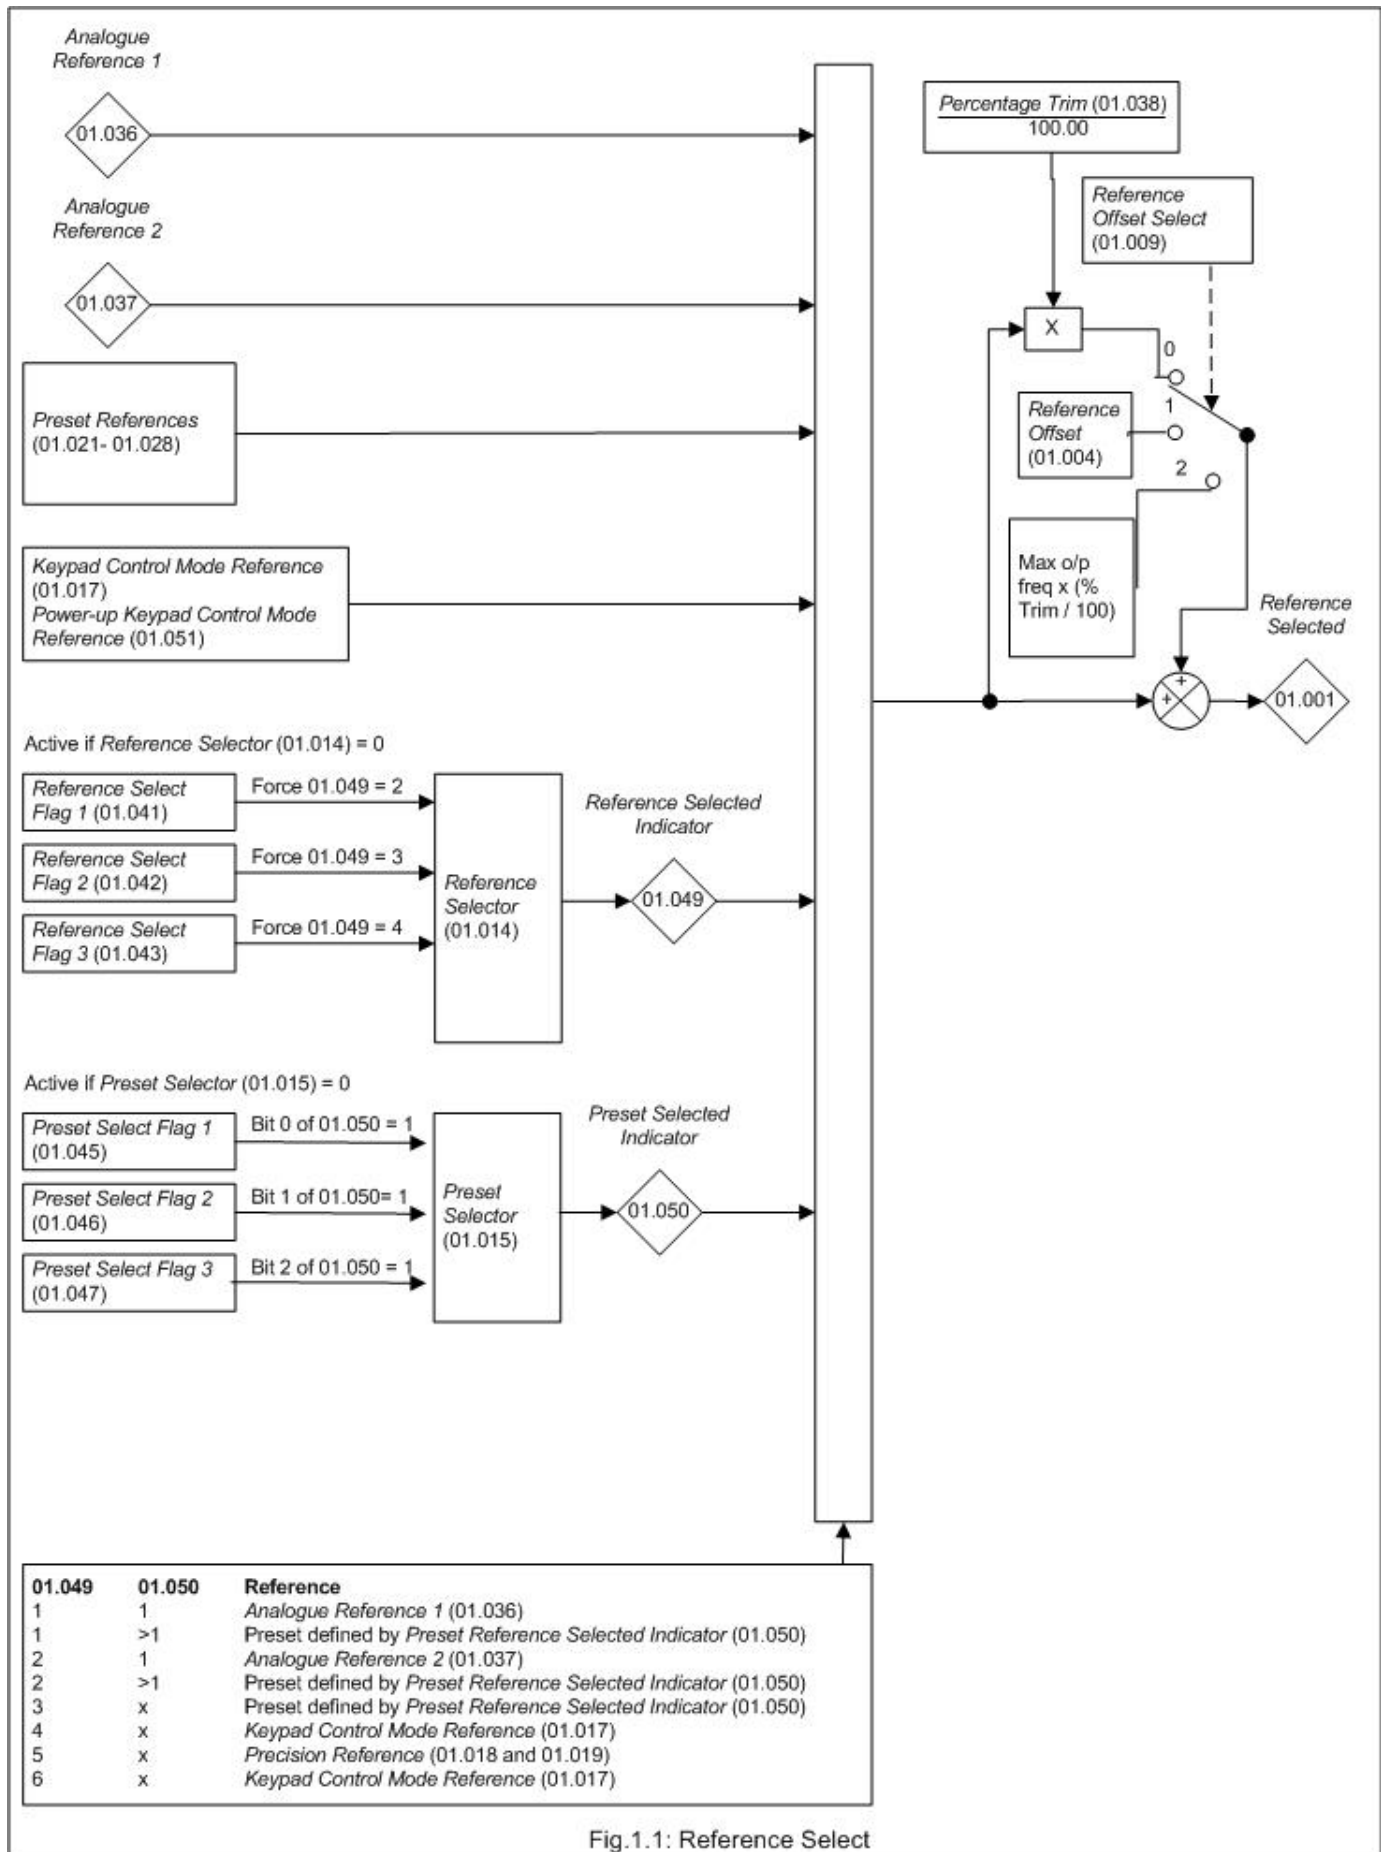

Fig.1.1: Reference Select

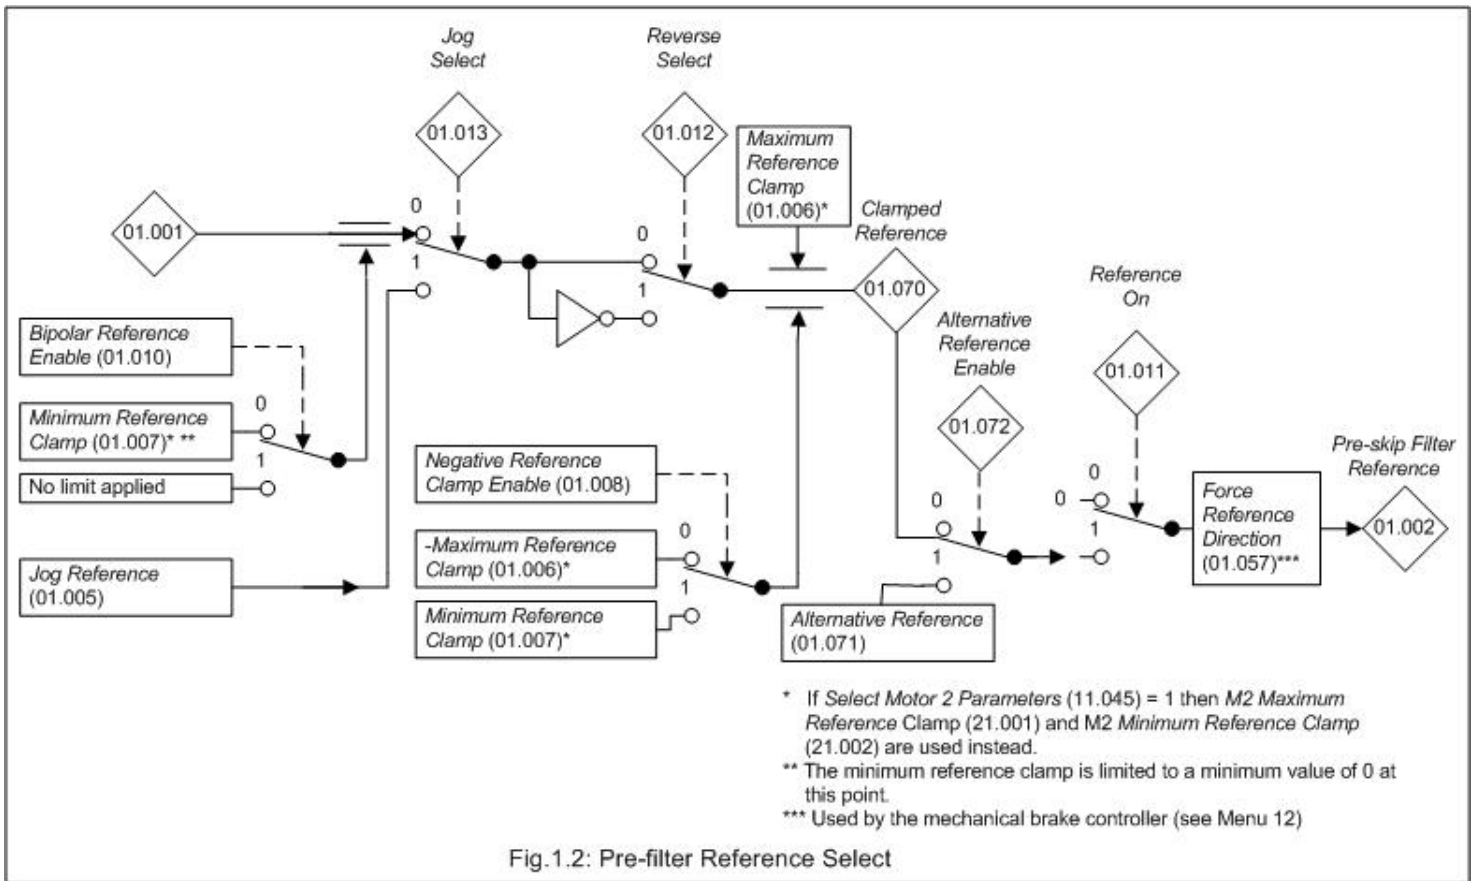

Fig.1.2: Pre-filter Reference Select

The Clamped Reference is provided as a source for the PID control contained in menu 14. The Alternative Reference is provided as a destination for the output from the PID.

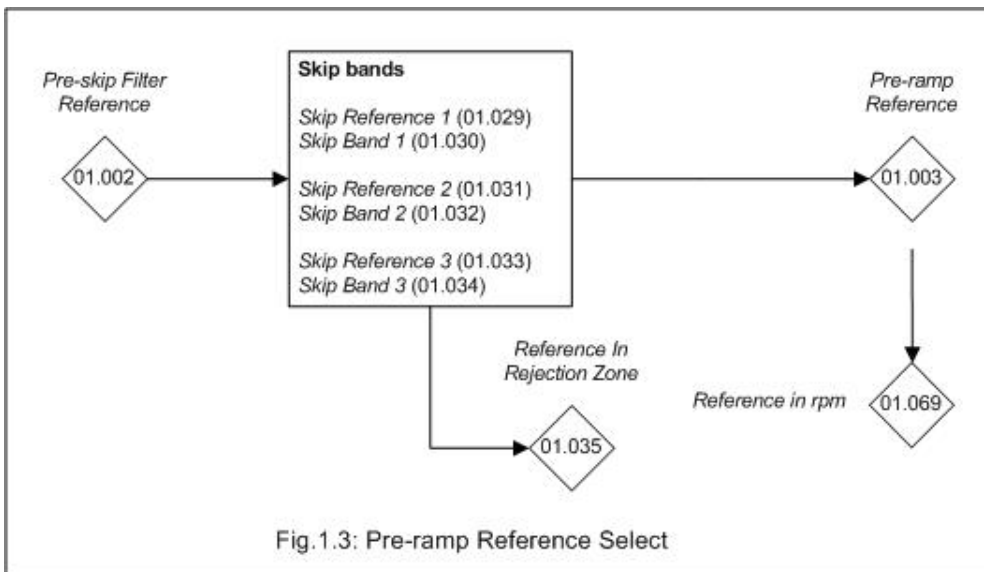

Fig.1.3: Pre-ramp Reference Select

Parameter	01.001 Reference Selected			
Short description	Displays the basic reference selected from the available sources			
Mode	RFC-A			
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF	
Default	Units		Hz	
Type	32 Bit Volatile		Update Rate	4ms write
Display Format	Standard		Decimal Places	2
Coding	RO, VM, ND, NC, PT			

Reference Selected (01.001) is the basic reference selected from the available sources including the effect of the reference offset. See Fig.1.1.

Parameter	01.002 Pre-skip Filter Reference		
Short description	Displays the level of the reference after the reference clamps		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, VM, ND, NC, PT		

Parameter	01.003 Pre-ramp Reference		
Short description	Displays the final output from the reference system		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, VM, ND, NC, PT		

Fig.1.3 shows the process from the *Pre-skip Filter Reference* (01.002) to the *Pre-ramp Reference* (01.003). The *Pre-ramp Reference* (01.003) is the final output from the Menu 01 reference system that is fed into the Menu 02 ramp system.

Parameter	01.004 Reference Offset		
Short description	Defines the the offset applied to the reference		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

If *Reference Offset Select* (01.009) = 0 then *Reference Selected* (01.001) is the selected reference multiplied by $[1 + \text{Percentage Trim (01.038)} / 100.00]$.

If *Reference Offset Select* (01.009) = 1 then the *Reference Offset* (01.004) is added to the selected reference to give *Reference Selected* (01.001).

If *Reference Offset Select* (01.009) = 2 then *Reference Selected* (01.001) is the selected reference plus the maximum output frequency multiplied by $(\text{Percentage Trim (01.038)} / 100.00)$.

Parameter	01.005 Jog Reference		
Short description	Defines the reference when jog is enabled		
Mode	RFC-A		
Minimum	0.00	Maximum	300.00
Default	1.50	Units	Hz
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

Parameter	01.006 Maximum Reference Clamp		
Short description	Defines the maximum value for the reference		
Mode	RFC-A		
Minimum	-VM_POSITIVE_REF_CLAMP	Maximum	VM_POSITIVE_REF_CLAMP
Default	See exceptions below	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

Region	Default Value
50Hz	50.00
60Hz	60.00

Maximum Reference Clamp (01.006) provides a limit on the maximum frequency. (If *Select Motor 2 Parameters* (11.045) = 1 then *M2 Maximum Reference Clamp* (21.001) is used instead.)

Parameter	01.007 Minimum Reference Clamp		
Short description	Defines the minimum value for the reference		
Mode	RFC-A		
Minimum	-VM_NEGATIVE_REF_CLAMP1	Maximum	VM_NEGATIVE_REF_CLAMP1
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

If *Negative Reference Clamp Enable* (01.008) = 1 then *Minimum Reference Clamp* (01.007) is forced to be a negative value and is applied to the final reference as the negative limit. If *Negative Reference Clamp Enable* (01.008) = 0 then - *Maximum Reference Clamp* (01.006) is applied to the final reference as the negative limit. (If *Select Motor 2 Parameters* (11.045) = 1 then *M2 Minimum Reference Clamp* (21.002) is used instead.)

The minimum reference clamp is also used to provide the minimum frequency limit for uni-polar mode (i.e. *Bipolar Reference Enable* (01.010) = 0) after the *Reference Selected* (01.001) as shown in Fig.1.2.

Parameter	01.008 <i>Negative Reference Clamp Enable</i>		
Short description	Set to 1 to allow the minimum reference clamp value to be negative		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Minimum Reference Clamp* (01.007).

Parameter	01.009 <i>Reference Offset Select</i>		
Short description	Enables the use of the reference offset		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Reference Offset* (01.004).

Parameter	01.010 <i>Bipolar Reference Enable</i>		
Short description	Enables the minimum value of the reference to be negative		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Minimum Reference Clamp* (01.007).

Parameter	01.011 <i>Reference On</i>		
Short description	Indicates that the reference from the reference system is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Reference On (01.011), which is controlled by the drive sequencer (see Menu 06) indicates that the reference from the reference system is active. Note that *Reference On* (01.011) is also used in RFC-A and RFC-S modes to enable and disable the *Hard Frequency Reference* (03.022).

Parameter	01.012 <i>Reverse Select</i>		
Short description	Indicates when the reverse function is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Reverse Select (01.012), which is controlled by the drive sequencer (see Menu 06), is used to invert *Reference Selected* (01.001) or the *Jog Reference* (01.005).

Parameter	01.013 <i>Jog Select</i>		
Short description	Indicates when the jog function is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	2ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Jog Select (01.013) which is controlled by the drive sequencer (see Menu 06), is used to select the *Jog Reference* (01.005).

Parameter	01.014 Reference Selector		
Short description	Defines the source for the reference		
Mode	RFC-A		
Minimum	0	Maximum	6
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	A1 A2	Analogue reference 1 or 2 selected by terminal input
1	A1 Preset	Analogue reference 1 or Presets selected by terminal input
2	A2 Preset	Analogue reference 2 or Presets selected by terminal input
3	Preset	Preset reference selected by terminal
4	Keypad	Keypad reference selected
5	Reserved	Reserved
6	Keypad Ref	Keypad reference selected but no control mode

See *Control Word Enable* (06.043) which will take priority over *Reference Selector* (01.014).

If *Drive Configuration* (11.034) is set to 8 then *Reference Selector* (01.014) is automatically set to 4.

Reference Selector (01.014) defines how *Reference Selected Indicator* (01.049) is derived. If 0 *Reference Selector* (01.014) *Reference Selected Indicator* (01.049) is equal to *Reference Selector* (01.014). If *Reference Selector* (01.014) = 0 then *Reference Selected Indicator* (01.049) is controlled by the reference select flags as shown below. The higher numbered flags have priority over the lower numbered flags.

Reference select flag states	Reference Selected Indicator (01.049)
All reference select flags equal to 0	1
Reference Select Flag 1 (01.041) = 1	2
Reference Select Flag 2 (01.042) = 1	3
Reference Select Flag 3 (01.043) = 1	4

Preset Selector (01.015) defines how *Preset Selected Indicator* (01.050) is derived as shown below.

Preset Selector (01.015)	Preset Selected Indicator (01.050)
0	Controlled by the preset select flags (01.045 to 01.047)
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	8
9	Controlled by the present reference selector timer (see <i>Preset Selector Timer</i> (01.016))

When *Preset Selector* (01.015) = 0 then *Preset Selected Indicator* (01.050) is defined by the preset select flags as shown below.

Preset Select Flag 3 (01.047)	Preset Select Flag 2 (01.046)	Preset Select Flag 1 (01.045)	Preset Selected Indicator (01.050)
0	0	0	1
0	0	1	2
0	1	0	3
0	1	1	4
1	0	0	5
1	0	1	6
1	1	0	7
1	1	1	8

Reference Selected Indicator (01.049) and *Preset Selected Indicator* (01.050) then define the reference to be used as shown below.

Reference Selected Indicator (01.049)	Preset Selected Indicator (01.050)	Reference
1	1	Analog Reference 1 (01.036)
1	>1	Preset reference defined by the value of Preset Selected Indicator (01.050)
2	1	Analog Reference 2 (01.037)
2	>1	Preset reference defined by the value of Preset Selected Indicator (01.050)
3	x	Preset reference defined by the value of Preset Selected Indicator (01.050)
4	x	Keypad Control Mode Reference (01.017)
5	x	Not used
6	x	Keypad Control Mode Reference (01.017)

If Reference Selected Indicator (01.049) = 4 the Keypad Control Mode Reference (01.017) is used and the sequencer operates in keypad mode where the start and stop functions are provided from the drive keypad. Jog Select (01.013) is always 0 when keypad mode is active.

If Reference Selected Indicator (01.049) = 6 the Keypad Control Mode Reference (01.017) is used, but keypad control mode is not active.

Parameter	01.015 Preset Selector		
Short description	Defines which preset is used for the reference		
Mode	RFC-A		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	01.016 Preset Selector Timer		
Short description	Defines the time between changes of preset selector		
Mode	RFC-A		
Minimum	0.0	Maximum	400.0
Default	10.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

If Preset Selector (01.015) = 9 then Preset Selected Indicator (01.050) is incremented by one at intervals defined by Preset Selector Timer (01.016). When Preset Selected Indicator (01.050) has a value of 8 and is incremented it rolls over to 1. If Preset Selector Timer Reset (01.048) = 1 and Preset Selector (01.015) = 9, then Preset Selected Indicator (01.050) is held at 1.

Parameter	01.017 Keypad Control Mode Reference		
Short description	Displays the value of the keypad reference		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_USER_REFS	Maximum	VM_SPEED_FREQ_USER_REFS
Default	0.00	Units	Hz
Type	32 Bit Power Down Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RO, VM, NC, PT		

See Reference Selector (01.014) for selection of the Keypad Control Mode Reference (01.017).

Parameter	01.021 Preset Reference 1		
Short description	Defines the value for preset reference 1		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.022 Preset Reference 2		
Short description	Defines the value for preset reference 2		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See Reference Selector (01.014).

Parameter	01.023 Preset Reference 3		
Short description	Defines the value for preset reference 3		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.024 Preset Reference 4		
Short description	Defines the value for preset reference 4		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.025 Preset Reference 5		
Short description	Defines the value for preset reference 5		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.026 Preset Reference 6		
Short description	Defines the value for preset reference 6		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.027 Preset Reference 7		
Short description	Defines the value for preset reference 7		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.028 Preset Reference 8		
Short description	Defines the value for preset reference 8		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

See *Reference Selector* (01.014).

Parameter	01.029 Skip Reference 1		
Short description	Defines the 1st reference point to skip		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

The skip references functions are available to prevent continuous operation within a specified frequency range (i.e. where mechanical resonance may occur). When *Skip Reference 1* (01.029) = 0 Filter 1 is disabled. *Skip Reference Band 1* (01.030) defines the range either side of *Skip Reference 1* (01.029) over which references are rejected in either direction. The actual rejection band is therefore twice that defined by *Skip Reference Band 1* (01.030) with *Skip Reference 1* (01.029) as the centre of the band. When the selected reference is within the rejection band the lower limit of the band is passed through the filter so that reference is always less than demanded.

Filter 2 (*Skip Reference 2* (01.031), *Skip Reference Band 2* (01.032)) and Filter 3 (*Skip Reference 3* (01.033), *Skip Reference Band 3* (01.034)) operate in the same ways as Filter 1.

If any of the filters are active (i.e. the reference is within their rejection band) *Reference In Rejection Zone* (01.035) is set to 1, otherwise it is 0.

Parameter	01.030 Skip Reference Band 1		
Short description	Defines the range either side of skip reference 1 to be implemented		
Mode	RFC-A		
Minimum	0.00	Maximum	25.00
Default	0.50	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

See *Skip Reference 1* (01.029).

Parameter	01.031 Skip Reference 2		
Short description	Defines the 2nd reference point to skip		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Skip Reference 1* (01.029).

Parameter	01.032 Skip Reference Band 2		
Short description	Defines the range either side of skip reference 2 to be implemented		
Mode	RFC-A		
Minimum	0.00	Maximum	25.00
Default	0.50	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

See *Skip Reference 1* (01.029).

Parameter	01.033 Skip Reference 3		
Short description	Defines the 3rd reference point to skip		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Skip Reference 1* (01.029).

Parameter	01.034 Skip Reference Band 3		
Short description	Defines the range either side of skip reference 3 to be implemented		
Mode	RFC-A		
Minimum	0.00	Maximum	25.00
Default	0.50	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

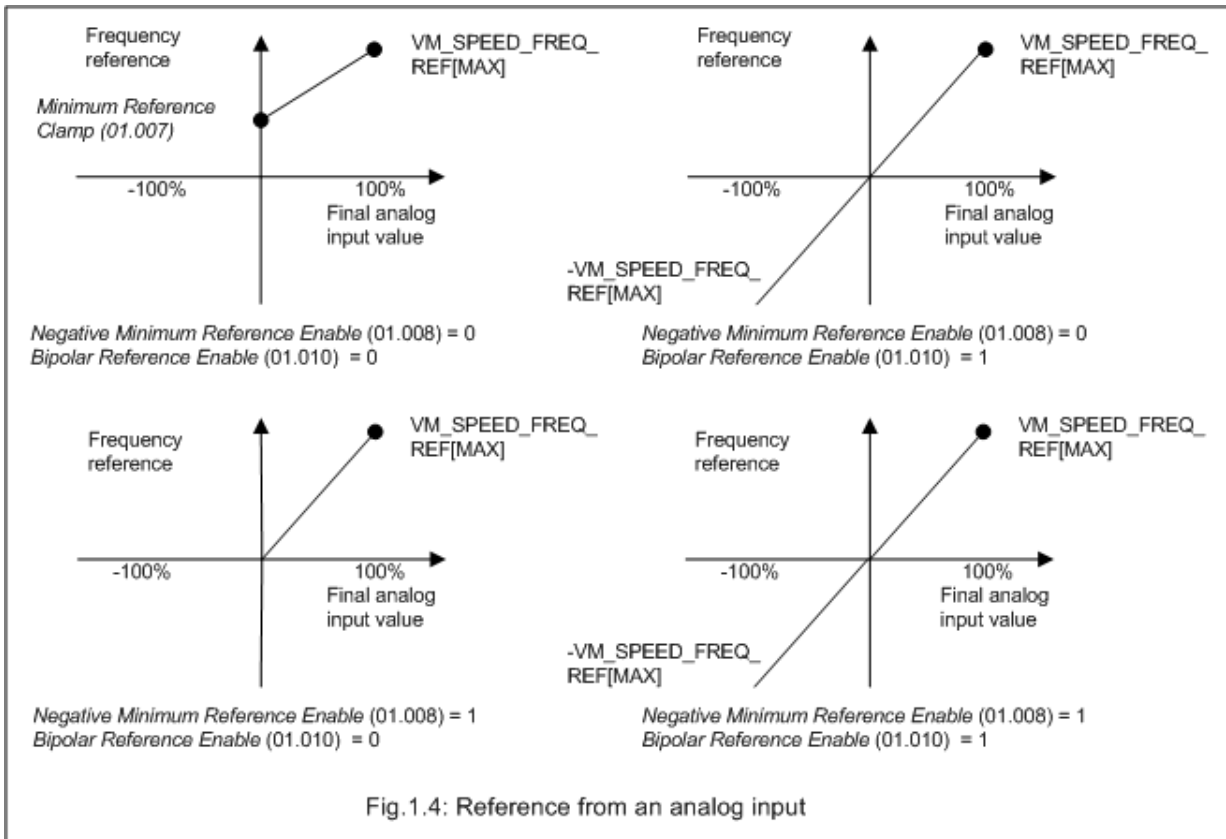

See *Skip Reference 1* (01.029).

Parameter	01.035 Reference In Rejection Zone		
Short description	Displays when the reference is in 1 of the pre-defined rejection zones		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Skip Reference 1* (01.029).

Parameter	01.036 Analog Reference 1		
Short description	Defines the relationship between the final value from analog 1 input and the frequency or speed reference		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_USER_REFS	Maximum	VM_SPEED_FREQ_USER_REFS
Default	0.00	Units	Hz
Type	32 Bit Volatile	Update Rate	1ms read
Display Format	Standard	Decimal Places	2
Coding	RO, VM, NC		

Analog Reference 1 (01.036) or *Analog Reference 2* (01.037) should be used as the destinations for drive analog inputs when these provide the frequency reference. The variable maximum/minimum applied to *Analog Reference 1* (01.036) or *Analog Reference 2* (01.037) gives the relationship shown below between the final value from the analog input and the frequency reference.

Parameter	01.037 Analog Reference 2		
Short description	Defines the relationship between the final value from analog input 2 and the frequency or speed reference		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_USER_REFS	Maximum	VM_SPEED_FREQ_USER_REFS
Default	0.00	Units	Hz
Type	32 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RO, VM, NC		

See *Analog Reference 1* (01.036).

Parameter	01.038 Percentage Trim		
Short description	Defines the value of the reference trim as a percentage		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, NC		

See *Reference Offset Select* (01.009).

Parameter	01.041 Reference Select Flag 1		
Short description	Defines which reference is selected by the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Reference Selector* (01.014).

Parameter	01.042 Reference Select Flag 2		
Short description	Defines which reference is selected by the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Reference Selector* (01.014).

Parameter	01.043 Reference Select Flag 3		
Short description	Defines which reference is selected by the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Reference Selector* (01.014).

Parameter	01.045 Preset Select Flag 1		
Short description	Defines which preset is selected by the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Reference Selector* (01.014).

Parameter	01.046 Preset Select Flag 2		
Short description	Defines which preset is selected by the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Reference Selector* (01.014).

Parameter	01.047 Preset Select Flag 3		
Short description	Defines which preset is selected by the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See Reference Selector (01.014).

Parameter	01.048 Preset Selector Timer Reset		
Short description	Set to 1 to hold the preset selected indicator at 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See Preset Selector Timer (01.016).

Parameter	01.049 Reference Selected Indicator		
Short description	Displays which reference is currently selected		
Mode	RFC-A		
Minimum	1	Maximum	6
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See Reference Selector (01.014).

Parameter	01.050 Preset Selected Indicator		
Short description	Displays which preset is currently selected		
Mode	RFC-A		
Minimum	1	Maximum	8
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See Reference Selector (01.014).

Parameter	01.051 Power-up Keypad Control Mode Reference		
Short description	Defines which value of keypad control mode reference is displayed at power-up		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Power-up read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Reset	Keypad reference is zero
1	Last	Keypad reference is the last used value
2	Preset	Keypad reference is copied from Preset speed 1 (01.21)

Power-up Keypad Control Mode Reference (01.051) defines the value written to Keypad Control Mode Reference (01.017) at power-up as given below.

Power-up Keypad Control Mode Reference (01.051)	Value written to Keypad Control Mode Reference (01.017) at power-up
0	0.0
1	The value in Keypad Control Mode Reference (01.017) at the previous power-down
2	The value saved in Preset Reference 1 (01.021)

Parameter	01.057 Force Reference Direction		
Short description	Defines the direction of the reference		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	Forward
2	Reverse

If *Force Reference Direction* (01.057) = 0 then it has no effect. If *Force Reference Direction* (01.057) is non-zero then the modulus of the reference is used and the sign is defined by the value of *Force Reference Direction* (01.057). If *Force Reference Direction* (01.057) = 1 then *Pre-skip Filter Reference* (01.002) is always positive, and if *Force Reference Direction* (01.057) = 2 then *Pre-skip Filter Reference* (01.002) is always zero or negative.

Parameter	01.069 Reference in rpm		
Short description	Displays the value of the reference in rpm		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	rpm
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, VM, ND, NC, PT		

Uses the set number of poles.

Parameter	01.070 Clamped Reference		
Short description	Displays the reference that is provided for the PID controller		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, VM, ND, NC, PT		

The *Clamped Reference* (01.070) is provided as a source for the PID control in menu 14.

Parameter	01.071 Alternative Reference		
Short description	Defines the reference which is used as a destination for the output of the PID controller		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RO, VM, NC		

Alternative Reference (01.071) defines the routing parameter used for the source reference.

If the routing parameter is valid the *Alternative Reference Enable* (01.072) is set to 1.

Parameter	01.072 Alternative Reference Enable		
Short description	Indicates when the Alternative Reference is being used		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Alternative Reference* (01.071).

Menu 2 Single Line Descriptions – Frequency Ramps

Menu 2 – Frequency Ramps

Mode: RFC-A

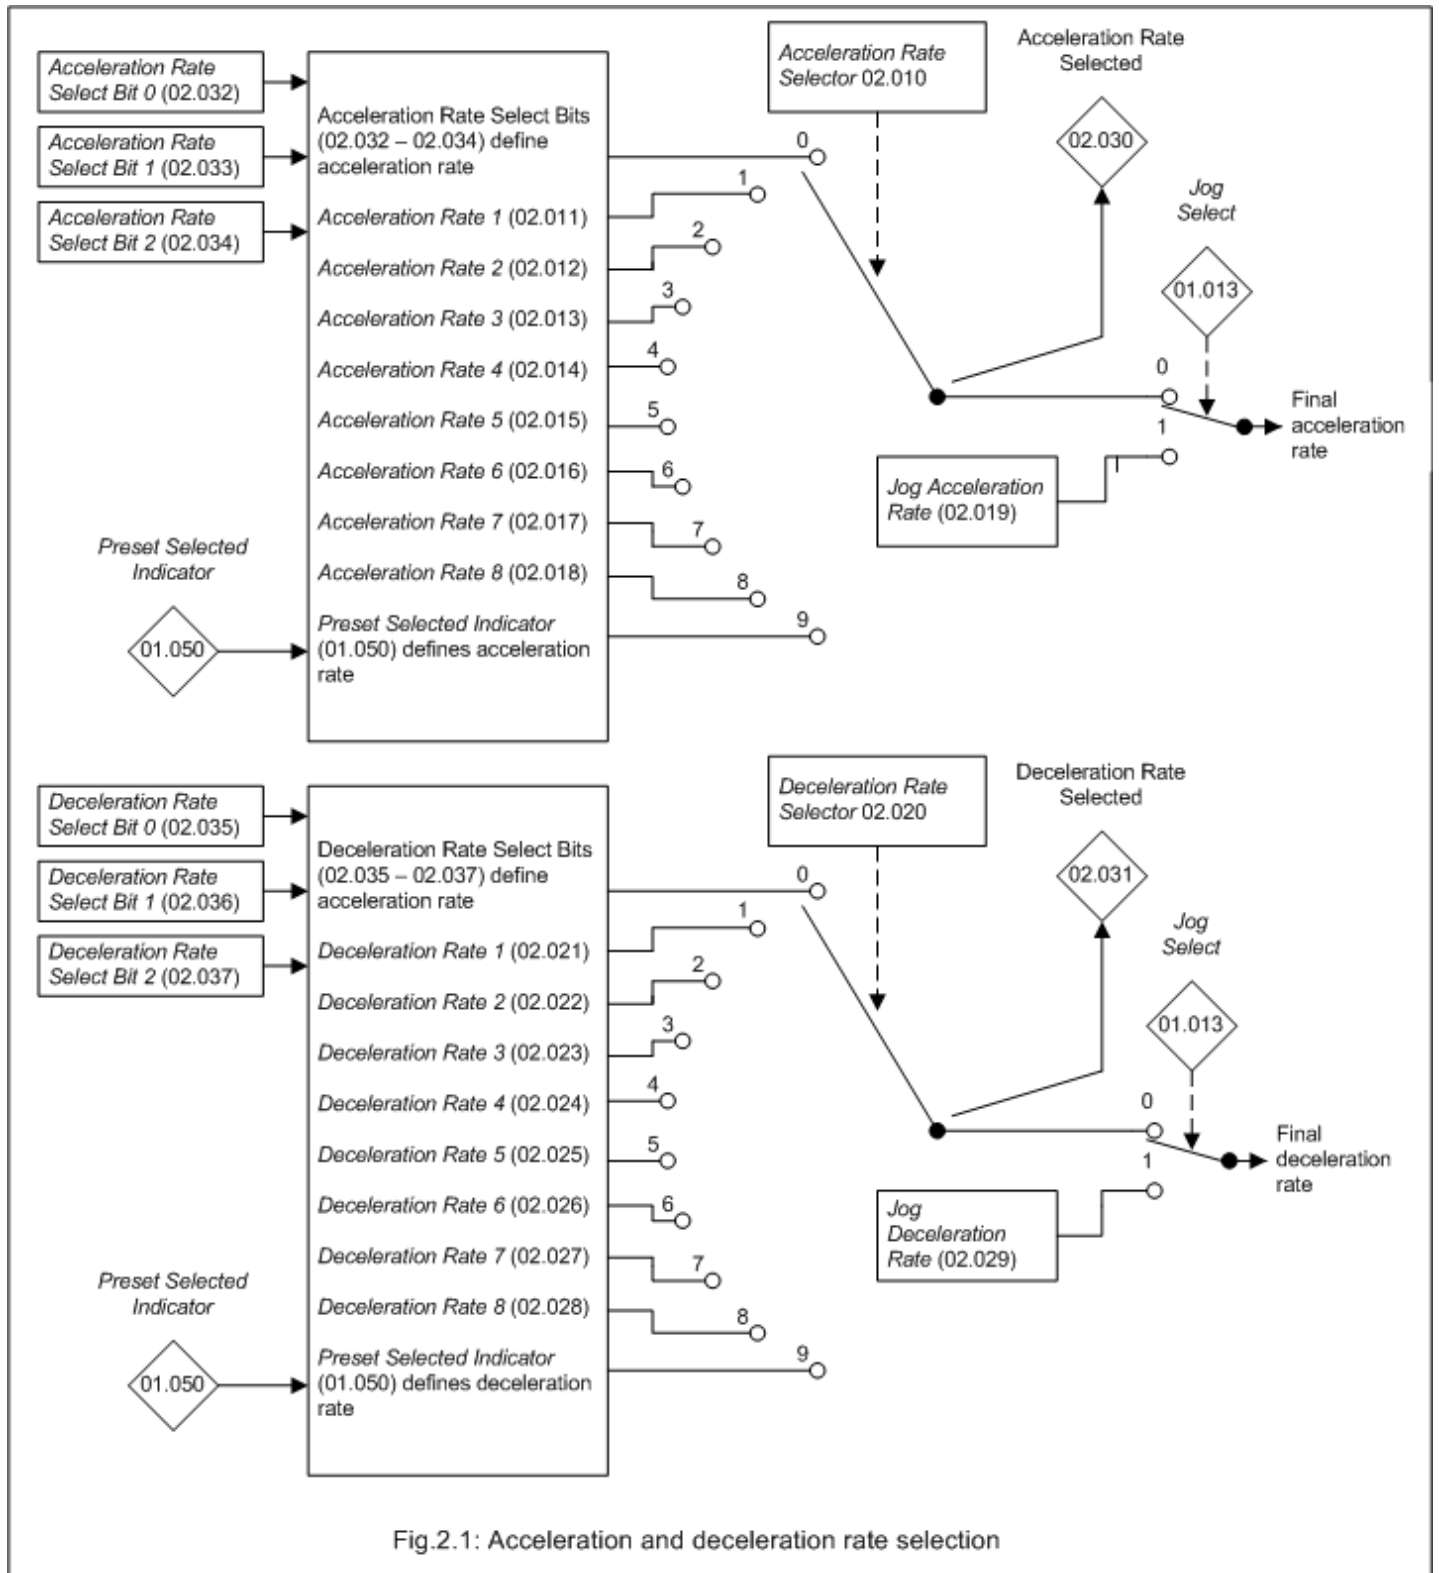

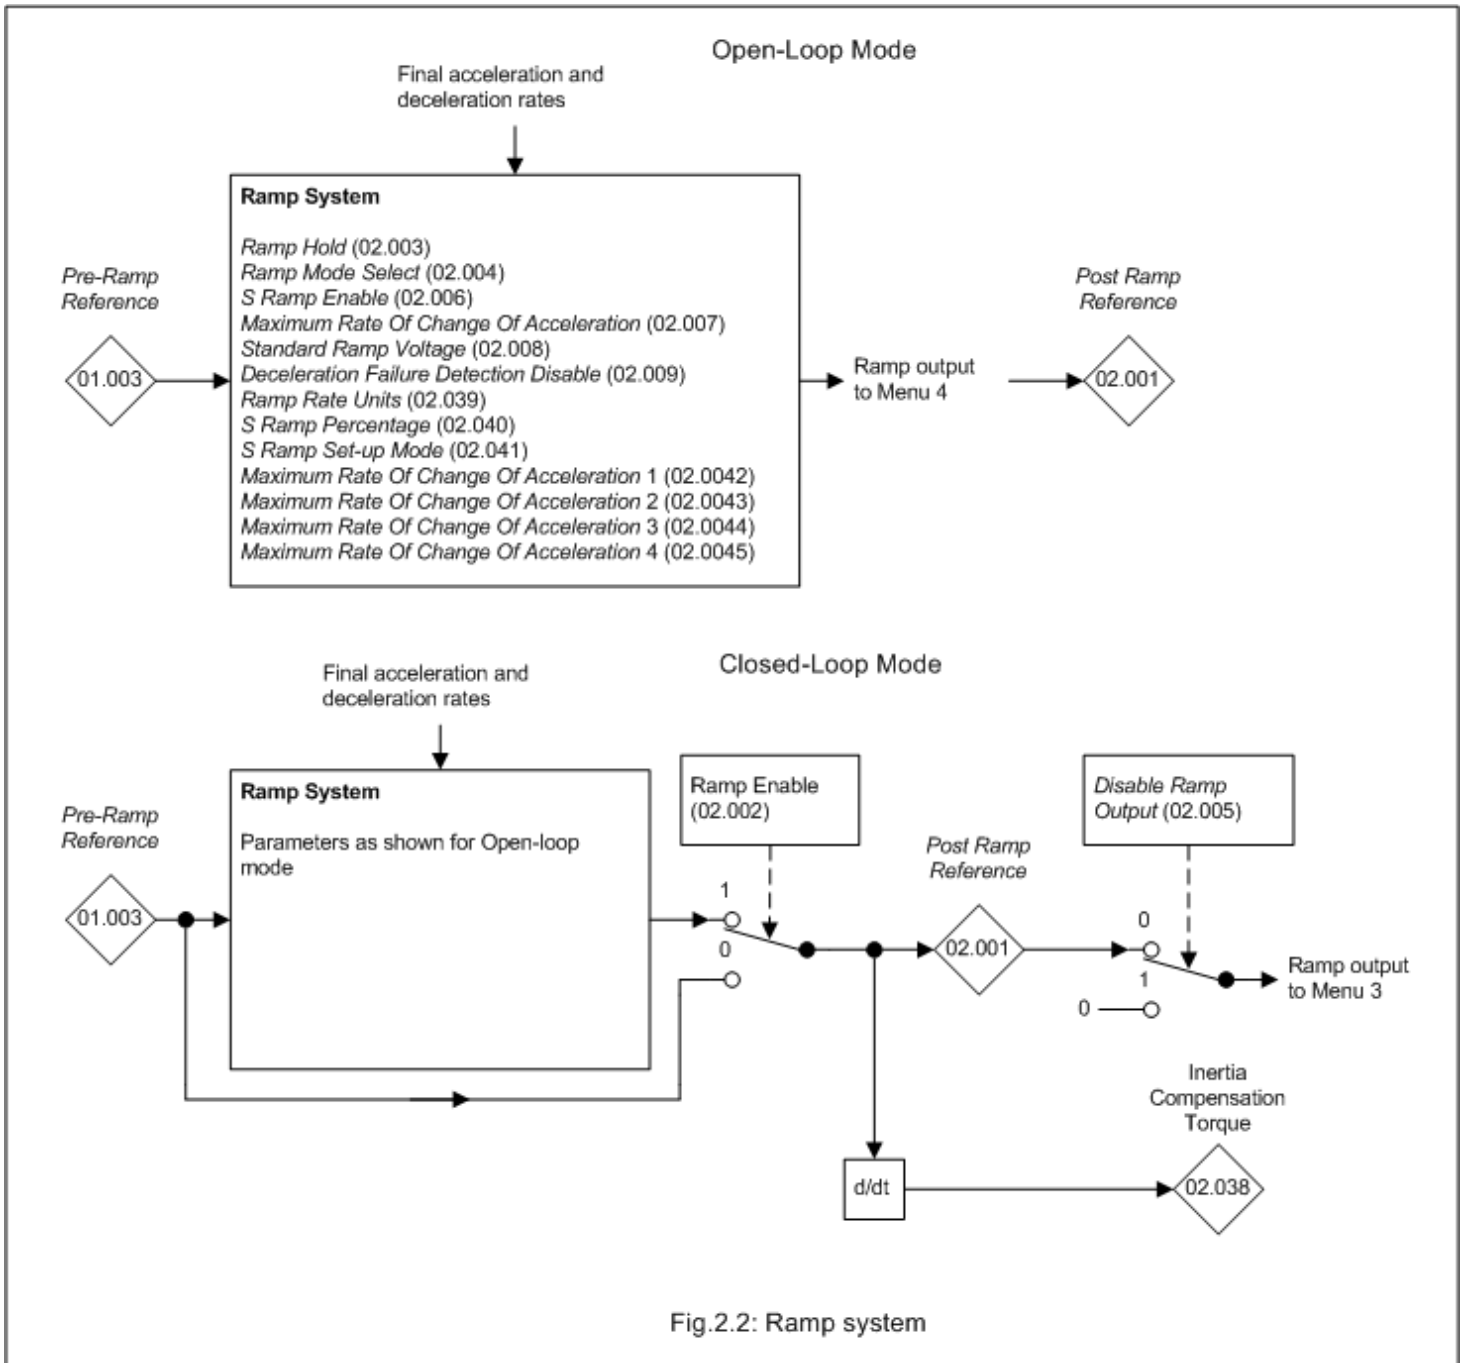

Fig.2.1: Acceleration and deceleration rate selection

Parameter	02.001 Post Ramp Reference		
Short description	Displays the output of the ramp system		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, VM, ND, NC, PT		

The *Post Ramp Reference* (02.001) can be combined with the *Hard Frequency Reference* (03.022) to give the final frequency reference at the input to the frequency controller (see Menu 03). If the *Hard Frequency Reference* (03.022) is used alone to give the final frequency reference, and the ramp output is not required, then the ramp output can be disconnected by setting *Disable Ramp Output* (02.005) = 1. This ensures that the reference and ramp systems do not affect the final frequency reference.

Parameter	02.002 Ramp Enable		
Short description	Set to 1 to enable the ramp system		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

If *Ramp Enable* (02.002) = 1 then the ramp system is present between the *Pre-ramp Reference* (01.003) and the *Post Ramp Reference* (02.001). If *Ramp Enable* (02.002) = 0 then any changes in the *Pre-ramp Reference* (01.003) are reflected immediately in the *Post Ramp Reference* (02.001).

Parameter	02.003 Ramp Hold		
Short description	Set to 1 to hold the ramp system at its present value		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Ramp Hold* (02.003) = 0 the ramp system functions normally. If *Ramp Hold* (02.003) is set to 1 and *S Ramp Enable* (02.006) = 0 the ramp system output is held at its current level. If *Ramp Hold* (02.003) is subsequently set to 0 the ramp system output is released and continues to operate normally. If *S Ramp Enable* (02.006) = 1 when *Ramp Hold* (02.003) is set to 1 the acceleration will ramp towards zero and the frequency will change in an S curve towards a constant frequency. If a drive stop is requested (i.e. *Reference On* (01.011) = 0) the ramp hold function is disabled.

Parameter	02.004 Ramp Mode Select		
Short description	Defines the mode used by the ramp system		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	1	Units	
Type	8 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Fast	Fast ramp
1	Standard	Standard ramp with normal motor voltage
2	Std boost	Standard ramp with high motor voltage
3	Fast boost	Fast ramp with high motor volts

Acceleration is defined as a positive (forward) or negative (reverse) frequency change away from zero, and deceleration is defined as a change towards zero. *Ramp Mode Select* (02.004) defines the ramp mode used for deceleration. During acceleration the frequency changes are based on the final acceleration rate only.

0: Fast ramp

During deceleration the frequency changes are based on the final deceleration rate.

1: Standard ramp

The standard ramp controller operates in a similar way to open-loop mode except that once the standard ramp controller becomes active it remains active until the RFC sequencer leaves the deceleration state. It is possible that the frequency may fall faster than the final deceleration rate as the motor reaches standstill.

2: Standard ramp with motor voltage boost

Standard ramp with motor voltage boost is the same as standard ramp mode except that the magnetising current is boosted to increase the motor losses and reduce the deceleration time.

If the *Standard Ramp Voltage* (02.008) is set to a level that is below the nominal d.c. link voltage level the motor will coast during deceleration because the torque producing current reference is limited to prevent the motor from accelerating. There are circumstances as listed below where the motor may not decelerate or even accelerate.

1. With a Synchronous machine a limited amount of motoring torque producing current is allowed to make the system operate correctly and in this case it is possible under some circumstances for the motor to accelerate slowly.
2. With a high inductance supply it is possible for the d.c. link voltage to rise as the motor frequency approaches zero, and so the motor will continue to rotate slowly and not stop.
3. An overhauling load can cause the motor to accelerate.

If *Deceleration Fail Detection Disable* (02.009) is at its default value of 0 the *Estimated Frequency* (03.002) is monitored. If these do not fall over a period of 10s the ramp output is forced to zero and the d.c. link voltage controller is disabled. If *Deceleration Fail Detection Disable* (02.009) = 1 this feature is disabled.

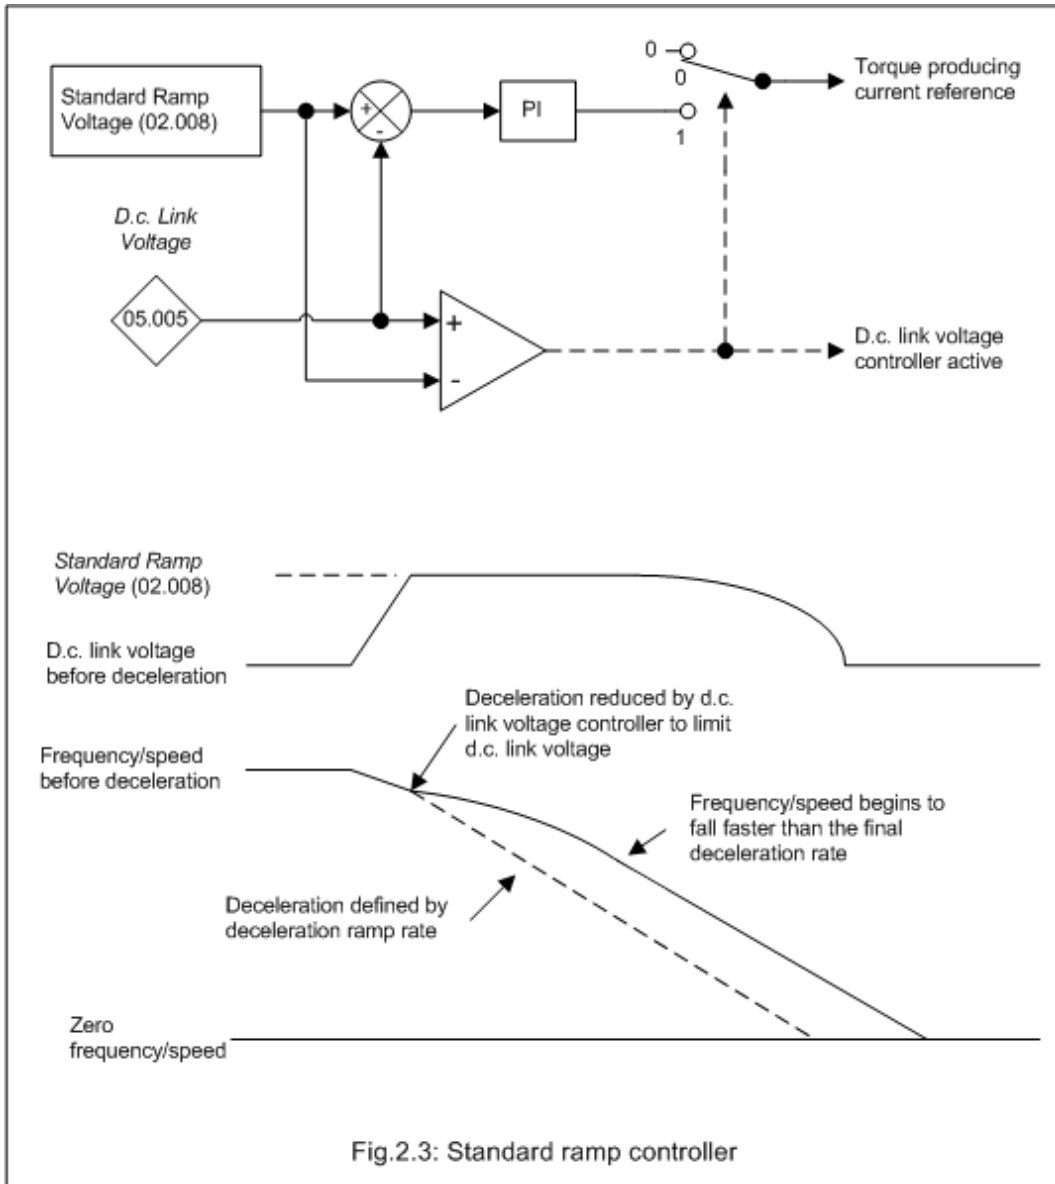

Fig.2.3: Standard ramp controller

3: Fast ramp with motor voltage boost

Fast ramp with motor voltage boost is the same as Fast ramp mode except that the magnetising current is boosted to increase the motor losses and reduce the deceleration time.

Parameter	02.005 Disable Ramp Output		
Short description	Set to 1 to disable the ramp system		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Post Ramp Reference* (02.001).

Parameter	02.006 S Ramp Enable		
Short description	Set to 1 to enable the use of S ramps		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW		

If *S Ramp Enable* (02.006) = 0 linear ramps are used, but if *S Ramp Enable* (02.006) = 1 an acceleration limit is applied to give S ramps. The S ramp function is disabled during deceleration when the standard ramp voltage controller is active. When the motor is accelerated again the acceleration ramp used by the S ramp function is reset to zero.

Parameter	02.007 Max Rate Of Change Of Acceleration		
Short description	Defines the maximum rate of change of acceleration used by the ramp system		
Mode	RFC-A		
Minimum	0.0	Maximum	300.0
Default	3.1	Units	s ² /100Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

A rate of change of acceleration ramp (S ramp) can be applied by different methods depending on the value of *S Ramp Set-up Mode* (02.041). If *S Ramp Set-up Mode* (02.041) = 0 then the maximum rate of change of acceleration in both directions, accelerating away from or towards zero, is defined by *Max Rate Of Change Of Acceleration* (02.007).

The general equations are given below for a linear ramp and an S ramp where

Δw is the required change of frequency.

a_{Max} is the maximum allowed acceleration in units of frequency/s

J_{Max} is the maximum rate of change of acceleration (i.e. jerk) in units of frequency/s²

The time for a linear ramp to give a change of frequency of Δw is

$$T_{Linear} = \Delta w \times a_{Max}$$

If an S ramp is used w_B is the change of frequency as the acceleration changes from zero to a_{Max} , i.e. the S shaped part of the frequency change.

$$w_B = a_{Max}^2 / 2J_{Max}$$

If the required frequency change is less than $2w_B$, i.e. Δw_B , then the acceleration never reaches its limit and the ramp does not contain a linear ramp section and the time for the ramp is given by

$$T_{Sramp1} = 2 \sqrt{(\Delta w / J_{Max})}$$

Otherwise

$$T_{Sramp2} = (\Delta w / a_{Max}) + (a_{Max} / J_{Max})$$

The diagram below shows a change of frequency from 0Hz to 50Hz with the ramp rate set to 5.0s / 100Hz and the *Max Rate Of Change Of Acceleration* (02.007) set to its default value of 3.1s² / 100Hz.

The required change of frequency $\Delta w = 50\text{Hz}$. The acceleration and jerk limits are converted from the parameter values as follows:

$$a_{\text{Max}} = 100 / \text{ramp rate} = 20.0 \text{ Hz/s}$$

$$J_{\text{Max}} = 100 / \text{Max Rate Of Change Of Acceleration} (02.007) = 32.3 \text{ Hz/s}^2$$

$$\text{The linear ramp time } T_{\text{Linear}} = \Delta w \times a_{\text{Max}} = 50.0 / 20.0 = 2.5\text{s}$$

$$\text{The frequency change for the acceleration to reach its limit } w_B = a_{\text{Max}}^2 / 2J_{\text{Max}} = 20.0^2 / (2 \times 32.3) = 6.19\text{Hz}$$

The required frequency change $\Delta w = 50\text{Hz}$ and this is greater than $2w_B$, i.e. $\Delta w > 2 \times 6.19\text{Hz}$ therefore the time for the ramp

$$T_{\text{Srampp2}} = (\Delta w / a_{\text{Max}}) + (a_{\text{Max}} / J_{\text{Max}}) = (50.0 / 20.0) + (20.0 / 32.3) = 2.5 + 0.62 = 3.12\text{s}.$$

Note that the default value of *Max Rate Of Change Of Acceleration* (02.007) has been chosen so that when it is combined with the default acceleration rate, the ramp is extended by approximately 25% compared to the linear ramp.

If the required change of frequency had been 5.0Hz, i.e. less than $2 \times w_B$, then the alternative equation should be used:

$$T_{\text{Srampp1}} = 2 \sqrt{(\Delta w / J_{\text{Max}})} = 2 \sqrt{(5.0 / 32.3)} = 0.78\text{s}.$$

Parameter	02.008 Standard Ramp Voltage		
Short description	Defines the standard ramp voltage used by the ramp system		
Mode	RFC-A		
Minimum	-VM_DC_VOLTAGE_SET	Maximum	VM_DC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Region	Default Value
110V	All	375
200V	All	375
400V	50Hz	750
400V	60Hz	775
575V	All	895
690V	All	1075

See Ramp Mode Select (02.004).

Parameter	02.009 Deceleration Fail Detection Disable		
Short description	Set to 1 to disable the deceleration fal detection function		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See Ramp Mode Select (02.004).

Parameter	02.010 Acceleration Rate Selector		
Short description	Defines which acceleration rate is used by the ramp system		
Mode	RFC-A		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW		

The *Acceleration Rate Selector* (02.010) is used to either select an acceleration rate directly or to define the method used to select an acceleration rate. If $1 \leq \text{Acceleration Rate Selector (02.010)} \leq 8$ the acceleration rate is selected directly, i.e. 1 selects *Acceleration Rate 1* (02.011), 2 selects *Acceleration Rate 2* (02.012), etc. If *Acceleration Rate Selector* (02.010) = 0 the acceleration rate is selected with the acceleration rate select bits as shown in the table below.

Acceleration Rate Select Bit 2 (02.034)	Acceleration Rate Select Bit 1 (02.033)	Acceleration Rate Select Bit 0 (02.032)	Acceleration rate selected
0	0	0	<i>Acceleration Rate 1</i> (02.011)
0	0	1	<i>Acceleration Rate 2</i> (02.012)
0	1	0	<i>Acceleration Rate 3</i> (02.013)
0	1	1	<i>Acceleration Rate 4</i> (02.014)
1	0	0	<i>Acceleration Rate 5</i> (02.015)
1	0	1	<i>Acceleration Rate 6</i> (02.016)
1	1	0	<i>Acceleration Rate 7</i> (02.017)
1	1	1	<i>Acceleration Rate 8</i> (02.018)

If *Acceleration Rate Selector* (02.010) = 9 the acceleration rate is selected based on the value of *Preset Selected Indicator* (01.050), i.e. 1 selects *Acceleration Rate 1* (02.011), 2 selects *Acceleration Rate 2* (02.012), etc.

Parameter	02.011 Acceleration Rate 1		
Short description	Defines the acceleration rate present in acceleration rate 1		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Ramp Rate Units* (02.039) for the definition of Ramp rate frequency.

Acceleration Rate 1 (02.011) - *Acceleration Rate 8* (02.018) can be selected to define the linear ramp rate. The acceleration rate applies when the frequency is changing away from zero.

Selecting a ramp rate that has been set to zero in Asynchronous mode disables the ramp system so that the *Post Ramp Reference* (02.001) follows the *Pre-ramp Reference* (01.003) without any delay for acceleration or deceleration. It should be noted that this also disables the standard ramp d.c. link voltage controller and the frequency based current limits.

Parameter	02.012 Acceleration Rate 2		
Short description	Defines the acceleration rate present in acceleration rate 2		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Acceleration Rate 1* (02.011).

Parameter	02.013 Acceleration Rate 3		
Short description	Defines the acceleration rate present in acceleration rate 3		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Acceleration Rate 1* (02.011).

Parameter	02.014 Acceleration Rate 4		
Short description	Defines the acceleration rate present in acceleration rate 4		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Acceleration Rate 1* (02.011).

Parameter	02.015 Acceleration Rate 5		
Short description	Defines the acceleration rate present in acceleration rate 5		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Acceleration Rate 1* (02.011).

Parameter	02.016 Acceleration Rate 6		
Short description	Defines the acceleration rate present in acceleration rate 6		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Acceleration Rate 1* (02.011).

Parameter	02.017 <i>Acceleration Rate 7</i>		
Short description	Defines the acceleration rate present in acceleration rate 7		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Acceleration Rate 1* (02.011).

Parameter	02.018 <i>Acceleration Rate 8</i>		
Short description	Defines the acceleration rate present in acceleration rate 8		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Acceleration Rate 1* (02.011).

Parameter	02.019 <i>Jog Acceleration Rate</i>		
Short description	Defines the acceleration rate present when the jog function is selected		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	0.2	Units	s
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Ramp Rate Units* (02.039) for the definition of Ramp rate frequency.

The *Jog Acceleration Rate* (02.019) is selected when *Jog Select* (01.013) is active and when the frequency is changing away from zero in either direction.

Parameter	02.020 <i>Deceleration Rate Selector</i>		
Short description	Defines which deceleration rate is used by the ramp system		
Mode	RFC-A		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW		

The *Deceleration Rate Selector* (02.020) operates in the same way as the *Acceleration Rate Selector* (02.010). If *Deceleration Rate Selector* (02.020) = 0 the deceleration rate is selected with the deceleration rate select bits as shown in the table below.

<i>Deceleration Rate Select Bit 2</i> (02.037)	<i>Deceleration Rate Select Bit 1</i> (02.036)	<i>Deceleration Rate Select Bit 0</i> (02.035)	<i>Deceleration rate selected</i>
0	0	0	<i>Deceleration Rate 1</i> (02.021)
0	0	1	<i>Deceleration Rate 2</i> (02.022)
0	1	0	<i>Deceleration Rate 3</i> (02.023)
0	1	1	<i>Deceleration Rate 4</i> (02.024)
1	0	0	<i>Deceleration Rate 5</i> (02.025)
1	0	1	<i>Deceleration Rate 6</i> (02.026)
1	1	0	<i>Deceleration Rate 7</i> (02.027)
1	1	1	<i>Deceleration Rate 8</i> (02.028)

Parameter	02.021 Deceleration Rate 1		
Short description	Defines the deceleration rate present in deceleration rate 1		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	10.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Ramp Rate Units* (02.039) for the definition of Ramp rate frequency

Deceleration Rate 1 (02.021) - *Deceleration Rate 8* (02.028) can be selected to define the linear ramp rate. The deceleration rate applies when the frequency is changing towards zero.

Selecting a ramp rate that has been set to zero in Asynchronous mode disables the ramp system so that the *Post Ramp Reference* (02.001) follows the *Pre-ramp Reference* (01.003) without any delay for acceleration or deceleration. It should be noted that this also disables the standard ramp d.c. link voltage controller and the frequency based current limits.

Parameter	02.022 Deceleration Rate 2		
Short description	Defines the deceleration rate present in deceleration rate 2		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	10.0	Units	s
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1

Parameter	02.029 <i>Jog Deceleration Rate</i>		
Short description	Defines the deceleration rate present when the jog function is selected		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	0.2	Units	s
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Ramp Rate Units* (02.039) for the definition of Ramp rate frequency.

The *Jog Deceleration Rate* (02.029) is selected when *Jog Select* (01.013) is active and when the frequency is changing towards zero in either direction.

Parameter	02.030 <i>Acceleration Rate Selected</i>		
Short description	Indicates which acceleration rate is selected		
Mode	RFC-A		
Minimum	0	Maximum	8
Default		Units	
Type	8 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Acceleration Rate Selected (02.030) shows a value between 1 and 8 that corresponds to *Acceleration Rate 1* (02.011) to *Acceleration Rate 8* (02.018) indicating which of these acceleration rates is actually being used.

Deceleration Rate Selected (02.031) shows a value between 1 and 8 that corresponds to *Deceleration Rate 1* (02.021) to *Deceleration Rate 8* (02.028) indicating which of these deceleration rates is actually being used.

Parameter	02.031 <i>Deceleration Rate Selected</i>		
Short description	Indicates which deceleration rate is selected		
Mode	RFC-A		
Minimum	0	Maximum	8
Default		Units	
Type	8 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Acceleration Rate Selected* (02.030).

Parameter	02.032 Acceleration Rate Select Bit 0		
Short description	Defines which acceleration rate is used if acceleration rate selector = 0		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Acceleration Rate Selector* (02.010).

Parameter	02.033 Acceleration Rate Select Bit 1		
Short description	Defines which acceleration rate is used if acceleration rate selector = 0		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Acceleration Rate Selector* (02.010).

Parameter	02.034 Acceleration Rate Select Bit 2		
Short description	Defines which acceleration rate is used if acceleration rate selector = 0		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Acceleration Rate Selector* (02.010).

Parameter	02.035 Deceleration Rate Select Bit 0		
Short description	Defines which deceleration rate is used if deceleration rate selector = 0		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Deceleration Rate Selector* (02.020).

Parameter	02.036 Deceleration Rate Select Bit 1		
Short description	Defines which deceleration rate is used if deceleration rate selector = 0		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Deceleration Rate Selector* (02.020).

Parameter	02.037 Deceleration Rate Select Bit 2		
Short description	Defines which deceleration rate is used if deceleration rate selector = 0		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Deceleration Rate Selector* (02.020).

Parameter	02.038 Inertia Compensation Torque		
Short description	Displays the torque as a percentage of rated torque		
Mode	RFC-A		
Minimum	-1000.0	Maximum	1000.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

The *Motor and Load Inertia* (03.018), *Torque Per Amp* (05.032) and the rate of change of the *Post Ramp Reference* (02.001) are used to produce a torque feed-forwards value that should accelerate and decelerate the load at the required rate. This value can be used as a feed-forwards term that is added to the speed controller output if *Inertia Compensation Enable* (04.022) = 1. *Inertia Compensation Torque* (02.038) gives the torque as a percentage of rated torque.

Parameter	02.039 Ramp Rate Units		
Short description	Defines the units used by the ramp system		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

The ramp rate parameters (*Acceleration Rate 1* (02.011) - *Acceleration Rate 8* (02.018), *Jog Acceleration Rate* (02.019), *Deceleration Rate 1* (02.021) - *Deceleration Rate 8* (02.028) and *Jog Deceleration Rate* (02.029)) are specified in s / Ramp rate. Ramp rate frequency is selected with Ramp Rate Units (02.039) as defined in the table below.

Ramp Rate Units (02.039)	Ramp rate frequency
0	Seconds per 100Hz
1	Seconds per Maximum Frequency
2	Seconds per 1000Hz

Maximum frequency is defined by *Maximum Reference Clamp* (01.006) if *Select Motor 2 Parameters* (11.045) = 0, or *M2 Maximum Reference Clamp* (21.001) if *Select Motor 2 Parameters* (11.045) = 1.

Parameter	02.040 S Ramp Percentage		
Short description	Defines the profile of the S ramp system as a percentage		
Mode	RFC-A		
Minimum	0.0	Maximum	50.0
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

If *S Ramp Set-up Mode* (02.041) = 1 the percentage of the ramp to Maximum frequency that includes half the S ramp profile can be specified with *S Ramp Percentage* (02.040) as shown in the diagram below. Maximum frequency is defined by *Maximum Reference Clamp* (01.006) if *Select Motor 2 Parameters* (11.045) = 0, or *M2 Maximum Reference Clamp* (21.001) if *Select Motor 2 Parameters* (11.045) = 1. It should be noted that the time to ramp to Maximum frequency does not change as *S Ramp Percentage* (02.040) is changed, but the maximum acceleration rate in the centre of the profile increases.

Parameter	02.041 S Ramp Set-up Mode		
Short description	Defines the mode used by the S ramp system		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

S Ramp Set-up Mode (02.041) defines the method used to set up the S ramp function.

0: Single maximum rate of change of acceleration

The maximum rate of change of acceleration in either direction, when the frequency is changing away from or towards zero, is defined by *Max Rate Of Change Of Acceleration (02.007)*.

1: S ramp percentage

A single maximum rate of change of acceleration is used in either direction, when the frequency is changing away from or towards zero, but this is specified as the percentage of the ramp from zero to Maximum frequency which is covered by the S shaped profile. See *S Ramp Percentage (02.040)*.

2: Four independent maximum rate of change of acceleration values

The maximum rate of change of acceleration can be specified as four independent values. See *Max Rate Of Change Of Acceleration (02.007)*.

Parameter	02.042 Maximum Rate Of Change Of Acceleration 1		
Short description	Defines the 1st maximum rate of change of acceleration used by the S ramp system		
Mode	RFC-A		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	s ² /100Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

If *S Ramp Set-up Mode (02.041)* = 2 it is possible to set up four independent maximum rate of change of acceleration values as shown in the diagram below. The values from 1 to 4 correspond to *Maximum Rate Of Change Of Acceleration 1 (02.042)* to *Maximum Rate Of Change Of Acceleration 4 (02.045)* respectively.

Fig.2.6: S ramp set-up with four maximum rate of change of acceleration values

Parameter	02.043 Maximum Rate Of Change Of Acceleration 2		
Short description	Defines the 2nd maximum rate of change of acceleration used by the S ramp system		
Mode	RFC-A		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	s ² /100Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See Maximum Rate Of Change Of Acceleration 1 (02.042).

Parameter	02.044 Maximum Rate Of Change Of Acceleration 3		
Short description	Defines the 3rd maximum rate of change of acceleration used by the S ramp system		
Mode	RFC-A		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	s ² /100Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See Maximum Rate Of Change Of Acceleration 1 (02.042).

Parameter	02.045 Maximum Rate Of Change Of Acceleration 4		
Short description	Defines the 4th maximum rate of change of acceleration used by the S ramp system		
Mode	RFC-A		
Minimum	0.0	Maximum	300.0
Default	0.0	Units	s ² /100Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See Maximum Rate Of Change Of Acceleration 1 (02.042).

Menu 3 Single Line Descriptions – Frequency and Speed Feedback

Mode: RFC-A

Parameter		Range	Default	Type

Menu 3 – Frequency and Speed Feedback

Mode: RFC-A

The drive can operate under Open Loop and RFC modes with respect to frequency and current control and can drive asynchronous machines. The open loop asynchronous control is further broken down into vector and fixed boost modes

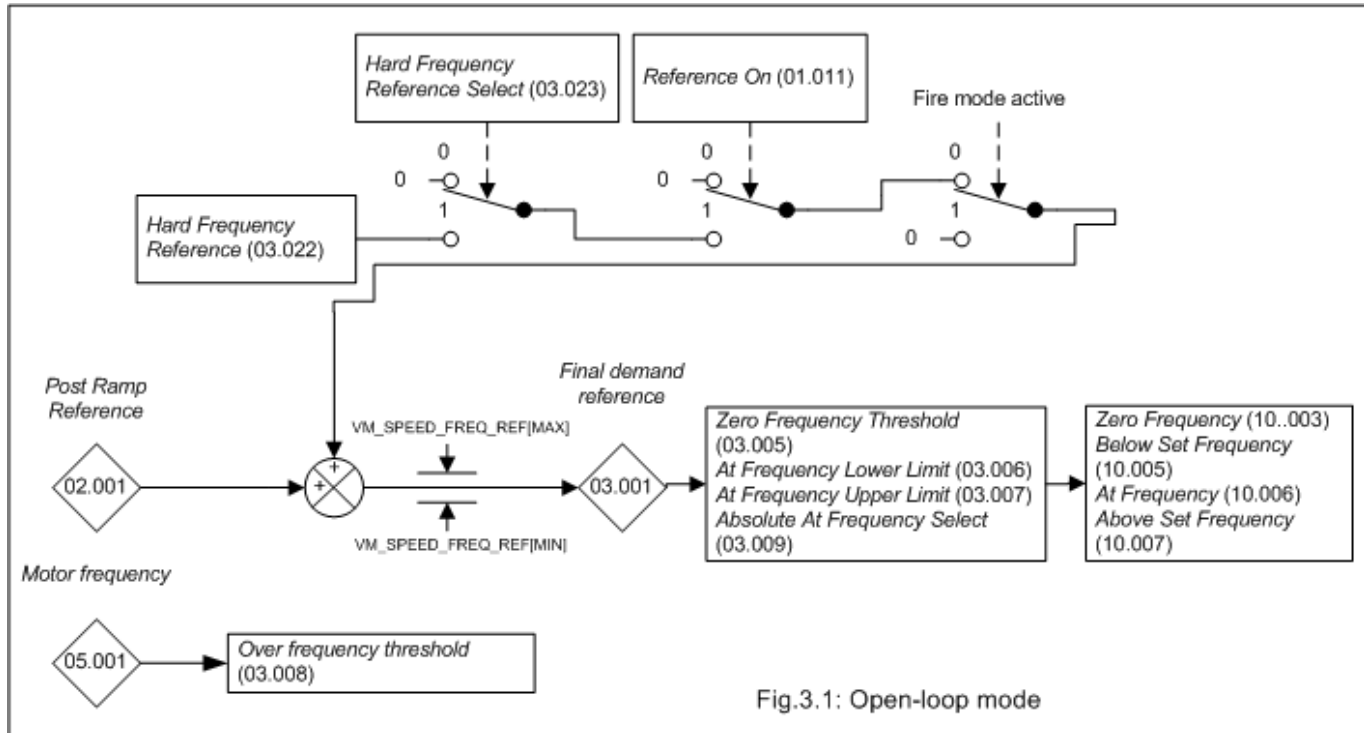

Fig.3.1: Open-loop mode

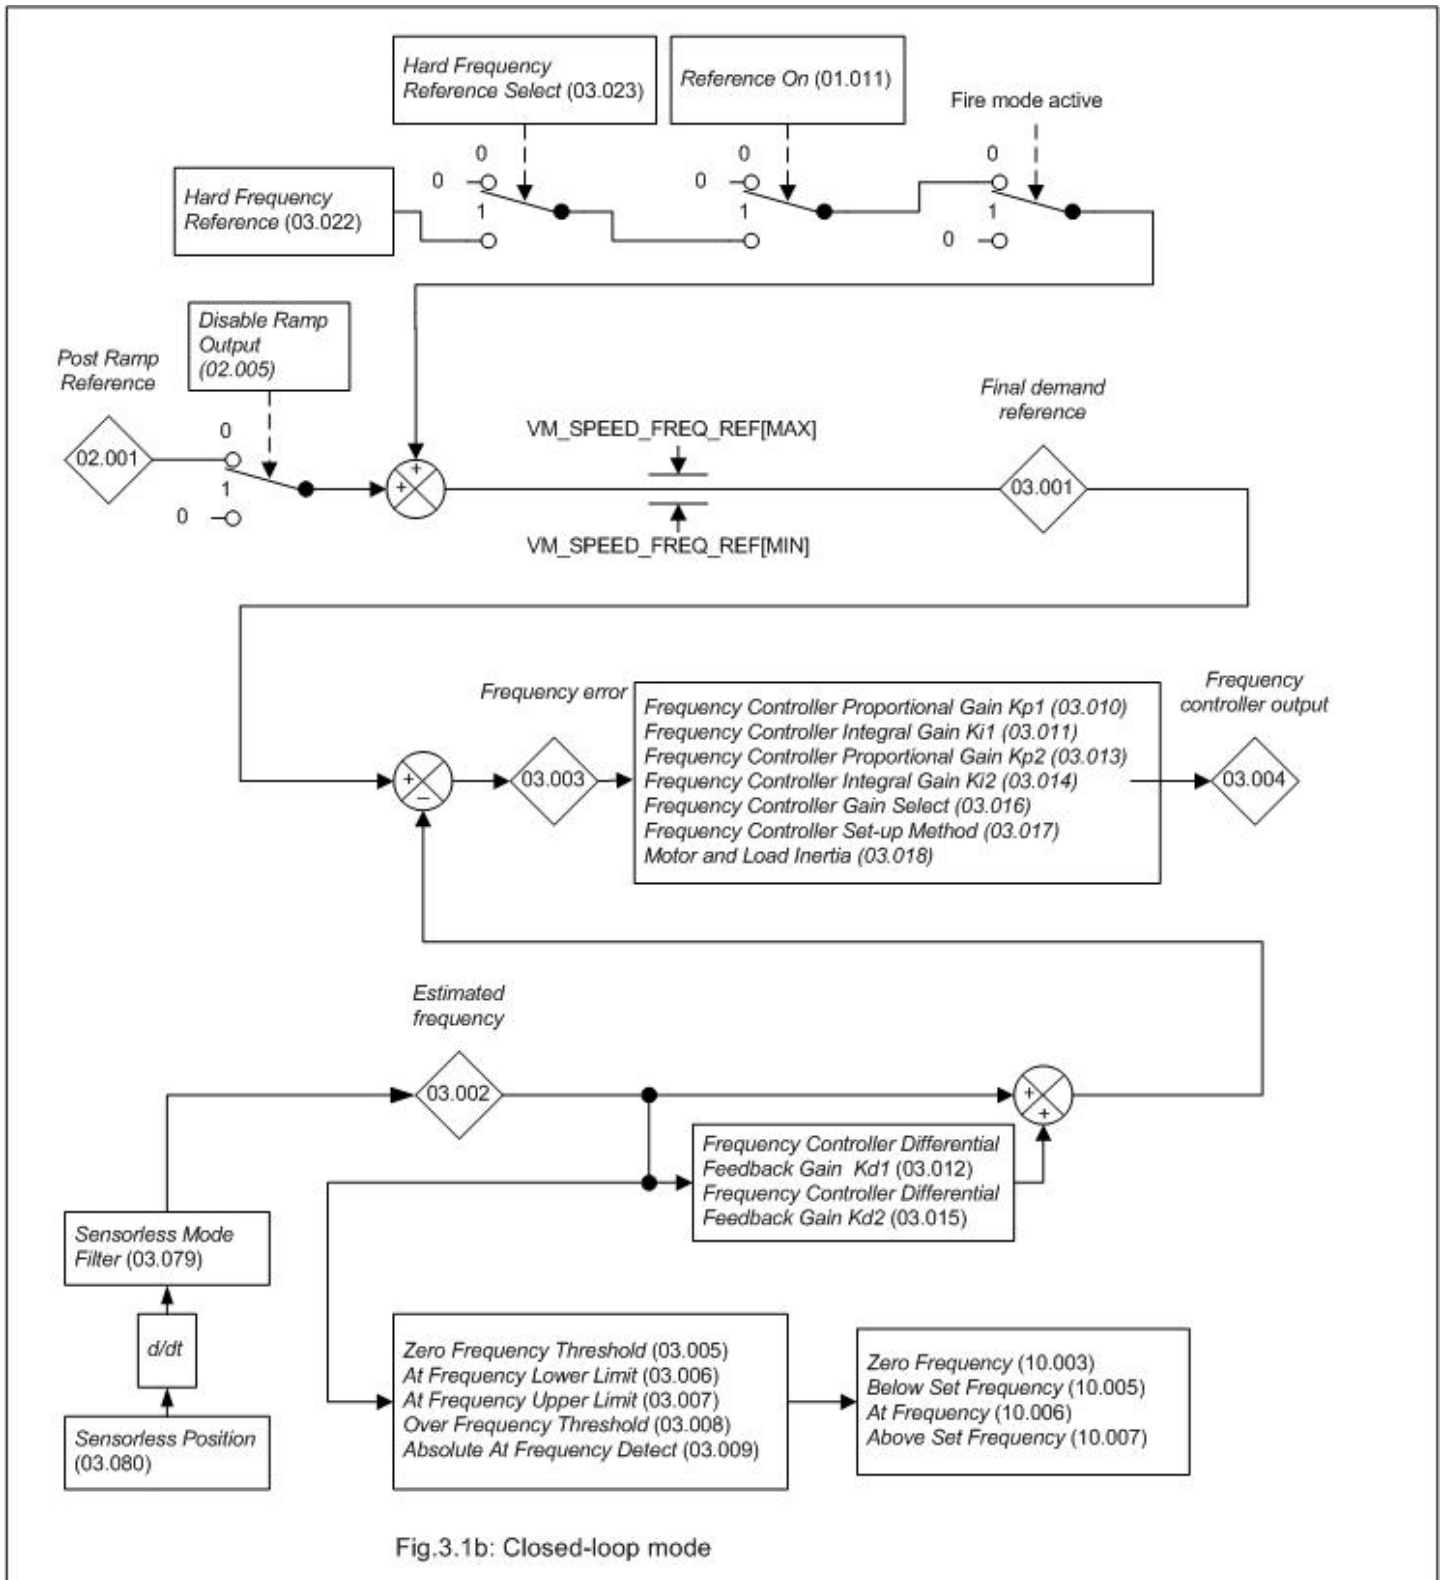

Fig.3.1b: Closed-loop mode

Parameter	03.001 Final Demand Reference			
Short description	Displays the final reference to the frequency controller			
Mode	RFC-A			
Minimum	-VM_FREQ	Maximum	VM_FREQ	
Default		Units	Hz	
Type	32 Bit Volatile	Update Rate	16ms	
Display Format	Standard	Decimal Places	2	
Coding	RO, FI, VM, ND, NC, PT			

Open loop mode:

Final Demand Reference (03.001) shows the fundamental drive output frequency from the Post Ramp Reference (02.001) and the Hard Frequency Reference (03.022).

RFC modes:

Final Demand Reference (03.001) shows the reference at the input to the frequency controller, which is the sum of the Post Ramp Reference (02.001) if the ramp output is not disabled and the hard frequency reference (if enabled). If the drive is disabled Final Demand Reference (03.001) shows 0.00.

Parameter	03.002 <i>Estimated Frequency</i>		
Short description	Displays the frequency feedback selected for the frequency controller		
Mode	RFC-A		
Minimum	-VM_FREQ	Maximum	VM_FREQ
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, VM, ND, NC, PT		

Estimated Frequency (03.002) shows the level of the frequency feedback selected for the frequency controller.

Parameter	03.003 <i>Frequency Error</i>		
Short description	Displays the error between the final frequency demand and the estimated frequency		
Mode	RFC-A		
Minimum	-VM_FREQ	Maximum	VM_FREQ
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, VM, ND, NC, PT		

RFC modes only. Will be set to zero in open loop modes.

The frequency error is the difference between the final frequency demand and the estimated frequency and does not include the effect of the differential term in the frequency controller feedback branch.

Parameter	03.004 <i>Frequency Controller Output</i>		
Short description	Displays the output of the frequency controller		
Mode	RFC-A		
Minimum	-VM_TORQUE_CURRENT	Maximum	VM_TORQUE_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

RFC modes only. Will be set to zero in open loop modes.

The output of the frequency regulator is a torque demand given as a percentage of rated motor torque. It should be noted that this will be modified to take into account the level of motor flux if field weakening is active before it is converted into the *Final Current Reference* (04.004).

Parameter	03.005 <i>Zero Frequency Threshold</i>		
Short description	Defines the threshold for detecting the zero frequency condition		
Mode	RFC-A		
Minimum	0.00	Maximum	20.00
Default	2.00	Units	Hz
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

If the *Post Ramp Reference* (02.001) is at or below the level defined by this parameter in either direction *Zero Frequency* (10.003) = 1, otherwise *Zero Frequency* (10.003) = 0.

Parameter	03.006 <i>At Frequency Lower Limit</i>		
Short description	Defines the lower limit for detecting the at frequency condition		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	1.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

At Frequency (10.006) is set if the *Estimated Frequency* (03.002) is on the boundaries or within the at speed window. *Above Set Frequency* (10.007) and *Below Set Frequency* (10.005) are set if the feedback is above or below the window respectively.

If *Absolute At Frequency Select* (03.009) = 0 reference window mode is used.
The "at speed" condition is true if,

$$(|\text{Pre-ramp Reference (01.003)}| - \text{At Frequency Lower Limit (03.006)}) \leq |\text{Estimated Frequency (03.002)}| \leq (|\text{Pre-ramp Reference (01.003)}| + \text{At Frequency Upper Limit (03.007)})$$

(If the lower limit is less than zero then zero is used as the lower limit.)

If *Absolute At Frequency Select* (03.009) = 1 absolute window mode is used.
The "at speed" condition is true if,

$At\ Frequency\ Lower\ Limit\ (03.006) \leq |Estimated\ Frequency\ (03.002)| \leq At\ Frequency\ Upper\ Limit\ (03.007)$

Note: All flags are cleared if *Reference On* (01.011) is 0.

Parameter	03.007 <i>At Frequency Upper Limit</i>		
Short description	Defines the upper limit for detecting the at frequency condition		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	1.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *At Frequency Lower Limit* (03.006).

Parameter	03.008 <i>Over Frequency Threshold</i>		
Short description	Defines the threshold used to detect the over frequency condition		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

If *Over Frequency Threshold* (03.008) is set to a non-zero value it defines the over frequency threshold. If the *Estimated Frequency* (03.002) exceeds this threshold in either direction an *Over Speed* trip is produced. If *Over Frequency Threshold* (03.008) is set to 0.0 the threshold is based on the variable minimum/maximum for the references and is equal to $1.2 \times VM_SPEED_FREQ_REF[MAX]$.

Parameter	03.009 <i>Absolute At Frequency Select</i>		
Short description	Set to 1 to select absolute at frequency		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *At Frequency Lower Limit* (03.006).

Parameter	03.010 <i>Frequency Controller Proportional Gain Kp1</i>		
Short description	Defines the proportional gain for frequency controller 1		
Mode	RFC-A		
Minimum	0.000	Maximum	200.000
Default	0.100	Units	s/rad
Type	32 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	3
Coding	RW		

RFC modes only.

The diagram below shows a generalised representation of the frequency controller. The controller includes a feed forward proportional gain (Kp), a feed forward integral gain (Ki), and a differential feedback gain (Kd).

The drive holds two sets of these gains and either set may be selected for use by the frequency controller with *Frequency Controller Gain Select* (03.016). If *Frequency Controller Gain Select* (03.016) = 0, gains Kp1, Ki1 and Kd1 are used, and if *Frequency Controller Gain Select* (03.016) = 1, gains Kp2, Ki2 and Kd2 are used.

If *Frequency Controller Gain Select* (03.016) = 2, Kp1 etc are used while the modulus of the frequency demand is less than the value held by *Gain Change Threshold* (03.017), else Kp2 etc will be used.

If *Frequency Controller Gain Select* (03.016) is changed when the drive is enabled, the controller output is kept constant by modifying the level of the integral term accumulator so that the transient produced is minimised.

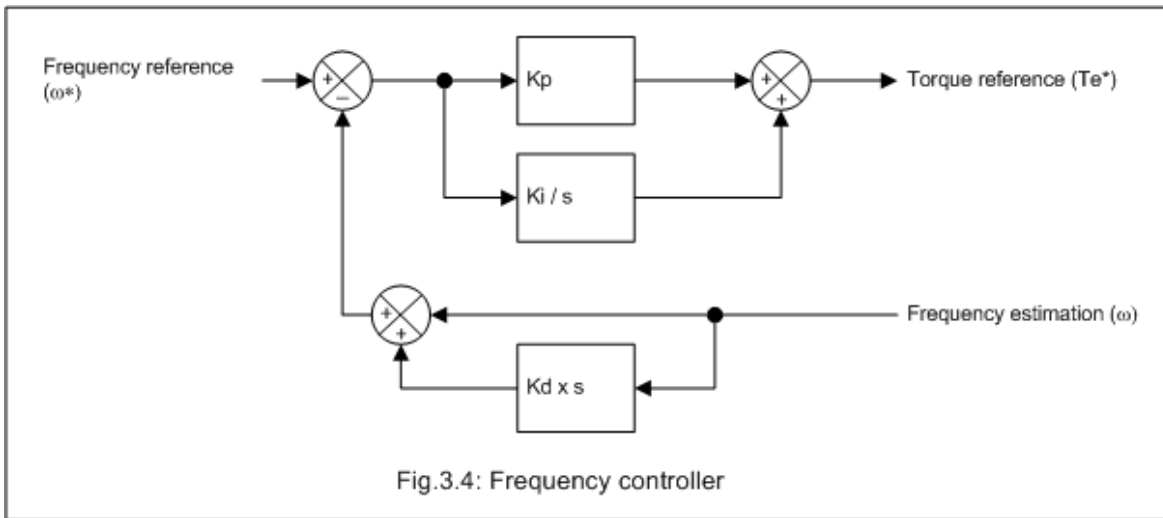

Fig.3.4: Frequency controller

Proportional gain (Kp)

If Kp is non-zero and Ki is zero the controller will only have a proportional term, and there must be a frequency error to produce a torque reference. Therefore as the motor load increases there will be a difference between the reference and actual frequencies. This effect, called regulation, depends on the level of the proportional gain, the higher the gain the smaller the frequency error for a given load. If the proportional gain is too high the closed-loop stability limit may be reached.

Integral gain (Ki)

The integral gain is provided to prevent frequency regulation. The error is accumulated over a period of time and used to produce the necessary torque reference without any frequency error. Increasing the integral gain reduces the time taken for the frequency to reach the correct level and increases the stiffness of the system, i.e. it reduces the positional displacement produced by applying a load torque to the motor. Unfortunately increasing the integral gain also reduces the system damping giving overshoot after a transient. For a given integral gain the damping can be improved by increasing the proportional gain. A compromise must be reached where the system response, stiffness and damping are all adequate for the application. The integral term is implemented in the form of $(K_i \times \text{error})$, and so the integral gain can be changed when the controller is active without causing large transients on the torque reference.

Differential gain (Kd)

The differential gain is provided in the feedback of the frequency controller to give additional damping. The differential term is implemented in a way that does not introduce excessive noise normally associated with this type of function. Increasing the differential term reduces the overshoot produced by under-damping, however for most applications the proportional and integral gains alone are sufficient.

It should be noted that the differential term is limited internally so that it is ineffective if frequency in Hz x Kd x Ki is greater than 170.

To analyse the performance of the frequency controller it may be represented as an s-domain model as shown below.

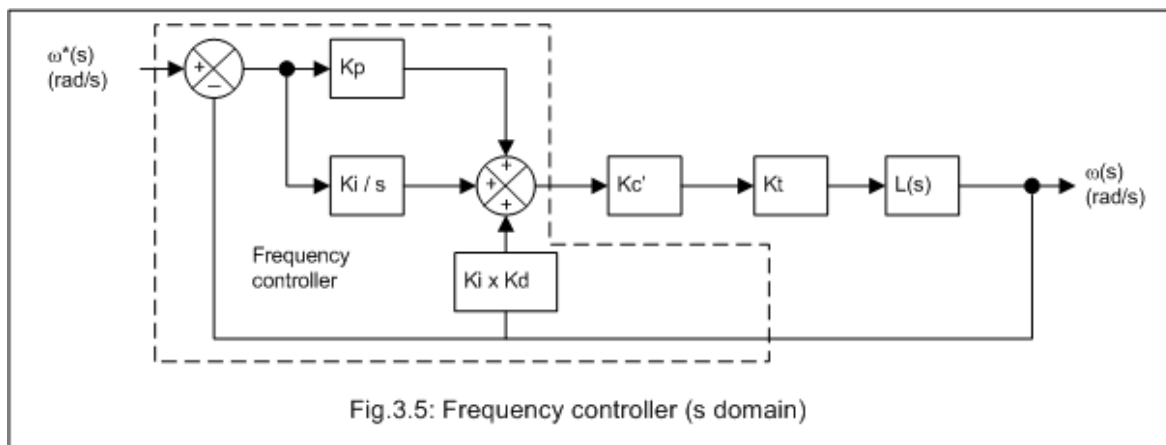

Fig.3.5: Frequency controller (s domain)

Kc' is the conversion between the frequency controller output and the torque producing current reference. A value of unity at the output of the frequency controller gives a torque producing current equal to Kc'. The drive automatically compensates the torque producing current reference for flux variations in field weakening, and so Kc' can be assumed to have a constant value even in field weakening. $Kc' = \text{Full Scale Current } Kc (11.061) \times 0.45$.

Kt is the torque constant of the motor (i.e. torque in Nm per amp of torque producing current). For induction motors the value must be calculated from the motor parameters. In RFC-A mode this calculation is performed by the drive and the result is stored in *Torque Per Amp* (05.032).

L(s) is the transfer function of the load.

Parameter	03.011 Frequency Controller Integral Gain Ki1		
Short description	Defines the integral gain for frequency controller 1		
Mode	RFC-A		
Minimum	0.00	Maximum	655.35
Default	0.10	Units	s ² /rad
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

RFC modes only.

See *Frequency Controller Proportional Gain Kp1* (03.010).

Parameter	03.012 Frequency Controller Differential Feedback Gain Kd1		
Short description	Defines the differential gain for frequency controller 1		
Mode	RFC-A		
Minimum	0.00000	Maximum	0.65535
Default	0.00000	Units	1/rad
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	5
Coding	RW, BU		

RFC modes only.

See *Frequency Controller Proportional Gain Kp1* (03.010).

Parameter	03.013 Frequency Controller Proportional Gain Kp2		
Short description	Defines the proportional gain for frequency controller 2		
Mode	RFC-A		
Minimum	0.000	Maximum	200.000
Default	0.100	Units	s/rad
Type	32 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	3
Coding	RW		

RFC modes only.

See *Frequency Controller Proportional Gain Kp1* (03.010).

Parameter	03.014 Frequency Controller Integral Gain Ki2		
Short description	Defines the integral gain for frequency controller 2		
Mode	RFC-A		
Minimum	0.00	Maximum	655.35
Default	0.10	Units	s ² /rad
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

RFC modes only.

See *Frequency Controller Proportional Gain Kp1* (03.010).

Parameter	03.015 Frequency Controller Differential Feedback Gain Kd2		
Short description	Defines the differential gain for frequency controller 2		
Mode	RFC-A		
Minimum	0.00000	Maximum	0.65535
Default	0.00000	Units	1/rad
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	5
Coding	RW, BU		

RFC modes only.

See *Frequency Controller Proportional Gain Kp1* (03.010).

Parameter	03.016 Frequency Controller Gain Select		
Short description	Defines which gains are used for the frequency controller		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW		

RFC modes only.

See *Frequency Controller Proportional Gain Kp1* (03.010).

Value	Selection
0	Kp1, Ki1 & Kd1 used
1	Kp2, Ki2 & Kd2 used
2	Automatic gain change at frequency threshold (Gain Change Threshold (03.017))

Parameter	03.017 Gain Change Threshold		
Short description	Defines the threshold that changes between the two sets of gains for the frequency controller		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RW		

RFC modes only.

See *Frequency Controller Proportional Gain Kp1* (03.010).

Parameter	03.018 Motor and Load Inertia		
Short description	Displays the inertia of the motor and load		
Mode	RFC-A		
Minimum	0.00	Maximum	1000.00
Default	0.00	Units	kgm ²
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

The motor and load inertia represents the total inertia driven by the motor. This is used to provide torque feed-forwards during acceleration when required (see *Torque Mode Selector* (04.011)).

It is possible to measure the inertia as part of the auto-tune process (See *Auto-tune* (05.012))

Parameter	03.022 Hard Frequency Reference		
Short description	Defines the value of the hard frequency reference		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	4ms
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

The *Hard Frequency Reference* (03.022) is a reference value which does not pass through the ramp system, but is added directly to the *Post Ramp Reference* (02.001). The *Hard Frequency Reference* (03.022) is only added when selected by the *Hard Frequency Reference Select* (03.023) and *Reference On* (01.011) is active.

Parameter	03.023 Hard Frequency Reference Select		
Short description	Set to 1 to enable the use of the hard frequency reference		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Hard Frequency Reference* (03.022).

Parameter	03.029 Position		
Short description	Displays the position counter in frequency or encoder mode		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RO, FI, ND, NC, PT, BU		

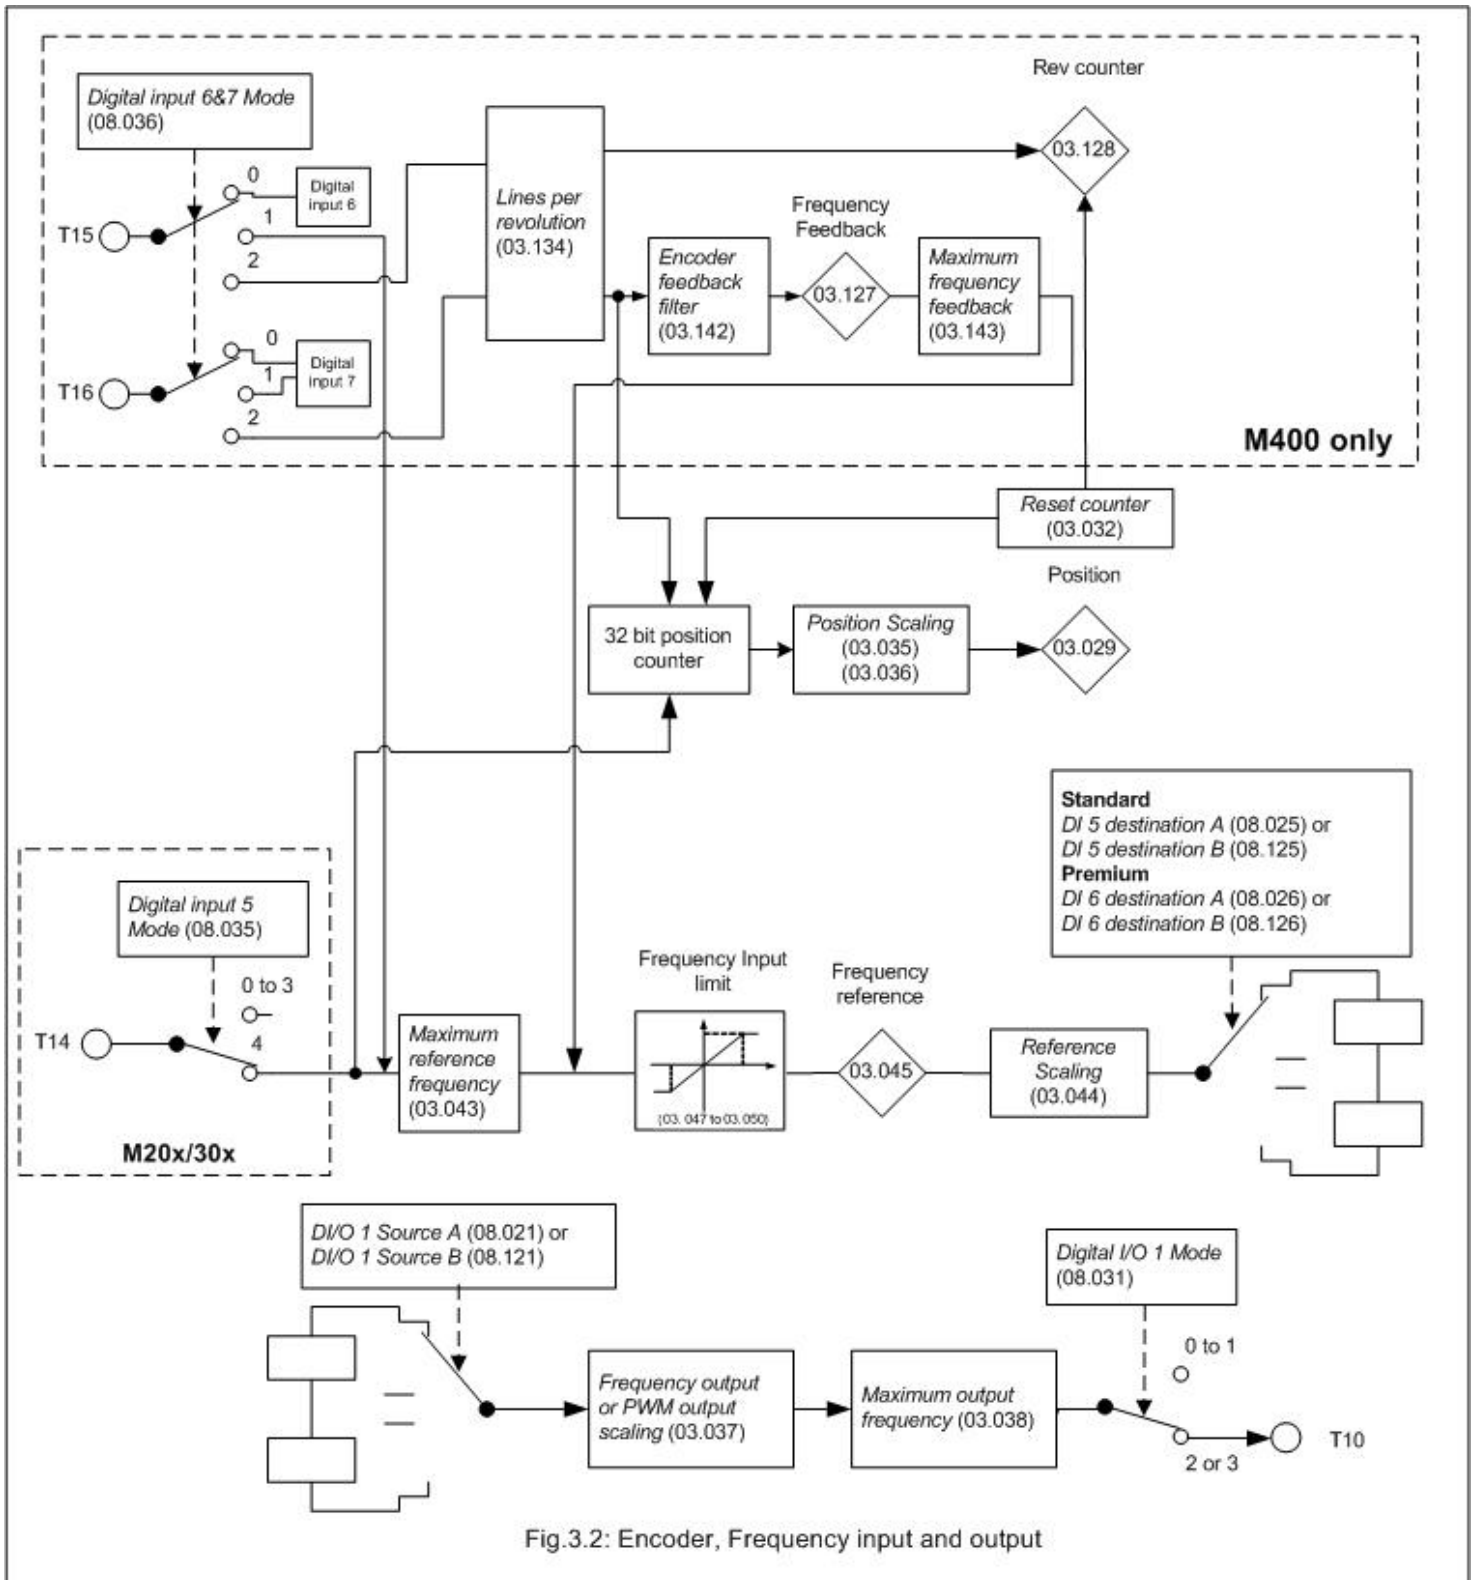

Fig.3.2: Encoder, Frequency input and output

Indicates the current value of the position counter in Frequency or Encoder mode. Position is reset to 0 if *Position Counter Reset* (03.032) is 1.

Parameter	03.032 <i>Position Counter Reset</i>		
Short description	Set to 1 to reset the position counter		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

When set, this parameter resets the position parameter (*Position* (03.029)) and revolution counter *Revolution Counter* (03.128) to 0.

Parameter	03.035 Position Scaling Numerator		
Short description	Defines the numerator used for scaling the pulse counter		
Mode	RFC-A		
Minimum	0.000	Maximum	1.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	3
Coding	RW, BU		

Position Scaling Numerator (03.035) and *Position Scaling Denominator* (03.036) are used to scale the pulse counter down to the required position units. The multiplying factor applied to the counter is defined as:

$$\text{Position Scaling Numerator (03.035)} \div \text{Position Scaling Denominator (03.036)}$$

Parameter	03.036 Position Scaling Denominator		
Short description	Defines the denominator used for scaling the pulse counter		
Mode	RFC-A		
Minimum	0.000	Maximum	100.000
Default	1.000	Units	
Type	32 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Position Scaling Numerator* (03.035).

Parameter	03.037 Frequency Output or PWM Output Scaling		
Short description	Defines the scaling factor applied to the frequency or PWM output		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	3
Coding	RW, BU		

Scale factor applied to the frequency or PWM output.

Parameter	03.038 Maximum Output Frequency		
Short description	Defines the maximum frequency required at the frequency output		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	2	Units	kHz
Type	8 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, TE, BU		

Value	Text	Description
0	1	15.1 bit resolution at Fmax
1	2	14.1 bit resolution at Fmax
2	5	12.8 bit resolution at Fmax
3	10	11.8 bit resolution at Fmax

Defines the maximum frequency required at the frequency output. The choice of maximum output frequency depends on the requirement of the output. Due to limitations in the hardware, higher output frequencies do not offer the best resolution at the top end of the frequency range. 1, 2, 5, and 10kHz (0 - 3).

Fmax (kHz)	Resolution at Fmax
1	10 bit
2	9
5	8
10	7.7

Parameter	03.042 Frequency Input High Precision		
Short description	Increase the frequency input measuring window		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Frequency Input High Precision* (03.042) = 1 then the frequency input measurement window is doubled. This doubles the accuracy of the frequency input measurement but increase the response time by two.

If *Frequency Input High Precision* (03.042) = 0 then the frequency input measurement window is similar to Commander SK with better response time.

Parameter	03.043 <i>Maximum Reference Frequency</i>		
Short description	Defines the maximum frequency expected at the frequency input		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	10.00	Units	kHz
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	2
Coding	RW		

Defines the maximum frequency expected at the frequency input. The time the frequency is measured over is defined by

Measurement Time = 2048 / Maximum reference frequency

With a maximum measurement time of 0.341 seconds.

2048 is used to give the measurement more stability. The output is 10 bits.

Maximum reference frequency of less than 6kHz will have a lower resolution.

Parameter	03.044 <i>Frequency Reference Scaling</i>		
Short description	Defines the scaling factor applied to the frequency reference		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	3
Coding	RW, BU		

Scale factor applied to the frequency reference.

Parameter	03.045 <i>Frequency Reference</i>		
Short description	Displays the frequency reference		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, ND, NC, PT		

Indicates the reference input:

Digital input 6/7 mode (08.036) = 1 this is the reference from the frequency input.

Digital input 6/7 mode (08.036) = 2 this is the reference from the encoder AB input.

The reference has a 16ms filter.

Parameter	03.047 <i>Two Point Minimum Frequency</i>		
Short description	Defines the minimum frequency for scaling the frequency input		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

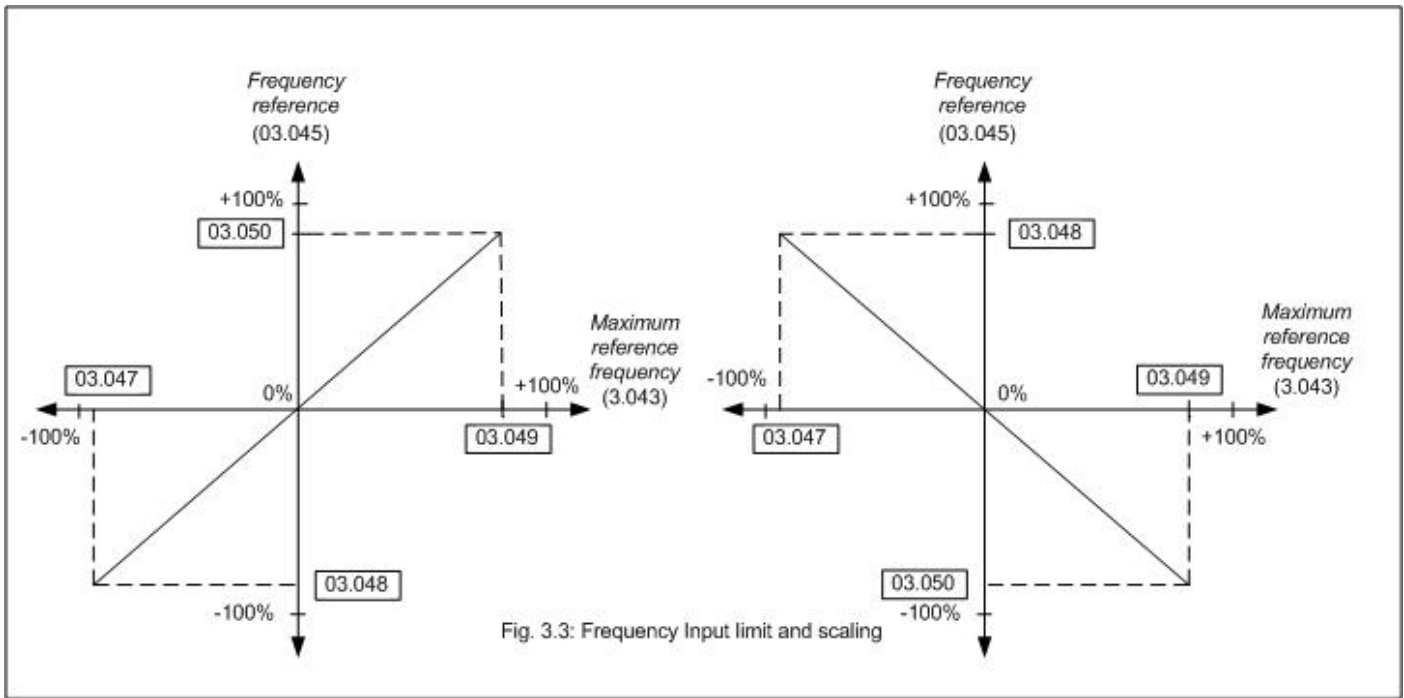

Fig. 3.3: Frequency Input limit and scaling

Frequency Reference (03.045) is scaled and limited using:

- Two Point Minimum Frequency (03.047)
- Drive Reference at Minimum Frequency (03.048)
- Two Point Maximum Frequency (03.049)
- Drive Reference at Maximum Frequency (03.050)

Parameters above can be selected to limit the range of Frequency Reference (03.045) and also scale it between the minimum and maximum reference.

Parameter	03.048 Drive Reference at Minimum Frequency		
Short description	Defines the drive reference for scaling the frequency input at minimum frequency		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See Two Point Minimum Frequency (03.047).

Parameter	03.049 Two Point Maximum Frequency		
Short description	Defines the maximum frequency for scaling the frequency input		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See Two Point Minimum Frequency (03.047).

Parameter	03.050 Drive Reference at Maximum Frequency		
Short description	Defines the drive reference for scaling the frequency input at maximum frequency		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See Two Point Minimum Frequency (03.047).

Parameter	03.072 Motor speed percent		
Short description	Displays the final demand reference as a percentage of the reference clamp		
Mode	RFC-A		
Minimum	-150.0	Maximum	150.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, ND, NC, PT		

Motor speed percent (03.072) displays the *Final Demand Reference* (03.001) as a percentage of the reference clamp.

If *Final Demand Reference* (03.001) >= 0.00Hz then

If *Maximum Reference Clamp* (01.006) = 0.00Hz then

Motor speed percent (03.072) = 0.0%

else

Motor speed percent (03.072) = *Final Demand Reference* (03.001) x 100 / *Maximum Reference Clamp* (01.006)

else

If *Negative Reference Clamp Enable* (01.008) = 1 then

If *Maximum Reference Clamp* (01.006) = 0.00Hz then

Motor speed percent (03.072) = 0.0%

else

Motor speed percent (03.072) = -*Final Demand Reference* (03.001) x 100 / *Minimum Reference Clamp* (01.007)

else

If *Maximum Reference Clamp* (01.006) = 0.00Hz then

Motor speed percent (03.072) = 0.0%

else

Motor speed percent (03.072) = -*Final Demand Reference* (03.001) x 100 / (-*Maximum Reference Clamp* (01.006))

Parameter	03.079 Sensorless Mode Filter		
Short description	Defines the time constant for the filter applied to the output of the frequency estimator system		
Mode	RFC-A		
Minimum	0	Maximum	5
Default	0	Units	ms
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	4
1	5
2	6
3	8
4	12
5	20

A filter with a 4ms time constant is always applied to the output of the frequency estimator system used for sensorless operation in closed loop mode. This time constant may be extended by increasing *Sensorless Mode Filter* (03.079) above 0. The output of the frequency estimator can include some ripple, which increases as the drive passes into field weakening and the filter can be used to remove this ripple. This is particularly useful when using standard ramp or spinning start with a low friction high inertia load, and can prevent over voltage trips when the drive has no braking resistor.

Parameter	03.080 Sensorless Position		
Short description	Displays the motor position representing a movement equivalent to one pole of the motor		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Sensorless Position (03.080) gives the motor position representing a movement equivalent to one pole of the motor.

For example in a rotary application with a 4 pole motor, the movement associated with one pole is a mechanical movement of 180°. *Sensorless Position* (03.080) is aligned as for a position feedback device with 0° phasing angle.

Parameter	03.127 Frequency feedback		
Short description	Frequency feedback from encoder		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, VM, ND, NC, PT		

Frequency feedback (03.127) shows the frequency derived from the encoder feedback if *Digital input 6/7 mode* (08.036) = 2. The value shown is measured over a 16ms sliding window period and will depend on *Rotary Lines Per Revolution* (03.134).

Parameter	03.128 Revolution Counter		
Short description	Displays the revolution counter when in encoder mode		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	Revs
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RO, FI, ND, NC, PT, BU		

Encoder revolution counter from 0 to 65535. If *Digital input 6/7 mode* (08.036) is 2 in Encoder mode, read 0 otherwise.

Counter is reset to 0 if *Position Counter Reset* (03.032) is 1.

Parameter	03.134 Rotary Lines Per Revolution		
Short description	Defines the number of rotary lines per revolution for the encoder connected		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	512
1	1024
2	2048
3	4096

Rotary Lines Per Revolution (03.134) should be set to the number of lines per revolution for the encoder connected to the Di6 and Di7 inputs.

Parameter	03.142 Encoder feedback filter		
Short description	Defines the time period for a sliding window filter that may be applied to the feedback taken from the drive encoder feedback interface		
Mode	RFC-A		
Minimum	1	Maximum	31
Default	3	Units	ms
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Encoder feedback filter (03.142) defines the time period for a sliding window filter that may be applied to the feedback taken from the drive encoder feedback interface. This is a multiple of 16ms window. The encoder is sampled every 16ms and therefore if *Encoder feedback filter* (03.142) = 1 the filter is disabled.

Parameter	03.143 Maximum Frequency Feedback		
Short description	Defines the maximum frequency expected at the frequency encoder feedback		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default	See exceptions below	Units	Hz
Type	32 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

Region	Default Value
50Hz	50.00
60Hz	60.00

Defines the maximum frequency feedback expected in *Frequency feedback* (03.127)

Menu 4 – Torque and Current control

Mode: RFC-A

Common Features

Open loop current control

Fig.4.6: Open-loop mode

In open loop mode it is possible to control the motor frequency or the motor torque. When the frequency of the motor is controlled (*Torque Mode Selector* (04.011) = 0) the *Post Ramp Reference* (02.001) is defined by the ramp system unless the current limits are active. The *Post Ramp Reference* (02.001) can directly define the output frequency of the drive or this can be modified to compensate for motor slip. If the current limits are active (*Current Limit Active* (10.009) = 1) the ramp system remains active, but the output of the current controller is added to the ramp output so that the frequency applied to the motor is modified to try and reduce the torque producing current in the motor. For example, if the *Post Ramp Reference* (02.001) is positive (i.e. motor is running forwards) and the motor is overloaded with a motoring load a positive *Torque Producing Current* (04.002) is generated that will exceed the *Final Current Limit* (04.018). This gives a negative error which attempts to reduce the ramp output causing the motor to slow down.

When motor torque is being controlled (*Torque Mode Selector* (04.011) = 1) The *Final Torque Reference* (04.003) is converted to a current reference and the current limits are applied giving the *Final Current Reference* (04.004). This is used as the reference input to the PI controller that regulates the torque producing current in the motor. The output of the PI controller is the *Post Ramp Reference* (02.001), and so the torque is controlled by increasing or decreasing the motor frequency. This system gives only moderate dynamic performance. For better torque control in a system without position feedback, closed loop current control should be used.

It is possible to disable the flux compensation by setting *Flux Control Compensation Disable* (05.028) to 1. This is only normally required to prevent motor instability when an inaccurate value for *Motor Rated Speed* (05.008) is being used in RFC-A mode.

Current Controller Kp Gain (04.013) and *Current Controller Ki Gain* (04.014) are the proportional and integral gains of the current controller. As already mentioned the current controller either provides current limits or closed-loop torque control by modifying the *Post Ramp Reference* (02.001). The control loop is also used in its torque mode during supply loss, or when the controlled mode standard ramp is active and the drive is decelerating, to regulate

the flow of current into the drive. Although the default settings have been chosen to give suitable gains for less demanding applications it may be necessary for the user to adjust the performance of the controller. The following is a guide to setting the gains for different applications.

Current limit operation

The current limits will normally operate with an integral term only, particularly below the point where field weakening begins. The proportional term is inherent in the loop. The integral term must be increased enough to counter the effect of the ramp which is still active even in current limit. For example, if the drive is operating at constant frequency and is overloaded the current limit system will try to reduce the output frequency to reduce the load. At the same time the ramp will try to increase the frequency back up to the demand level. If the integral gain is increased too far the first signs of instability will occur when operating around the point where field weakening begins. These oscillations can be reduced by increasing the proportional gain. A system has been included to prevent regulation because of the opposite actions of the ramps and the current limit. This can reduce the actual level that the current limit becomes active by 12.5%. This still allows the current to increase up to the current limit set by the user.

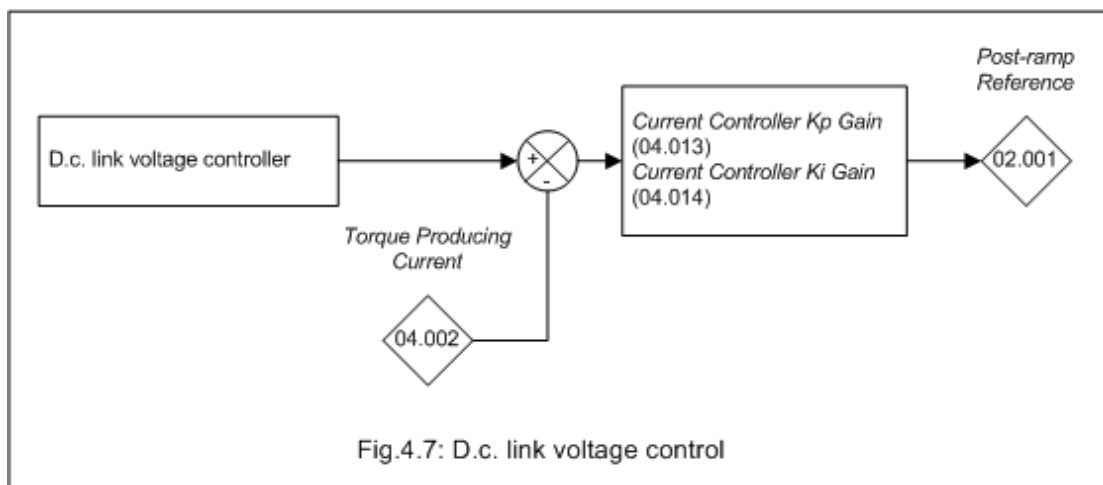

However the current limit flag (*Current Limit Active* (10.009)) could become active up to 12.5% below the current limit depending on the ramp rate used.

Torque control

Again the controller will normally operate with an integral term only, particularly below the point where field weakening begins. The first signs of instability will appear around rated frequency, and can be reduced by increasing the proportional gain. The controller can be less stable in torque control mode compared to when it is used for current limiting. This is because load helps to stabilise the controller, and under torque control the drive may operate with light load. Under current limit the drive is often under heavy load unless the current limits are set at a low level.

Supply loss and standard ramp

The d.c. link voltage controller becomes active if supply loss detection is enabled and the drive supply is lost or standard ramp is being used (*Ramp Mode Select* (02.004) > 0) and the motor is regenerating. The d.c. link controller attempts to hold the d.c. link voltage at a fixed level by controlling the flow of current from the drive inverter into its d.c. link capacitors. The system is forced into current control mode and the output of the d.c. voltage controller is fed into the current controller as shown below.

Although it is not usually necessary, the d.c. link voltage controller gain can be adjusted with the *Voltage Controller Gain* (05.031). However, it may be necessary to adjust the current controller gains to obtain the required performance. If the gains are not suitable it is best to set up the drive in torque control first. Set the gains to a value that does not cause instability around the point at which field weakening occurs. Then revert back to open loop frequency control in standard ramp mode. To test the controller the supply should be removed whilst the motor is running. It is likely that the gains can be increased further if required because the d.c. link voltage controller has a stabilising effect, provided that the drive is not required to operate in torque control mode.

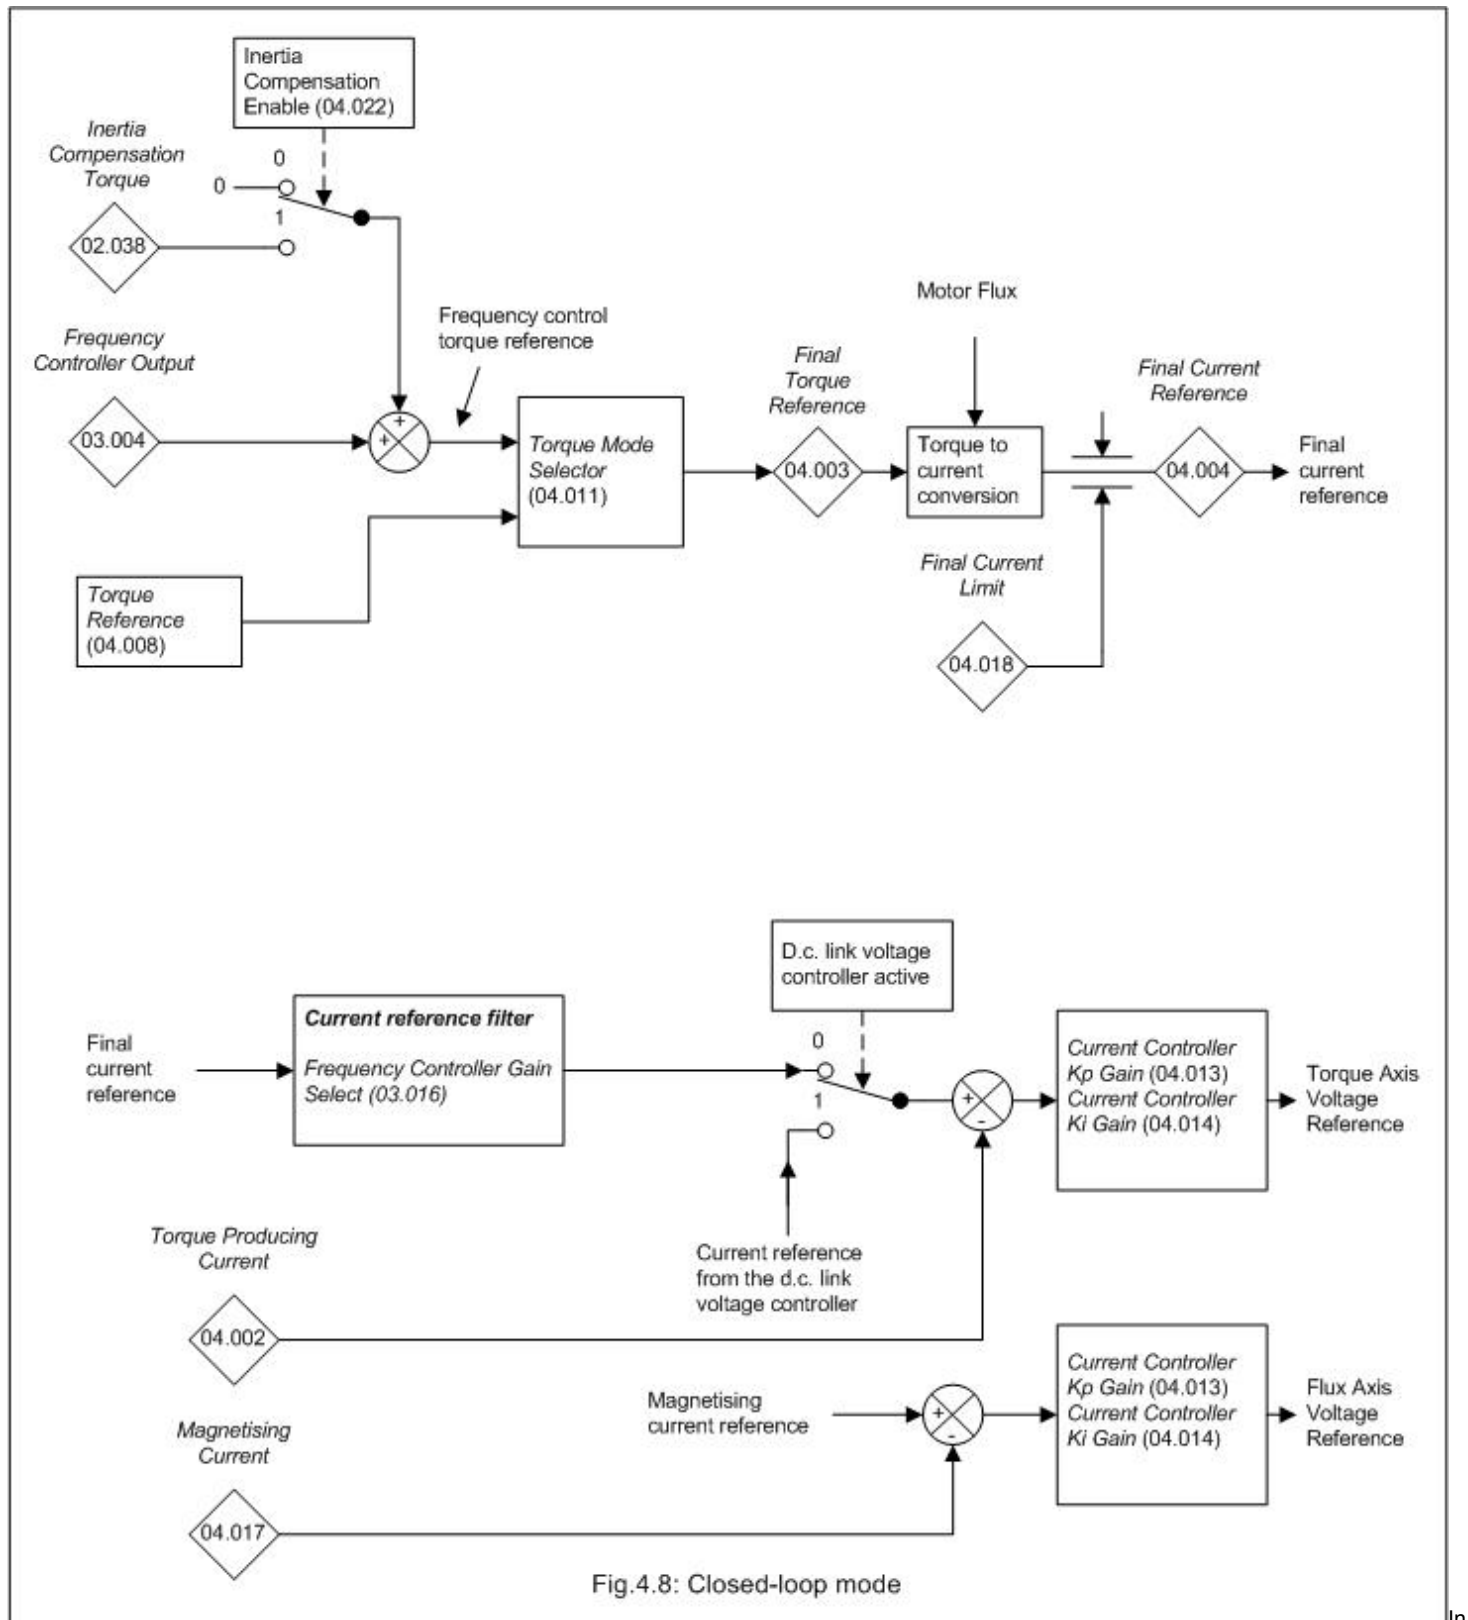

Fig.4.8: Closed-loop mode

RFC modes, closed-loop current control is provided for the torque and flux producing currents. The torque reference is normally provided by the frequency controller, or from the torque reference, or as a combination of both depending on the value of the *Torque Mode Selector* (04.011). During supply loss or when standard ramp mode is selected and the motor is regenerating it is possible that the torque producing current reference may be provided by the d.c. link voltage controller as shown above.

Current Controller Kp Gain (04.013) and *Current Controller Ki Gain* (04.014) are the proportional and integral gains of the current controllers. It should be noted that when an auto-tune is performed that measures the *Transient Inductance* (05.024) and *Stator Resistance* (05.017) the *Current Controller Kp Gain* (04.013) and *Current Controller Ki Gain* (04.014) are automatically set to the levels defined in the description. These represent the maximum levels that are likely to be used with this mode in most applications.

The current controller gains can either be set using auto-tuning (see *Auto-tune* (05.012)) or the values can be set up manually by the user. The calculations given below are those used by the auto-tuning system and should give good performance without excessive overshoot.

The proportional gain, *Current Controller Kp Gain* (04.013), is the most critical value in controlling the performance of the current controllers. The required value can be calculated as

$$\text{Current Controller Kp Gain (04.013)} = (L / T) \times (I_{fs} / V_{fs}) \times (256 / 37.5)$$

where

T is the sample time of the current controllers. The drive compensates for any change of sample time, and so it should be assumed that the sample time is equivalent to the base value of 167µs.

L is the motor inductance. For a permanent magnet motor this is half the phase to phase inductance that is normally specified by the manufacturer. For an induction motor this is the per phase transient inductance (sLs). The inductance for either of these motors can be taken from the manufacturer's data or it can be obtained from the value stored in the *Transient Inductance (05.024)* after auto-tuning.

I_{fs} is the peak full scale current feedback, i.e. full scale current $\times \sqrt{2}$. The r.m.s. full scale current is given by *Full Scale Current Kc (11.061)*, and so $I_{fs} = \text{Full Scale Current Kc (11.061)} \times \sqrt{2}$.

V_{fs} is the maximum d.c. link voltage.

Therefore

$$\text{Current Controller Kp Gain (04.013)} = (L / 167\mu\text{s}) \times (Kc \times \sqrt{2} / V_{fs}) \times (256 / 37.5)$$

$$= K \times L \times Kc$$

where

$$K = [\sqrt{2} / (V_{fs} \times 167\mu\text{s})] \times (256 / 37.5)$$

There is one value of the scaling factor K for each drive voltage rating as shown in the table below.

Drive Rated Voltage (11.033)	V_{fs}	K
200V	415V	1045
400V	830V	522
575V	990V	438

The integral gain, *Current Controller Ki Gain (04.014)*, is less critical. A suggested value which matches the zero with the pole caused by the electrical time constant of the motor and ensures that the integral term does not contribute to current overshoot is given by

$$\text{Current Controller Ki Gain (04.014)} = \text{Current Controller Kp Gain (04.013)} \times 5 \times T / t_m$$

Where t_m is the motor time constant (L / R). R is the per phase stator resistance of the motor (i.e. half the resistance measured between two phases).

Therefore

$$\text{Current Controller Ki Gain (04.014)} = (K \times L \times Kc) \times 5 \times 167\mu\text{s} \times R / L$$

$$= 0.0427 \times K \times R \times Kc$$

The above equations give the gain values that should give a good response with minimal overshoot. If required the gains can be adjusted to modify the performance as follows:

1. *Current Controller Ki Gain (04.014)* can be increased to improve the performance of the current controllers by reducing the effects of inverter non-linearity. These effects become more significant with higher switching frequency. These effects will be more significant for drives with higher current ratings and higher voltage ratings. If *Current Controller Ki Gain (04.014)* is increased by a factor of 4 it is possible to get up to 10% overshoot in response to a step change of current reference. For high performance applications, it is recommended that *Current Controller Ki Gain (04.014)* is increased by a factor of 4 from the auto-tuned values. As the inverter non-linearity is worse with higher switching frequencies it may be necessary to increase *Current Controller Ki Gain (04.014)* by a factor of 8 for operation with 16kHz switching frequency.
2. It is possible to increase *Current Controller Ki Gain (04.014)* to reduce the response time of the current controllers. If *Current Controller Kp Gain (04.013)* is increased by a factor of 1.5 then the response to a step change of reference will give 12.5% overshoot. It is recommended that *Current Controller Ki Gain (04.014)* is increased in preference to *Current Controller Kp Gain (04.013)*.

As already stated, the drive compensates for changes of switching frequency and the sampling method used by the controller. The table below shows the adjustment applied to the proportional and integral gains.

Switching Frequency (05.037)	Current controller sample time	Current Controller Kp Gain (04.013) adjustment	Current Controller Ki Gain (04.014) adjustment
0.667kHz	750µs	x 167 / 750 = 0.2	x 1.0
1kHz	500µs	x 167 / 500 = 0.3	x 1.0
2kHz	500µs	x 167 / 500 = 0.3	x 1.0
3kHz	333µs	x 167 / 333 = 0.5	x 1.0
4kHz	250µs	x 167 / 250 = 0.7	x 1.0
6kHz	167µs	x 167 / 167 = 1.0	x 1.0
8kHz	125µs	x 167 / 125 = 1.3	x 1.0
12kHz	167µs	x 167 / 167 = 1.0	x 1.0
16kHz	125µs	x 167 / 125 = 1.3	x 1.0

Note: 0.667kHz and 1kHz switching frequencies are not supported on standard drives or by large drive pods.

Parameter	04.001 <i>Current Magnitude</i>		
Short description	Shows the instantaneous drive output current		
Mode	RFC-A		
Minimum	-VM_DRIVE_CURRENT	Maximum	VM_DRIVE_CURRENT
Default		Units	A
Type	32 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, VM, ND, NC, PT		

Current Magnitude (04.001) is the instantaneous drive output current scaled so that it represents the r.m.s. phase current in Amps under steady state conditions.

Parameter	04.002 <i>Torque Producing Current</i>		
Short description	Shows the instantaneous level of torque producing current		
Mode	RFC-A		
Minimum	-VM_DRIVE_CURRENT	Maximum	VM_DRIVE_CURRENT
Default		Units	A
Type	32 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, VM, ND, NC, PT		

Torque Producing Current (04.002) is the instantaneous level of torque producing current scaled so that it represents the r.m.s. level of torque producing current under steady state conditions. *Torque Producing Current* (04.002) is proportional to the torque produced by the motor provided field weakening is not active. For field weakening operation the *Torque Producing Current* (04.002) is boosted for a given level of torque to compensate for the reduction in the motor flux. The sign of *Torque Producing Current* (04.002) is defined in the table below.

Sign of <i>Torque Producing Current</i> (04.002)	Sign of frequency	Direction of motor torque
+	+	Accelerating
-	+	Decelerating
+	-	Decelerating
-	-	Accelerating

Parameter	04.003 <i>Final Torque Reference</i>		
Short description	Shows the final torque reference		
Mode	RFC-A		
Minimum	-VM_TORQUE_CURRENT	Maximum	VM_TORQUE_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

The *Frequency Controller Output* (03.004) can include a feed forward torque that will provide the torque necessary to accelerate the load inertia. This can be combined with the *Final Torque Reference* (04.003) as defined by the *Torque Mode Selector* (04.011) to give the *Final Torque Reference* (04.003) as a percentage of the rated torque for the motor.

Parameter	04.004 <i>Final Current Reference</i>		
Short description	Shows the final current reference after the current limits		
Mode	RFC-A		
Minimum	-VM_TORQUE_CURRENT	Maximum	VM_TORQUE_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

The *Final Torque Reference* (04.003) is converted into the *Final Current Reference* (04.004) by applying a torque to current conversion and by applying the *Final Current Limit* (04.018). The torque to current conversion is applied as follows:

$$\text{Current reference} = \text{Final Torque Reference (04.003)} \times \text{Motor Rated Flux} / \text{Motor Flux}$$

It is possible to disable the flux compensation by setting *Flux Control Compensation Disable* (05.028) to 1. This is only normally required to prevent motor instability when an inaccurate value for *Motor Rated Speed* (05.008) is being used in RFC-A mode.

Parameter	04.005 Motoring Current Limit		
Short description	Defines the current limit used when the motor is being accelerated away from standstill		
Mode	RFC-A		
Minimum	-VM_MOTOR1_CURRENT_LIMIT	Maximum	VM_MOTOR1_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

The *Motoring Current Limit* (04.005) limits the current when the motor is being accelerated away from standstill. The *Regenerating Current Limit* (04.006) limits the current when the motor is being decelerated towards standstill. If the *Symmetrical Current Limit* (04.007) is below the *Motoring Current Limit* (04.005) then it is used instead of the *Motoring Current Limit* (04.005). If the *Symmetrical Current Limit* (04.007) is below the *Regenerating Current Limit* (04.006) then it is used instead of the *Regenerating Current Limit* (04.006).

The maximum possible current limit (VM_MOTOR1_CURRENT_LIMIT [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.

Parameter	04.006 Regenerating Current Limit		
Short description	Defines the current limit used when the motor is being decelerated towards standstill		
Mode	RFC-A		
Minimum	-VM_MOTOR1_CURRENT_LIMIT	Maximum	VM_MOTOR1_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

See *Motoring Current Limit* (04.005).

Parameter	04.007 Symmetrical Current Limit		
Short description	Defines the symmetrical current limit		
Mode	RFC-A		
Minimum	-VM_MOTOR1_CURRENT_LIMIT	Maximum	VM_MOTOR1_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

See *Motoring Current Limit* (04.005).

Parameter	04.008 Torque Reference		
Short description	Defines the torque reference		
Mode	RFC-A		
Minimum	-VM_USER_CURRENT	Maximum	VM_USER_CURRENT
Default	0.0	Units	%
Type	32 Bit User Save	Update Rate	1ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

See *Final Torque Reference* (04.003).

Parameter	04.011 Torque Mode Selector		
Short description	Defines the torque mode used by the drive		
Mode	RFC-A		
Minimum	0	Maximum	5
Default	0	Units	
Type	8 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW		

The value of the *Torque Mode Selector* (04.011) defines how the *Final Torque Reference* (04.003) is produced. If *Torque Mode Selector* (04.011) is set to 1, 2, 3 or 5 the ramps are disabled. If the *Torque Mode Selector* (04.011) is subsequently changed to 0 or 4 the ramps are enabled again. To prevent an unwanted torque transient during this changeover the *Post Ramp Reference* (02.001) is loaded with the *Estimated Frequency* (03.002) just prior to the mode change. This means that after the changeover the frequency error and hence the *Frequency Controller Output* (03.004) is zero. If *Stop Mode* (06.001) is set to 1 or 2 then ramps are enabled to stop the motor. If *Torque Mode Selector* (04.011) is set to 1, 2, 3 or 5 and *Stop Mode* (06.001) is 1 or 2 then again the *Post Ramp Reference* (02.001) is loaded with the *Estimated Frequency* (03.002) just prior to stopping the motor to prevent an unwanted torque transient. (Note that if *Hard Frequency Reference Select* (03.023) = 1, then the *Post Ramp Reference* (02.001) is loaded with *Estimated Frequency* (03.002) - *Hard Frequency Reference* (03.022) during these changeovers.)

The inputs to the torque mode selector system are referred to below as the Frequency control torque reference and the User torque reference. The Frequency control torque reference is the *Frequency Controller Output* (03.004) combined with the Feed Forward if this is enabled.

0: Frequency control mode

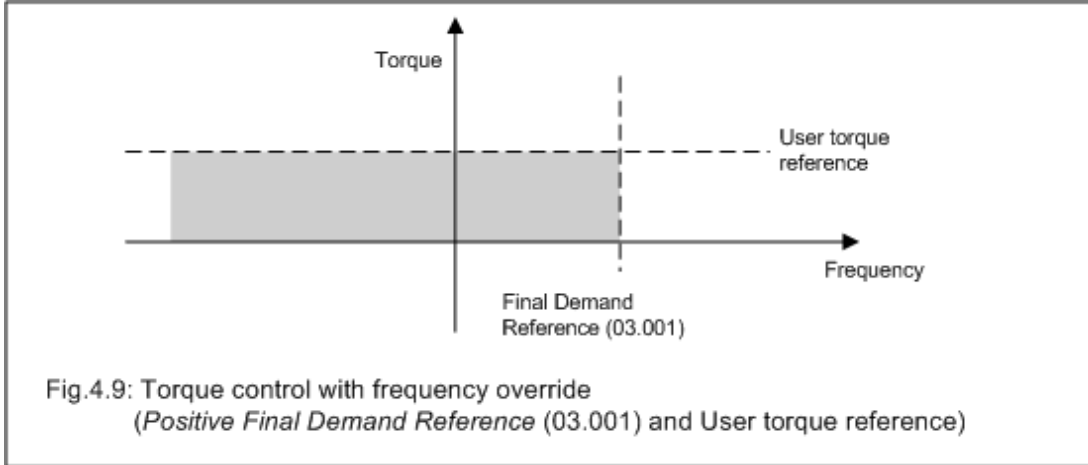

The *Final Torque Reference* (04.003) is the Frequency controller torque reference.

1: Torque control

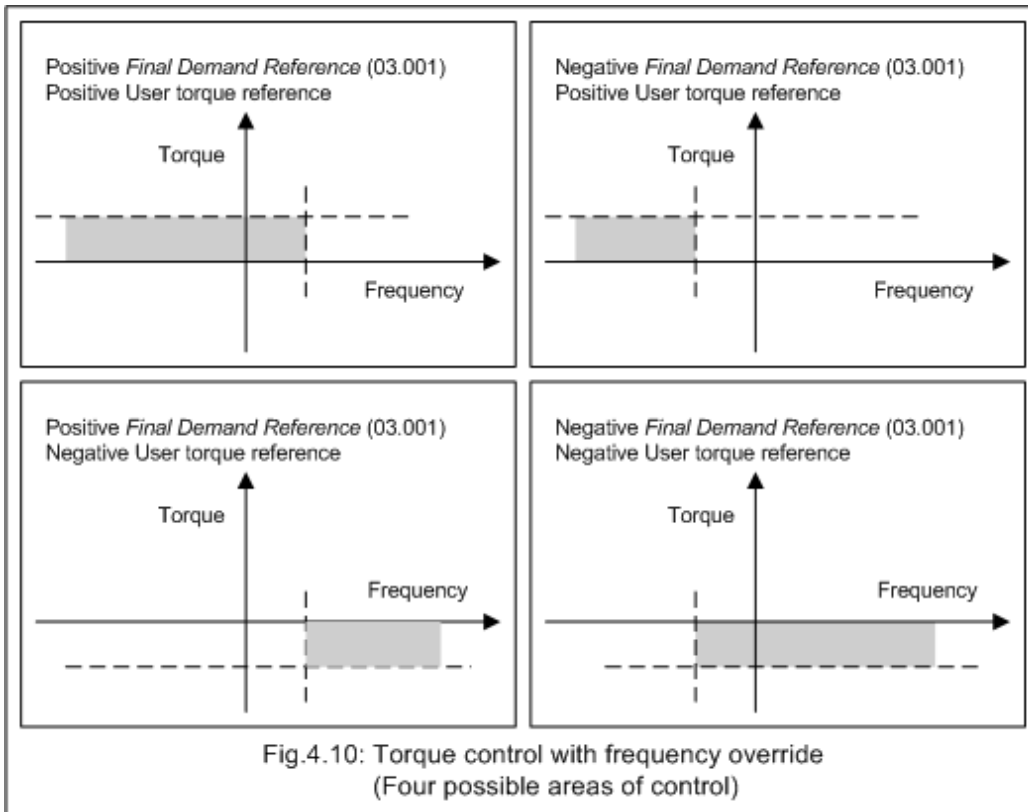

The *Final Torque Reference* (04.003) is the User torque reference. The frequency is not limited by the drive but, the drive will trip at the over-frequency threshold if runaway occurs.

2: Torque control with frequency override

The *Final Torque Reference* (04.003) is the Frequency controller torque reference, but this reference is limited between 0 and the User torque reference. The effect is to produce an operating area as shown below if the Frequency controller torque reference and the User torque reference are both positive. The frequency controller will attempt to accelerate the motor to the *Final Demand Reference* (03.001) with a torque equivalent to the User torque reference. However, the frequency cannot be forced above the *Final Demand Reference* (03.001) by the drive because the required torque would be negative, and so it would be clamped to zero.

Depending on the sign of the *Final Demand Reference* (03.001) and the User torque reference there are four possible areas of operation as shown below.

3: Coiler/uncoiler mode

Positive Final Demand Reference (03.001): Positive User torque reference gives torque control with a positive frequency limit defined by the *Final Demand Reference* (03.001). A negative User torque reference gives torque control with a negative frequency limit of -0.2Hz.

Negative Final Demand Reference (03.001): Negative User torque reference gives torque control with a negative frequency limit defined by the *Final Demand Reference* (03.001). A positive User torque reference gives torque control with a negative frequency limit of + 0.2Hz.

Example of coiler operation:

This is an example of a coiler operating in the positive direction. The *Final Demand Reference* (03.001) is set to a positive value just above the coiler reference frequency. If the User torque reference is positive the coiler operates with a limited frequency, so that if the material breaks the frequency does not exceed a level just above the reference. It is also possible to decelerate the coiler with a negative User torque reference. The coiler will decelerate down to - 0.2Hz until a stop is applied. The operating area is shown below:

Example of uncoiler operation:

This is an example for an uncoiler operating in the positive direction. The *Final Demand Reference* (03.001) should be set to a level just above the maximum normal frequency. When the User torque reference is negative the uncoiler will apply tension and try and rotate at 0.2Hz in reverse, and so take up any slack. The uncoiler can operate at any positive frequency applying tension. If it is necessary to accelerate the uncoiler a positive User torque reference is used. The frequency will be limited to the *Final Demand Reference* (03.001). The operating area is the same as that for the coiler and is shown below:

4: Frequency control with torque feed-forward

The Frequency control torque reference and User torque reference are summed so that the drive operates under frequency control, but a torque value may be added to the output of the frequency controller. This can be used to improve the regulation of systems where the frequency controller gains need to be low for stability.

5: Bi-directional torque control with frequency override

This mode is similar to coiler/uncoiler mode except that the modulus of the *Final Demand Reference* (03.001) is used in each direction to give an operating area as shown below.

Parameter	04.013 Current Controller Kp Gain		
Short description	Defines the current loop controller proportional gain		
Mode	RFC-A		
Minimum	0.00	Maximum	4000.00
Default	20.00	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

Current Controller Kp Gain (04.013) and *Current Controller Ki Gain* (04.014) are the proportional and integral gains of the current controller.

Refer to *Torque and Current control*.

Parameter	04.014 Current Controller Ki Gain		
Short description	Defines the current loop controller integral gain		
Mode	RFC-A		
Minimum	0.000	Maximum	600.000
Default	40.000	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Current Controller Kp Gain* (04.013).

Parameter	04.015 Motor Thermal Time Constant 1		
Short description	Set to the thermal time constant for the motor		
Mode	RFC-A		
Minimum	1	Maximum	3000
Default	179	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

A single time constant thermal model is provided that can be used to estimate the motor temperature as a percentage of its maximum allowed temperature. The input to the model is the *Current Magnitude* (04.001). Throughout the following discussion *Motor Rated Current* (05.007) is used in the model assuming *Select Motor 2 Parameters* (11.045) = 0. If *Select Motor 2 Parameters* (11.045) = 1 then *M2 Motor Rated Current* (21.007) is used instead.

Percentage Losses

The losses in the motor are calculated as a percentage value, so that under these conditions the *Motor Protection Accumulator* (04.019) would eventually reach 100%.

$$\text{Percentage Losses} = 100\% \times [\text{Load Related Losses}]$$

where

$$\text{Load Related Losses} = I / (K_1 \times I_{\text{Rated}})^2$$

where

I = *Current Magnitude* (04.001)

I_{Rated} = *Motor Rated Current* (05.007)

The value of K_1 defines the continuous allowable motor overload as a proportion of the *Motor Rated Current* (05.007) before the *Motor Protection Accumulator* (04.019) reaches 100%. The value of K_1 can be used to model reduced cooling at low frequencies and to allow the motor to operate under rated conditions with a small margin to prevent spurious trips. K_1 is defined in more detail later.

Motor Protection Accumulator

So far the steady state motor losses have been defined, but the motor model must estimate the temperature within the motor under dynamically changing conditions, and so the *Motor Protection Accumulator* (04.019) is given by the following equation.

$$T = \text{Percentage Losses} \times (1 - e^{-t/\tau_1})$$

where

T = *Motor Protection Accumulator* (04.019)

τ_1 = *Motor Thermal Time Constant 1* (04.015)

Reduced cooling with lower frequency

If *Low Frequency Thermal Protection Mode* (04.025) = 0 the characteristic is intended for a motor which can operate at rated current over the whole frequency range. Induction motors with this type of characteristic normally have forced cooling. If *Low Frequency Thermal Protection Mode* (04.025) = 1 the characteristic is intended for motors where the cooling effect of motor fan reduces with reduced motor frequency below half of rated frequency. The maximum value for K_1 is 1.05, so that above the knee of the characteristics the motor can operate continuously up to 105% of rated current.

If Motor Rated Current (05.007) $>$ Maximum Heavy Duty Rating (11.032) then K_1 is defined as shown below. Two different characteristics are provided, but in both cases the motor performance is limited at lower frequencies and the permissible overload is reduced from 105% to 101%.

Time for Motor Protection Accumulator to reach 100%

The time for the Motor Protection Accumulator (04.019) to change from its initial value to 100% is given by the following equation:

$$\text{Time to reach 100.0\%} = -\tau_1 \times \ln[(1 - C_1) / (C_0 - C_1)]$$

C_0 represents the conditions that have persisted for long enough for the Motor Protection Accumulator (04.019) to reach a steady state value. If the motor current and frequency are I_0 and w_0 then

$$C_0 = [(1 - K_{fe}) \times (I_0 / (K_1 \times I_{\text{Rated}}))^2] + [K_{fe} \times (w_0 / w_{\text{Rated}})]^{1.6}$$

C_1 represents the conditions that begin at the start of the time being calculated. If the motor current and frequency are by I_1 and w_1 then

$$C_1 = [(1 - K_{fe}) \times (I_1 / (K_1 \times I_{Rated}))^2] + [K_{fe} \times (w_1 / w_{Rated})^{1.6}]$$

Example 1: *Motor Thermal Time Constant 1* (04.015) = 89s, the initial current is zero, *Motor Rated Current* (05.007) \leq *Maximum Heavy Duty Rating* (11.032) and the new level of current is 1.5 x *Motor Rated Current* (05.007).

$$C_0 = 0$$

$$C_1 = [1.5 / (1.05 \times 1.0)]^2 = 2.041$$

$$\text{Time to reach 100.0\%} = -179 \times \ln(1 - 1/C_1) = -179 \times \ln(1 - (1 / 2.041)) = 120\text{s}$$

This is the default setting for Open loop and Closed Loop modes allowing an induction motor to run at 150% rated current for 120s from cold.

Motor Protection Accumulator Reset

The initial value in the *Motor Protection Accumulator* (04.019) at power-up is defined by *Motor Protection Accumulator Power-up Value* (04.036) as given in the table below.

Motor Protection Accumulator Power-up Value (04.036)	Motor Protection Accumulator (04.019) at power-up
Power Down	The value is saved at power-down and is used as the initial value at power-up
Zero	The value is set to zero
Real Time	If a real-time clock is present and if <i>Date/Time Selector</i> (06.019) is set up to select the real-time clock then the value saved at power-down is modified to include the effect of the motor thermal protection time constants over the time between power-down and power-up. This modified value is then used as the initial value at power-up. If no real time clock is present then and this option is selected then the value saved at power-down is used as the initial value.

The *Motor Protection Accumulator* (04.019) is reset under the following conditions:

1. *Motor Thermal Time Constant 1* (04.015) is set to 0.0. Note that this is not possible in the standard product as the minimum parameter value is 1.0.
2. *Select Motor 2 Parameters* (11.045) is modified.
3. *Motor Rated Current* (05.007) is modified when *Select Motor 2 Parameters* (11.045) = 0, or *M2 Motor Rated Current* (21.007) is modified when *Select Motor 2 Parameters* (11.045) = 1.

Motor Protection Accumulator Warning

If Percentage Losses > 100% then eventually the *Motor Protection Accumulator* (04.019) will reach 100% causing the drive to trip or the current limits to be reduced. If this is the case and *Motor Protection Accumulator* (04.019) > 75.00% then a *Motor Overload alarm* indication is given and *Motor Overload Alarm* (10.017) is set to one.

Parameter	04.016 Thermal Protection Mode		
Short description	Set to the require thermal protection mode		
Mode	RFC-A		
Minimum	0 (Display: 00)	Maximum	3 (Display: 11)
Default	0 (Display: 00)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW		

Thermal Protection Mode (04.016) defines the action taken by the drive when *Motor Protection Accumulator* (04.019) reaches 100% and/or the drive thermal monitoring parameters approach their trip levels. The bits in *Thermal Thermal Protection Mode* (04.016) are defined as follows:

Bit	Function
0	0 = <i>Motor Too Hot</i> trip is initiated when <i>Motor Protection Accumulator</i> (04.019) reaches 100% 1 = <i>Motor Too Hot</i> trip is disabled and current limiting on motor overload is active as described below
1	0 = Drive thermal monitoring current limiting is disabled 1 = Drive thermal monitoring current limiting is described is active

The required current limit is derived from the current limit parameters (*Motoring Current Limit* (04.005) to *Symmetrical Current Limit* (04.007) or 21.027 to 21.029) depending on the set-up and conditions. The current limit can be further limited by current limit on motor overload and/or drive temperature monitoring as shown below to give the *Final Current Limit* (04.018).

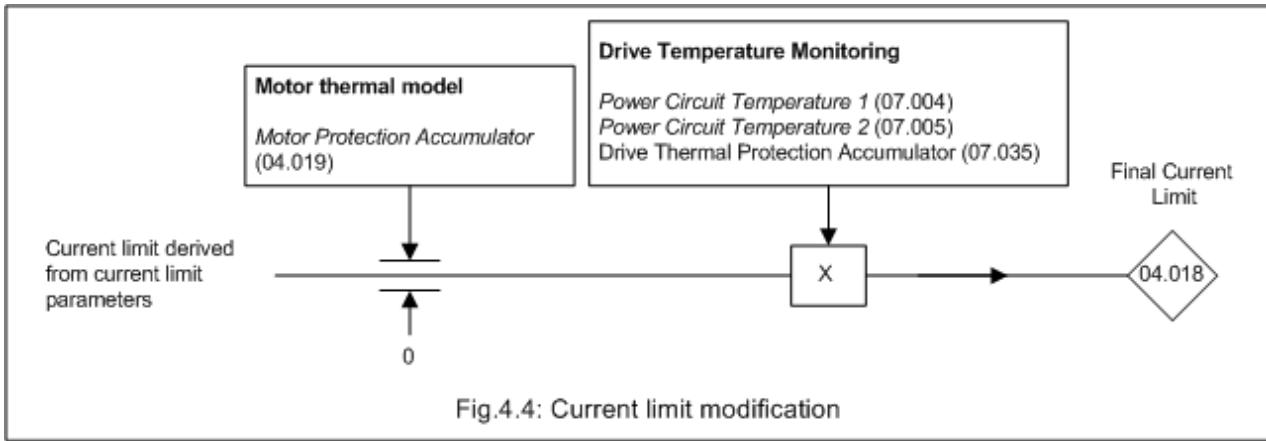

Fig.4.4: Current limit modification

Current limiting on motor overload

When the *Motor Protection Accumulator* (04.019) reaches 100.0% the current limit is limited to $(K - 0.05) \times 100.0\%$. This limitation is removed when the *Motor Protection Accumulator* (04.019) falls below 95.0%.

Drive thermal monitoring current limiting

If any of the drive temperature monitoring parameters (*Stack Temperature* (07.004) and *Auxiliary Temperature* (07.005)) are above their trip threshold minus 10°C the one that is closest to its trip threshold is used to modify the current limits as follows:

$$\text{Final Current Limit (04.018)} = \text{Current limit} \times (\text{Trip threshold} - T) / (\text{Trip threshold} - 10^\circ\text{C})$$

where T is the drive temperature monitoring parameter value.

If the *Percentage Of Drive Thermal Trip Level* (07.036) is above 90% then the final current limit is modified as follows:

$$\text{Final Current Limit (04.018)} = \text{Current limit} \times (100\% - \text{Percentage Of Drive Thermal Trip Level (07.036)}) / 10\%$$

If both of the above attempt to reduce the final current limit the lowest calculated value of current limit is used. This system has the effect of reducing the current limit to zero at the point where the drive should be tripped because its thermal monitoring has reached a trip threshold. This is intended to limit the load on the drive to prevent it from tripping when supplying a load that increases with frequency and does not include rapid transients (i.e. a fan).

Parameter	04.017 Magnetising Current		
Short description	Shows the instantaneous level of magnetising current		
Mode	RFC-A		
Minimum	-VM_DRIVE_CURRENT	Maximum	VM_DRIVE_CURRENT
Default		Units	A
Type	32 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, VM, ND, NC, PT		

Magnetising Current (04.017) is the instantaneous level of magnetising current scaled so that it represents the r.m.s. level of magnetising current under steady state conditions.

Parameter	04.018 Final Current Limit		
Short description	Shows the final current limit that is applied to the torque producing current		
Mode	RFC-A		
Minimum	-VM_TORQUE_CURRENT	Maximum	VM_TORQUE_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RO, VM, ND, NC, PT		

Final Current Limit (04.018) is the current limit level that is applied to the torque producing current. See *Thermal Protection Mode* (04.016).

Parameter	04.019 Motor Protection Accumulator		
Short description	Shows the level of the motor protection accumulator		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default		Units	%
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

See *Motor Thermal Time Constant 1* (04.015).

Parameter	04.020 <i>Percentage Load</i>		
Short description	Shows the level of torque producing current as a percentage of rated torque producing current for the motor		
Mode	RFC-A		
Minimum	-VM_USER_CURRENT	Maximum	VM_USER_CURRENT
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, VM, ND, NC, PT		

Percentage Load (04.020) gives the *Torque Producing Current* (04.002) as a percentage of the rated torque producing current for the motor. Positive values indicate motoring and negative values represent regenerating.

Parameter	04.022 <i>Inertia Compensation Enable</i>		
Short description	Set to enable inertia compensation		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Inertia Compensation Enable* (04.022) is set to one the *Inertia Compensation Torque* (02.038) is added to the output of the frequency controller. *Inertia Compensation Torque* (02.038) is calculated based on the rate of change of the frequency reference. This can be used in frequency or torque controller applications to provide the torque necessary to accelerate or decelerate the load.

Parameter	04.024 <i>User Current Maximum Scaling</i>		
Short description	Defines the maximum for the torque reference and percentage load parameters		
Mode	RFC-A		
Minimum	-VM_TORQUE_CURRENT_UNIPOLAR	Maximum	VM_TORQUE_CURRENT_UNIPOLAR
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

User Current Maximum Scaling (04.024) defines the variable maximum/minimums VM_USER_CURRENT which is applied to *Percentage Load* (04.020). This is useful when routing these parameters to an analogue output as it allows the full scale output value to be defined by the user.

The maximum value (VM_TORQUE_CURRENT_UNIPOLAR [MAX]) varies between drive sizes with default parameters loaded. For some drive sizes the default value may be reduced below the value given by the parameter range limiting.

Parameter	04.025 <i>Low Frequency Thermal Protection Mode</i>		
Short description	Set to enable low frequency thermal protection mode		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Motor Thermal Time Constant 1* (04.015).

Parameter	04.036 <i>Motor Protection Accumulator Power-up Value</i>		
Short description	Defines the initial power-up value of the motor protection accumulator		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Power down
1	Zero
2	Real time

See *Motor Thermal Time Constant 1* (04.015).

Parameter	04.041 User Over Current Trip Level		
Short description	Defines the trip level for the user over-current trip as a percentage of the drive over current trip level.		
Mode	RFC-A		
Minimum	0	Maximum	100
Default	100	Units	%
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW, RA		

The User Over-Current Trip protection level in % of *Full Scale Current Kc* (11.061) which is the full scale current in r.m.s. Amps. The User Over-Current Trip may be used to limit the output current of the drive when supplying a motor with a lower current rating than the drive. If the value of *User Over Current Trip Level* (04.041) is set at 100%, the user over-current trip is disabled.

Menu 5 – Motor Control

Mode: RFC-A

The drive can operate under Open Loop and RFC modes with respect to frequency and current control and can drive asynchronous machines. The open loop asynchronous control is further broken down into vector and fixed boost modes.

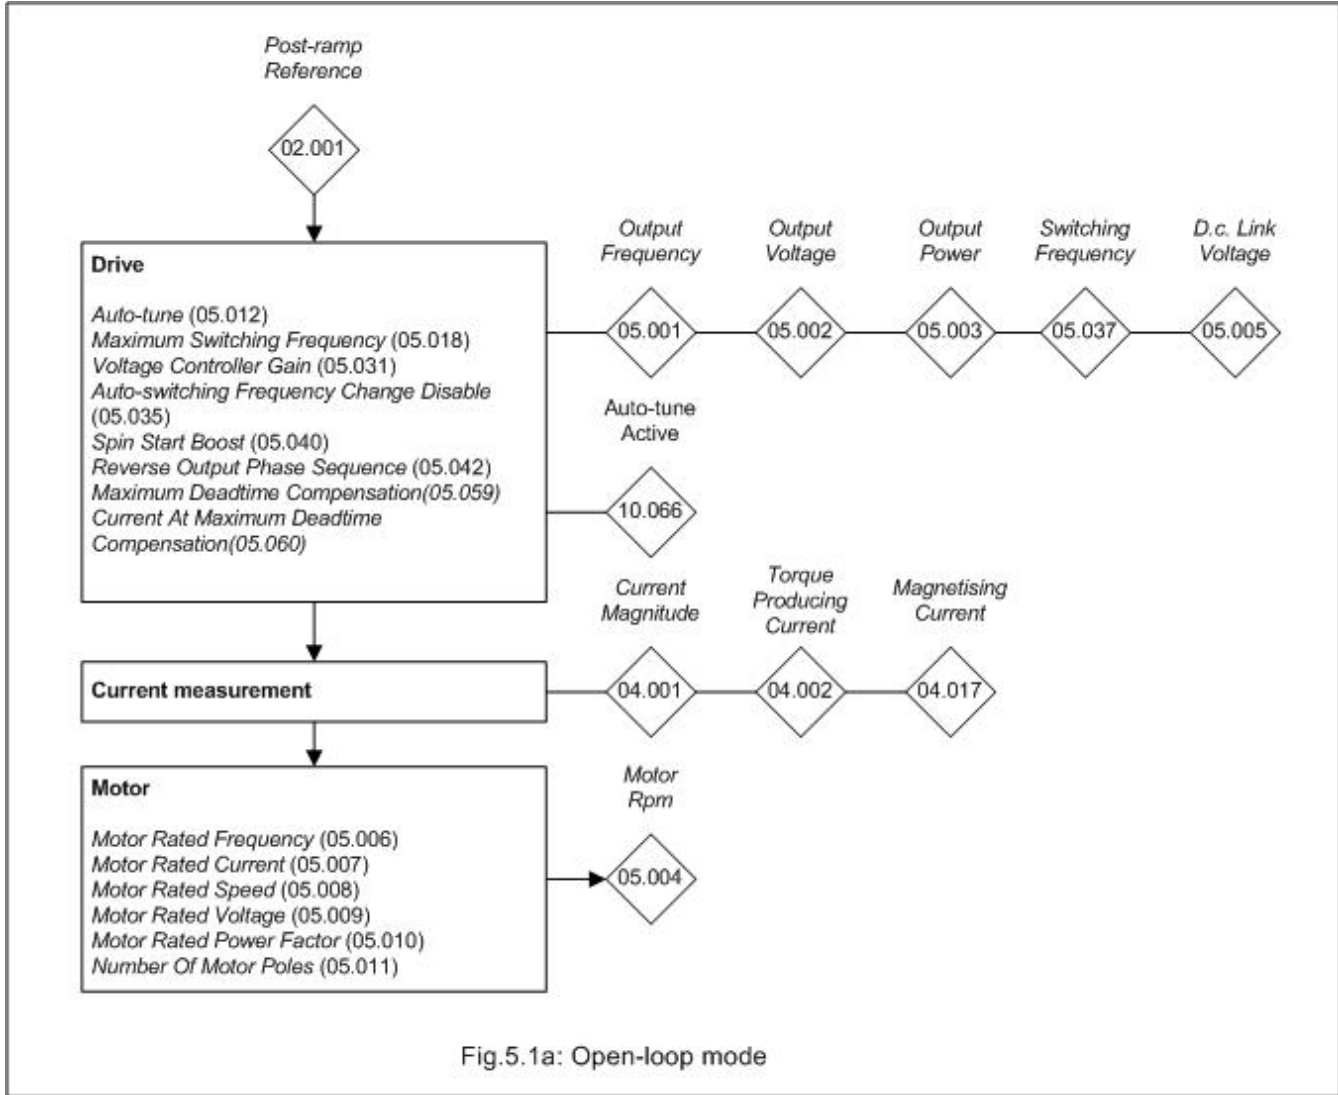

Fig.5.1a: Open-loop mode

Fig.5.1b: Closed-loop mode

Open-loop mode

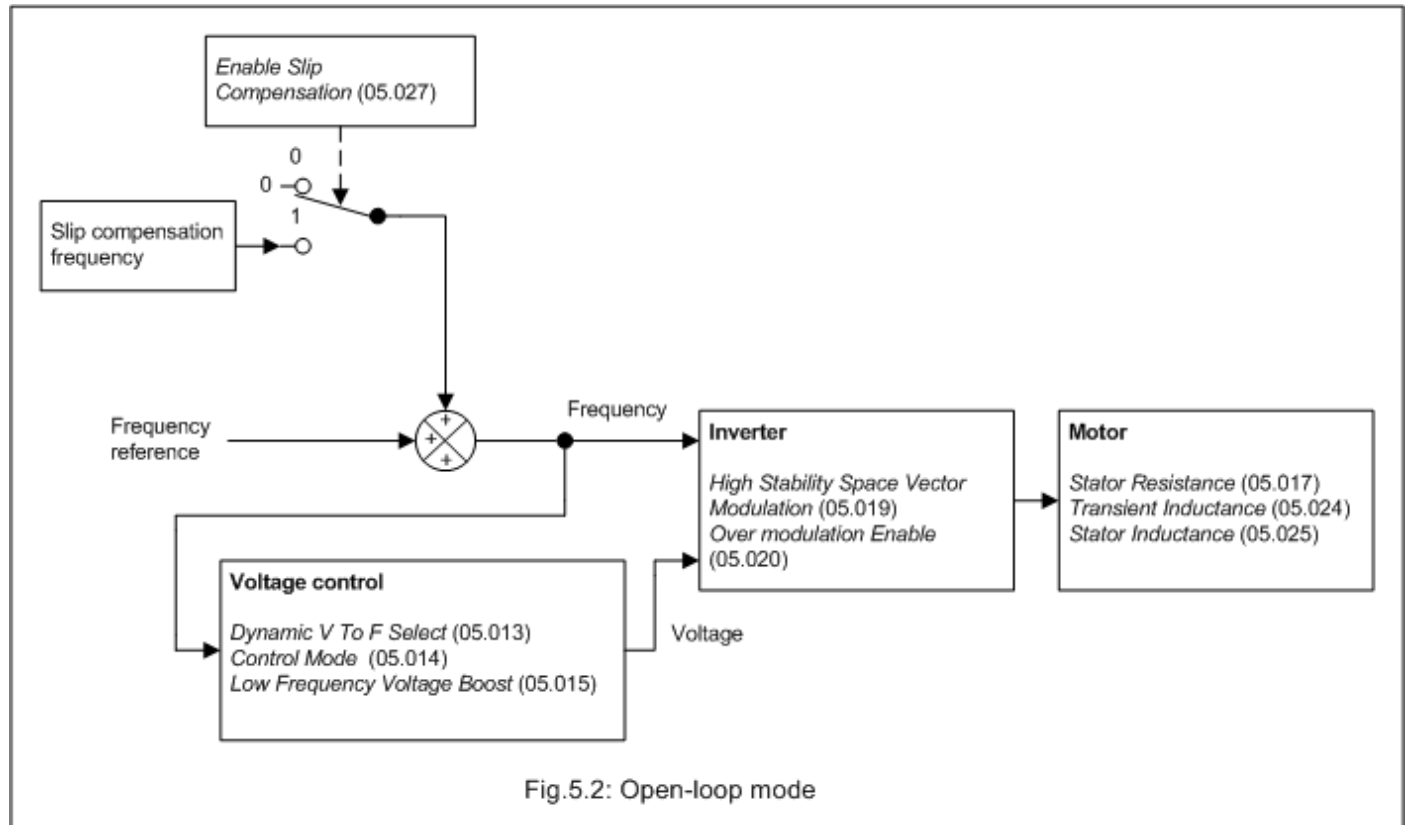

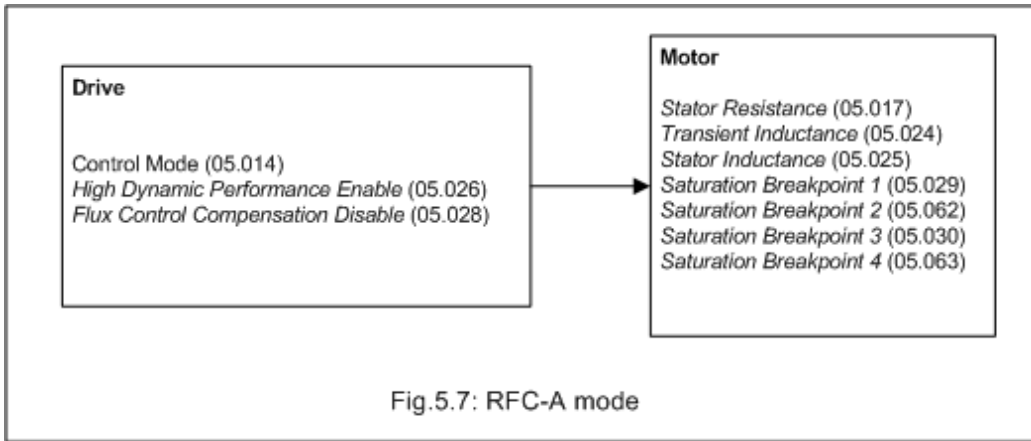

Fig.5.2: Open-loop mode

RFC operation

Parameter	05.001 Output Frequency		
Short description	Displays the output frequency of the drive		
Mode	RFC-A		
Minimum	-VM_SPEED_FREQ_REF	Maximum	VM_SPEED_FREQ_REF
Default		Units	Hz
Type	32 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, VM, ND, NC, PT		

The output frequency is not controlled directly, but the *Output Frequency* (05.001) is a measurement of the frequency applied to the motor.

Parameter	05.002 Output Voltage		
Short description	Displays the r.m.s. line to line voltage at the a.c. terminals of the drive		
Mode	RFC-A		
Minimum	-VM_AC_VOLTAGE	Maximum	VM_AC_VOLTAGE
Default		Units	V
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RO, FI, VM, ND, NC, PT		

The *Output Voltage* (05.002) is the r.m.s line to line voltage at the a.c. terminals of the drive.

Parameter	05.003 Output Power		
Short description	Displays the power flowing via the a.c. terminals of the drive		
Mode	RFC-A		
Minimum	-VM_POWER	Maximum	VM_POWER
Default		Units	kW
Type	32 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, VM, ND, NC, PT		

The *Output Power* (05.003) is the power flowing via the a.c. terminals of the drive. The power is derived as the dot product of the output voltage and current vectors, and so this is correct even if the motor parameters are incorrect and the motor model does not align the reference frame with the flux axis of a motor. A positive value of power indicates power flowing from the drive to the motor.

The maximum power is $VM_POWER[MAX] = \sqrt{3} \times VM_AC_VOLTAGE[MAX] \times Full\ Scale\ Current\ Kc\ (11.061) / 1000$

Parameter	05.004 Motor Rpm		
Short description	Displays the Final Demand Reference in units of rpm		
Mode	RFC-A		
Minimum	-80000	Maximum	80000
Default		Units	rpm
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, FI, ND, NC, PT		

$Motor\ Rpm\ (05.004) = 60 \times Frequency / Pole\ pairs$

where
Pole pairs = the numeric value of *Number Of Motor Poles* (i.e. 3 for a 6 pole motor)

The frequency used to derive the *Motor Rpm* (05.004) is the *Final Demand Reference* (03.001). The maximum and minimum values allow for a 10% over-shoot of the speed.

Parameter	05.005 D.c. Link Voltage		
Short description	Displays the voltage across the d.c. link of the drive		
Mode	RFC-A		
Minimum	-VM_DC_VOLTAGE	Maximum	VM_DC_VOLTAGE
Default		Units	V
Type	16 Bit Volatile	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RO, FI, VM, ND, NC, PT		

D.c. Link Voltage (05.005) gives the voltage across the d.c. link of the drive.

Parameter	05.006 Motor Rated Frequency		
Short description	Set to the rated frequency of the motor		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	See exceptions below	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

Region	Default Value
50Hz	50.00
60Hz	60.00

Motor Rated Frequency (05.006), Motor Rated Speed (05.008) and Number Of Motor Poles (05.011) are used to calculate the rated slip of the motor which is used by the motor control algorithm. An incorrect estimate of rated slip has the following effects:

1. Reduced efficiency
2. Reduction of maximum torque available from the motor
3. Reduced transient performance
4. Inaccurate control of absolute torque in torque control modes
5. The drive will produce rated flux in the motor in the shortest possible time when it is enabled. Incorrect parameter values will affect the flux build-up time.

Parameter	05.007 Motor Rated Current		
Short description	Set to the rated current rated of the motor		
Mode	RFC-A		
Minimum	-VM_RATED_CURRENT	Maximum	VM_RATED_CURRENT
Default	0.00	Units	A
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, VM, RA		

Motor Rated Current is used as follows:

1. To define the rated operating conditions for motor thermal protection. See *Thermal Protection Mode* (04.016).
2. To define the range of the current limits.
3. In the motor control algorithm for Open-loop and Closed Loop asynchronous modes.

Parameter	05.008 Motor Rated Speed		
Short description	Set to the rated speed of the motor		
Mode	RFC-A		
Minimum	0.0	Maximum	80000.0
Default	See exceptions below	Units	rpm
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Region	Default Value
50Hz	1500.0
60Hz	1800.0

Motor Rated Speed (05.008) is not used by the motor control algorithms, but it is used by the motor thermal protection system.

Parameter	05.009 Motor Rated Voltage		
Short description	Set to the rated voltage of the motor		
Mode	RFC-A		
Minimum	-VM_AC_VOLTAGE_SET	Maximum	VM_AC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Region	Default Value
110V	All	230
200V	All	230
400V	50Hz	400
400V	60Hz	460
575V	All	575
690V	All	690

The *Motor Rated Voltage* (05.009) is the maximum continuous voltage that is applied to the motor. Normally this should be set to the motor nameplate value. If the drive is supplied through its own diode rectifier the maximum possible output voltage is just below the supply voltage level, and so the output voltage will not reach *Motor Rated Voltage* (05.009) if this is equal to or above the supply voltage. If high transient performance is required at higher speeds then *Motor Rated Voltage* (05.009) should be set to 95% of the minimum d.c. link voltage divided by $\sqrt{2}$ to allow some headroom for the drive to control the motor current. If the drive is fed through its own diode rectifier the minimum d.c. link voltage is approximately supply voltage $\times \sqrt{2}$.

In some cases it may be necessary to set the *Motor Rated Voltage* (05.009) to a value other than the motor nameplate value. If this is the case the *Motor Rated Frequency* (05.006) and *Motor Rated Speed* (05.008) should be set up as follows:

$K = \text{Motor Rated Voltage (05.009)} / \text{motor rated voltage}$

$\text{Motor Rated Frequency (05.006)} = \text{motor rated frequency} \times K$

$\text{Motor Rated Speed (05.008)} = \text{motor rated speed} + [(K - 1) \times \text{motor rated frequency} \times 60 / (\text{number of motor poles} / 2)]$

The *Motor Rated Voltage* (05.009), *Motor Rated Frequency* (05.006) and *Number Of Motor Poles* (05.011) are used during the auto-tuning process to determine the flux level required in the motor for normal operation. Therefore if the *Motor Rated Voltage* (05.009) is set to a value other than the nameplate value and the above adjustment is not applied the motor may be under or over-fluxed

Parameter	05.010 Motor Rated Power Factor		
Short description	Set to the rated power factor of the motor. This value can be measured by the drive during a rotating autotune		
Mode	RFC-A		
Minimum	0.00	Maximum	1.00
Default	0.85	Units	
Type	16 Bit User Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	2
Coding	RW, RA		

Motor Rated Power Factor (05.010) is the true power factor of the motor under rated conditions, i.e. the cosine of the angle between the motor voltage and current. If *Stator Inductance* (05.025) is set to a non-zero value then the stator inductance is used to calculate the rated magnetising current for the motor and the rated power factor can be calculated by the drive. Therefore if *Stator Inductance* (05.025) is non-zero *Motor Rated Power Factor* (05.010) is continuously set to the calculated value of rated power factor by the drive. If *Stator Inductance* (05.025) is set to zero then *Motor Rated Power Factor* (05.010) is used to estimate the rated magnetising current which is an approximation and not as accurate. *Stator Inductance* (05.025) can be measured by the drive during auto-tuning and this is the preferred option, however, if it is not possible to obtain the value for *Stator Inductance* (05.025) then *Motor Rated Power Factor* (05.010) should be set to the motor nameplate value.

Parameter	05.011 Number Of Motor Poles		
Short description	Set to the number of poles of the motor		
Mode	RFC-A		
Minimum	0	Maximum	16
Default	0	Units	PolePairs
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

If *Number Of Motor Poles* (05.011) = 0 the number of motor poles are calculated automatically as given below.

$\text{Pole pairs} = 60 \times \text{Motor Rated Frequency (05.006)} / \text{Motor Rated Speed (05.008)}$ rounded down to the nearest integer

Parameter	05.012 Auto-tune		
Short description	Defines the auto-tune test to be performed		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

The following describes how an auto-tune test can be initiated and normal operation can be resumed after the test for Open loop, Closed loop mode:

1. An auto-tune test cannot be initiated if the drive is tripped or the drive inverter is active, i.e. *Drive Healthy* (10.001) = 0 or *Drive Active* (10.002) = 1. The inverter can be made inactive by ensuring that the Final drive enable is inactive (see Menu 06), or the Final drive run (see Menu 06) is inactive and *Hold Zero Frequency* (06.008) = 0.
2. An auto-tune test is initiated by setting *Auto-tune* (05.012) to a non-zero value and making the Final drive enable and the Final drive run active.
3. All tests that move the motor will move the motor in the forward direction if *Reverse Select* (01.012) = 0 or the reverse direction if *Reverse Select* (01.012) = 1. It should be noted that the motor may jump by up to half an electrical revolution in either direction at the start of auto-tuning test 1 in Synchronous mode whatever the value of *Reverse Select* (01.012), but after the initial jump the remainder of the test will be carried out in the correct direction.
4. If the auto-tune sequence is completed successfully the Final drive enable is set to the inactive state and *Auto-tune* (05.012) is set to zero. The Final drive enable can only be set to the active state again by removing the enable and reapplying it. The enable can be removed by setting *Drive Enable* (06.015) = 0, or by setting bit 0 of the *Control Word* (06.042) to 0 provided *Control Word Enable* (06.043) = 1, or by making *Hardware Enable* = 0.
5. If a trip occurs during the auto-tune sequence the drive will go into the trip state and *Auto-tune* (05.012) is set to zero. As in 4. above, the enable must be removed and re-applied before the drive can be restarted after the trip has been reset. However, care should be taken because if the auto-tune was not completed the drive parameters that should have been measured and set up will still have their original values.
6. If the Final drive enable is made active, the Final drive run is inactive and *Hold Zero Frequency* (06.008) = 1 the drive would normally be in the Stop state (i.e. the inverter is active, but the frequency or speed reference is 0). However, the transition from the Disable state to the Stop state cannot be made in closed loop mode if *Auto-tune* (05.012) is non-zero. This is intended to prevent the drive entering the Stop state when an auto-tune test is required, but the enable is applied before the run as the control of the motor may rely on position estimation.

The following describes the effects of the auto-tune test on the drive :

1. All auto-tune tests rely on the motor being stationary when the test is initiated to give accurate results.
2. If *Select Motor 2 Parameters* (11.045) = 0 then the parameters associated with motor map 1 are updated as a result of the test, and if *Select Motor 2 Parameters* (11.045) = 1 the parameters associated with motor map 2 are updated.
3. Only when the whole test is completed, are the results written to the appropriate parameters and these parameters saved in the drive non-volatile memory. If *Parameter Cloning* (11.042) is set to 3 or 4 the parameters are also written to a non-volatile media card fitted on the drive.

RFC-A mode

The table below shows the parameters required for motor control indicating which should be set by the user and which can be measured with an auto-tune test.

Parameter	Required for	Measured in test
<i>Motor Rated Frequency</i> (05.006)	Basic control	
<i>Motor Rated Current</i> (05.007)	Basic control	
<i>Motor Rated Speed</i> (05.008)	Basic control	
<i>Motor Rated Voltage</i> (05.009)	Basic control	
<i>Motor Rated Power Factor</i> (05.010)	Basic control	2
<i>Number Of Motor Poles</i> (05.011)	Basic control	
<i>Stator Resistance</i> (05.017)	Basic control	1, 2
<i>Transient Inductance</i> (05.024)	Basic control	1, 2
<i>Stator Inductance</i> (05.025)	Improved performance	2
<i>Saturation Breakpoint 1</i> (05.029)	Improved performance with flux weakening	2
<i>Saturation Breakpoint 3</i> (05.030)	Improved performance with flux weakening	2
<i>Maximum Deadtime Compensation</i> (05.059)	Basic control	1, 2
<i>Current At Maximum Deadtime Compensation</i> (05.060)	Basic control	1, 2
<i>Saturation Breakpoint 2</i> (05.062)	Improved performance with flux weakening	2
<i>Saturation Breakpoint 4</i> (05.063)	Improved performance with flux weakening	2
<i>Motor and Load Inertia</i> (03.018)	Frequency controller set-up and torque feed-forwards	3
<i>Current Controller Kp Gain</i> (04.013)	Basic control	1, 2
<i>Current Controller Ki Gain</i> (04.014)	Basic control	1, 2

Auto-tune test 1: Basic control parameters

This test measures the basic control parameters without moving the motor.

1. A stationary test is performed to measure *Stator Resistance* (05.017), *Transient Inductance* (05.024), *Maximum Deadtime Compensation* (05.059) and *Current At Maximum Deadtime Compensation* (05.060).
2. *Stator Resistance* (05.017) and *Transient Inductance* (05.024) are used to set up *Current Controller Kp Gain* (04.013) and *Current Controller Ki Gain* (04.014). This is only performed once during the test, and so the user can make further adjustments to the current controller gains if required.

Auto-tune test 2: Basic control and improved performance parameters

This test measures the parameters for improved performance by rotating the motor.

1. Auto-tune 1 test is performed.
2. A rotating test is performed in which the motor is accelerated with the currently selected ramps up to a frequency of *Motor Rated Frequency* (05.006) x 2/3, and the frequency is maintained at that level for up to 40 seconds. *Stator Inductance* (05.025) is measured and this value is used in conjunction with other motor parameters to calculate *Motor Rated Power Factor* (05.010). *Saturation Breakpoint 1* (05.029), *Saturation Breakpoint 3* (05.030), *Saturation Breakpoint 2* (05.062) and *Saturation Breakpoint 4* (05.063) are measured. The motor should be unloaded for this test.

Auto-tune test 3: Mechanical load measurement

A series of progressively larger torque levels are applied to the motor (20%, 40% ... 100% of rated torque) to accelerate the motor up to 3/4 x *Motor Rated Speed* (05.008) to determine the inertia from the acceleration/deceleration time. The test attempts to reach the required speed within 5s, but if this fails the next torque level is used. When 100% torque is used the test allows 60s for the required speed to be reached, but if this is unsuccessful a trip is initiated. To reduce the time taken for the test it is possible to define the level of torque to be used for the test by setting *Mechanical Load Test Level* (05.021) to a non-zero value. When the test level is defined the test is only carried out at the defined test level and 60s is allowed for the motor to reach the required speed. It should be noted that if the maximum speed allows for flux weakening then it may not be possible to achieve the required torque level to accelerate the motor fast enough. If this is the case, the maximum speed reference should be reduced.

1. The motor is accelerated in the required direction up to 3/4 of the maximum speed reference and then decelerated to zero speed.
2. The test is repeated with progressively higher torques until the required speed is reached.
3. The motor must be stationary at the start of the test.

The table below shows the trips that can occur during an auto-tune test:

Trip	Reason	Trip can occur in test
<i>Autotune Stopped</i>	The final drive enable or the final drive run were removed before the test was completed.	All
<i>Resistance</i>	The measured value of <i>Stator Resistance</i> (05.017) exceeded the range of the parameter.	1, 2
<i>Autotune 3</i>	The measured inertia exceeds the parameter range.	3

Parameter	05.013 Flux Optimisation Select		
Short description	Set to 1 to enable to reduce the flux		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Flux Optimisation Select*, *Dynamic V To F Select* (05.013) = 1, the flux is reduced so that the *Magnetising Current* (04.017) is equal to the *Torque Producing Current* (04.002) to optimise copper losses and reduce iron losses in the motor under low load conditions. The steady state range of the *Magnetising Current* (04.017) is limited between $I_{M\text{Rated}} / 2$ and $I_{M\text{Rated}}$.

Parameter	05.015 Low Frequency Voltage Boost		
Short description	Defines the level of voltage boost at 0Hz when using a fixed V to F relationship		
Mode	RFC-A		
Minimum	0.0	Maximum	25.0
Default	3.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

* 3.0% up to Size D, 2.0% for Size 7 and 8, and 1.0% for larger sizes

During auto-tune test 2 the drive uses the Open-loop mode control strategy with fixed voltage boost. *Low Frequency Voltage Boost* (05.015) is used to define the level of low voltage boost used during the test.

Parameter	05.017 Stator Resistance		
Short description	Defines the resistance of the motor stator		
Mode	RFC-A		
Minimum	0.0000	Maximum	99.9999
Default	0.0000	Units	Ω
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	4
Coding	RW, RA		

Asynchronous machines:

The *Stator Resistance* (05.017), *Transient Inductance* (05.024) and *Stator Inductance* (05.025) are derived from the star connected per phase equivalent circuit of an induction motor shown below.

The steady state parameters are converted to equivalent transient model parameters:

$$R_s = R_1$$

$$L_m = L_m$$

$$L_s = L_1 + L_m$$

$$L_r = L_2 + L_m$$

$$\sigma L_s = L_s - (L_m^2 / L_r)$$

The equivalent drive parameters are:

$$\text{Stator Resistance (05.017)} = R_s$$

$$\text{Transient Inductance (05.024)} = \sigma L_s$$

$$\text{Stator Inductance (05.025)} = L_s$$

Parameter	05.018 Maximum Switching Frequency		
Short description	Defines the maximum switching frequency that can be used by the drive		
Mode	RFC-A		
Minimum	-VM_MAX_SWITCHING_FREQUENCY	Maximum	VM_MAX_SWITCHING_FREQUENCY
Default	3	Units	kHz
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE, VM, RA		

Value	Text	Description
2	2	2kHz switching frequency
3	3	3kHz switching frequency
4	4	4kHz switching frequency
5	6	6kHz switching frequency
6	8	8kHz switching frequency
7	12	12kHz switching frequency
8	16	16kHz switching frequency

Maximum Switching Frequency (05.018) should be set to the required PWM switching frequency. The drive inverter will operate at this frequency unless *Auto-switching Frequency Change Disable* (05.035) = 0 and the inverter temperature exceeds the threshold for automatic switching frequency reduction (see *Inverter Temperature* (07.034)). The actual switching frequency is shown in *Switching Frequency* (05.037). The switching frequency has a direct effect on the sample rate for the current controllers (see *Current Controller Kp Gain* (04.013)). All other control tasks are at a fixed rate of 1ms.

Note: 0.667kHz and 1kHz switching frequencies are not supported in RFC-A mode.

As default *Auto-switching Frequency Change Disable* (05.035) = 0 and the system described above is always active. If *Auto-switching Frequency Change Disable* (05.035) = 1 then the automatic switching frequency changing system is disabled. If *Auto-switching Frequency Change Disable* (05.035) = 2 the system is active, but does not take into account the device temperature at low output frequencies.

We recommend that a minimum ratio of 12:1 for the switching frequency compared to the output frequency is used.

Parameter	05.021 <i>Mechanical Load Test Level</i>		
Short description	Mechanical Load Test Level		
Mode	RFC-A		
Minimum	0	Maximum	100
Default	0	Units	%
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Auto-tune* (05.012).

Parameter	05.024 <i>Transient Inductance</i>		
Short description	Defines the inductance of the transient components in the motor stator		
Mode	RFC-A		
Minimum	0.000	Maximum	500.000
Default	0.000	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, RA		

See *Stator Resistance* (05.017).

Parameter	05.025 <i>Stator Inductance</i>		
Short description	Defines the inductance of the motor stator		
Mode	RFC-A		
Minimum	0.00	Maximum	5000.00
Default	0.00	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, RA		

See *Stator Resistance* (05.017).

Parameter	05.026 <i>High Dynamic Performance Enable</i>		
Short description	Set to 1 to enable slip compensation		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Whatever the value of *High Dynamic Performance Enable* (05.026) a feed-forward term based on the estimated level of flux in the motor and the motor speed is used to improve the performance of the current controllers and to avoid transients during spinning start. However, if *High Dynamic Performance Enable* (05.026) = 1 additional feed-forward terms are provided to remove the effects of cross-coupling between the flux and torque axes. This improves the performance of the current controllers under dynamic conditions at high frequencies.

Parameter	05.028 <i>Flux Control Compensation Disable</i>		
Short description	Set to 1 to disable Flux Control Compensation		
Mode	RFC-A		
Minimum	0	Maximum	0
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Flux Control Compensation Disable* (05.028) = 0 the conversion from the *Final Torque Reference* (04.003) to *Final Current Reference* (04.004) uses the estimated level of motor flux. This is the preferred method of control as it ensures that the gain of the system remains constant in speed control mode and it gives the correct relationship between torque and current in torque control modes. However, it is possible to get instability in speed control mode when flux weakening is active at high speed if the *Motor Rated Speed* (05.008) is set to an incorrect value. If *Flux Control Compensation Disable* (05.028) = 1 the compensation for flux level is disabled which can sometimes prevent instability under these conditions.

Parameter	05.029 <i>Saturation Breakpoint 1</i>		
Short description	Defines Saturation Breakpoint 1 within the saturation characteristic		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default	50.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

The relationship between the *Magnetising Current* (04.017) and the motor flux is non-linear because of saturation. For accurate control of torque and good dynamic performance when flux weakening is active it is important that the control system can estimate the flux level from the *Magnetising Current* (04.017). The saturation characteristic is provided with a set of breakpoints as shown below.

Fig.5.8: Motor saturation characteristic

The default values for the breakpoints are *Saturation Breakpoint 1* (05.029) = 50.0%, *Saturation Breakpoint 2* (05.062) = 0.0%, *Saturation Breakpoint 3* (05.030) = 75.0% and *Saturation Breakpoint 4* (05.063) = 0.0%. For compatibility with Unidrive SP, *Saturation Breakpoint 2* (05.062) and *Saturation Breakpoint 4* (05.063) are ignored if they are left at their default values of 0.0%. Therefore the default values give a linear relationship between the *Magnetising Current* (04.017) and the flux. The required values are not normally available from the motor manufacturer and should be obtained by auto-tuning.

Parameter	05.030 Saturation Breakpoint 3		
Short description	Defines Saturation Breakpoint 3 within the saturation characteristic		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default	75.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *Saturation Breakpoint 1* (05.029).

Parameter	05.031 Voltage Controller Gain		
Short description	Defines the proportional gain of the d.c. link voltage controller		
Mode	RFC-A		
Minimum	1	Maximum	30
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Voltage Controller Gain (05.031) can be used to modify the proportional gain of the d.c. link voltage controller used for standard ramp and supply loss control.

Parameter	05.032 Torque Per Amp		
Short description	Displays the calculated value of kt for the attached motor		
Mode	RFC-A		
Minimum	0.00	Maximum	500.00
Default		Units	Nm/A
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT, BU		

Torque Per Amp (05.032) is automatically calculated from the motor parameters assuming a motor efficiency of 90%.

$$\text{Torque Per Amp (05.032)} = \text{Estimated rated shaft power} / [((\text{Motor Rated Speed} \times 2\pi) / 60) \times I_{T\text{Rated}}]$$

where

$I_{T\text{Rated}}$ is the rated torque producing current and

$$\text{Estimated rated shaft power} = \sqrt{3} \times \text{Motor Rated Voltage (05.009)} \times \text{Motor Rated Current (05.007)} \times \text{Motor Rated Power Factor (05.010)} \times 0.9$$

Torque Per Amp (05.032) is used in the automatic calculation of the speed controller gains.

Parameter	05.034 Percentage Flux		
Short description	Displays the flux level in the motor		
Mode	RFC-A		
Minimum	0.0	Maximum	150.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, FI, ND, NC, PT		

Percentage Flux (05.034) gives an indication of the flux level in the motor where a value of 100% is equivalent to the rated flux level for the motor.

Parameter	05.035 Auto-switching Frequency Change Disable		
Short description	Set to 1 to prevent the drive from changing between switching frequencies		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Maximum Switching Frequency* (05.018).

Parameter	05.037 Switching Frequency		
Short description	Displays the current switching frequency used by the drive		
Mode	RFC-A		
Minimum	-VM_MAX_SWITCHING_FREQUENCY	Maximum	VM_MAX_SWITCHING_FREQUENCY
Default		Units	kHz
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, VM, ND, NC, PT		

Value	Text	Description
2	2	2kHz switching frequency
3	3	3kHz switching frequency
4	4	4kHz switching frequency
5	6	6kHz switching frequency
6	8	8kHz switching frequency
7	12	12kHz switching frequency
8	16	16kHz switching frequency

See *Maximum Switching Frequency* (05.018).

Parameter	05.038 Minimum Switching Frequency		
Short description	Defines the minimum switching frequency that can be used by the drive		
Mode	RFC-A		
Minimum	0	Maximum	VM_MAX_SWITCHING_FREQUENCY
Default	0	Units	kHz
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE, VM, RA		

Value	Text	Description
0	0.667	667Hz switching frequency
1	1	1kHz switching frequency
2	2	2kHz switching frequency
3	3	3kHz switching frequency
4	4	4kHz switching frequency
5	6	6kHz switching frequency
6	8	8kHz switching frequency
7	12	12kHz switching frequency
8	16	16kHz switching frequency

Minimum Switching Frequency (05.038) defines the minimum frequency limit used if the inverter thermal model is actively reducing the switching frequency due to temperature.

Note that parameter *Maximum Switching Frequency* (05.018) takes priority over parameter *Minimum Switching Frequency* (05.038) so is not limited by parameter *Minimum Switching Frequency* (05.038). The actual minimum switching frequency limit used is the lower of *Maximum Switching Frequency* (05.018) and *Minimum Switching Frequency* (05.038).

Parameter	05.040 Spin Start Boost		
Short description	Defines the level of spin start boost used by the algorithm that detects the speed of a spinning motor		
Mode	RFC-A		
Minimum	0.0	Maximum	10.0
Default	1.0	Units	
Type	8 Bit User Save	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RW		

Spin Start Boost (05.040) is used by the algorithm that detects the frequency of a spinning motor when the drive is enabled and *Catch A Spinning Motor* (06.009) ≥ 1 . For smaller motors the default value of 1.0 is suitable, but for larger motors *Spin Start Boost* (05.040) may need to be increased. If *Spin Start Boost* (05.040) is too small the drive will detect zero speed whatever the frequency of the motor, and if *Spin Start Boost* (05.040) is too large the motor may accelerate away from standstill when the drive is enabled.

Parameter	05.042 Reverse Output Phase Sequence		
Short description	Set to 1 to reverse the sequence on the output phases		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Reverse Output Phase Sequence* (05.042) = 0 the output phase sequence is U-V-W when *Output Frequency* (05.001) is positive and W-V-U when *Output Frequency* (05.001) is negative. If *Reverse Output Phase Sequence* (05.042) = 1 the output phase sequence is reversed so that the phase sequence in W-V-U for positive frequencies and U-V-W for negative frequencies.

Parameter	05.059 Maximum Deadtime Compensation		
Short description	Maximum Deadtime Compensation		
Mode	RFC-A		
Minimum	0.000	Maximum	10.000
Default	0.000	Units	μ s
Type	16 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	3
Coding	RO, NC, PT		

Maximum Deadtime Compensation (05.059) is the deadtime compensation used to compensate for dead-time effects in the inverter. This level of compensation is used when the drive output current is above *Current At Maximum Deadtime Compensation* (05.060) Both of these values related to dead-time compensation are measured during auto-tuning and cannot be set by the user. It should be noted that if the auto-tuning test is not performed and *Maximum Deadtime Compensation* (05.059) = 0 then dead-time compensation is disabled. Although it is not recommended, it is possible to disable dead-time compensation by setting *Disable Deadtime Compensation* (05.061) = 1.

Parameter	05.060 Current At Maximum Deadtime Compensation		
Short description	Current at which maximum deadtime compensation is applied		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	Background Read

Coding	RW		

Open-loop and RFC modes. User set maximum switching frequencies 2kHz to 6kHz only.

Swaps to 16kHz if the output current magnitude is less than 30% (Frame sizes 1-4) and 20% (Frame sizes 5 and above) drive OI.AC limit for longer than 100ms.

Swaps back immediately if the output current magnitude is greater than 15% drive OI.AC limit.

The original switching frequency may still be under the control of the inverter thermal model. This feature is disabled if the thermal model or user have changed the switching frequency within the last 10 seconds.

Parameter	05.084 <i>Low Frequency Estimator Threshold</i>		
Short description	Controls the RFC-A estimator threshold		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Open-Loop mode:

In resistor compensation open loop modes (*Control Mode* (05.014) set to 0, 1, 3, and 4):

If the rated slip frequency is non-zero, the rated slip frequency (see *Motor Rated Frequency* (05.006) can be modified when the output frequency is below one third of the motor rate frequency to provide a torque boost.

The modification consists of an addition to the calculated slip frequency controlled by the user parameter *Low Frequency Estimator Threshold, Low Frequency Slip Boost* (05.084). The addition is equal to *Low Frequency Estimator Threshold, Low Frequency Slip Boost* (05.084) at zero Hz falling linearly to 0.0% at one third of the motor rated frequency.

If the rated slip frequency is zero, the amount of stator resistor compensation can be modified when the output frequency is below one tenth of the motor rate frequency to provide a torque boost. The modification consists of an addition to the calculated stator resistor compensation controlled by the user parameter *Low Frequency Estimator Threshold, Low Frequency Slip Boost* (05.084). The addition is equal to *Low Frequency Estimator Threshold,*

Low Frequency Slip Boost (05.084). at zero Hz falling linearly to 0.0% at one tenth of the motor rated frequency.

In fixed boost tapered open loop control (*Control Mode* (05.014) set to 6):

Low Frequency Estimator Threshold, Low Frequency Slip Boost (05.084) sets the frequency at which the taper of the slip begins. This is expressed in *Low Frequency Estimator Threshold, Low Frequency Slip Boost* (05.084) as a percentage of the motor rated frequency, *Motor Rated Frequency* (05.006) . See #5.014 = 6.

RFC-A mode:

If *Low Frequency Estimator Threshold, Low Frequency Slip Boost* (05.084) = 0.0% (default) the RFC-A speed estimator is used when the ramp output is greater than the rated motor frequency divided by 64.

If *Low Frequency Estimator Threshold, Low Frequency Slip Boost* (05.084) > 0.0% , the RFC-A speed estimator is used when the ramp output is greater than the rated motor frequency divided by 128.

Menu 6 – Sequencer and Clock

Mode: RFC-A

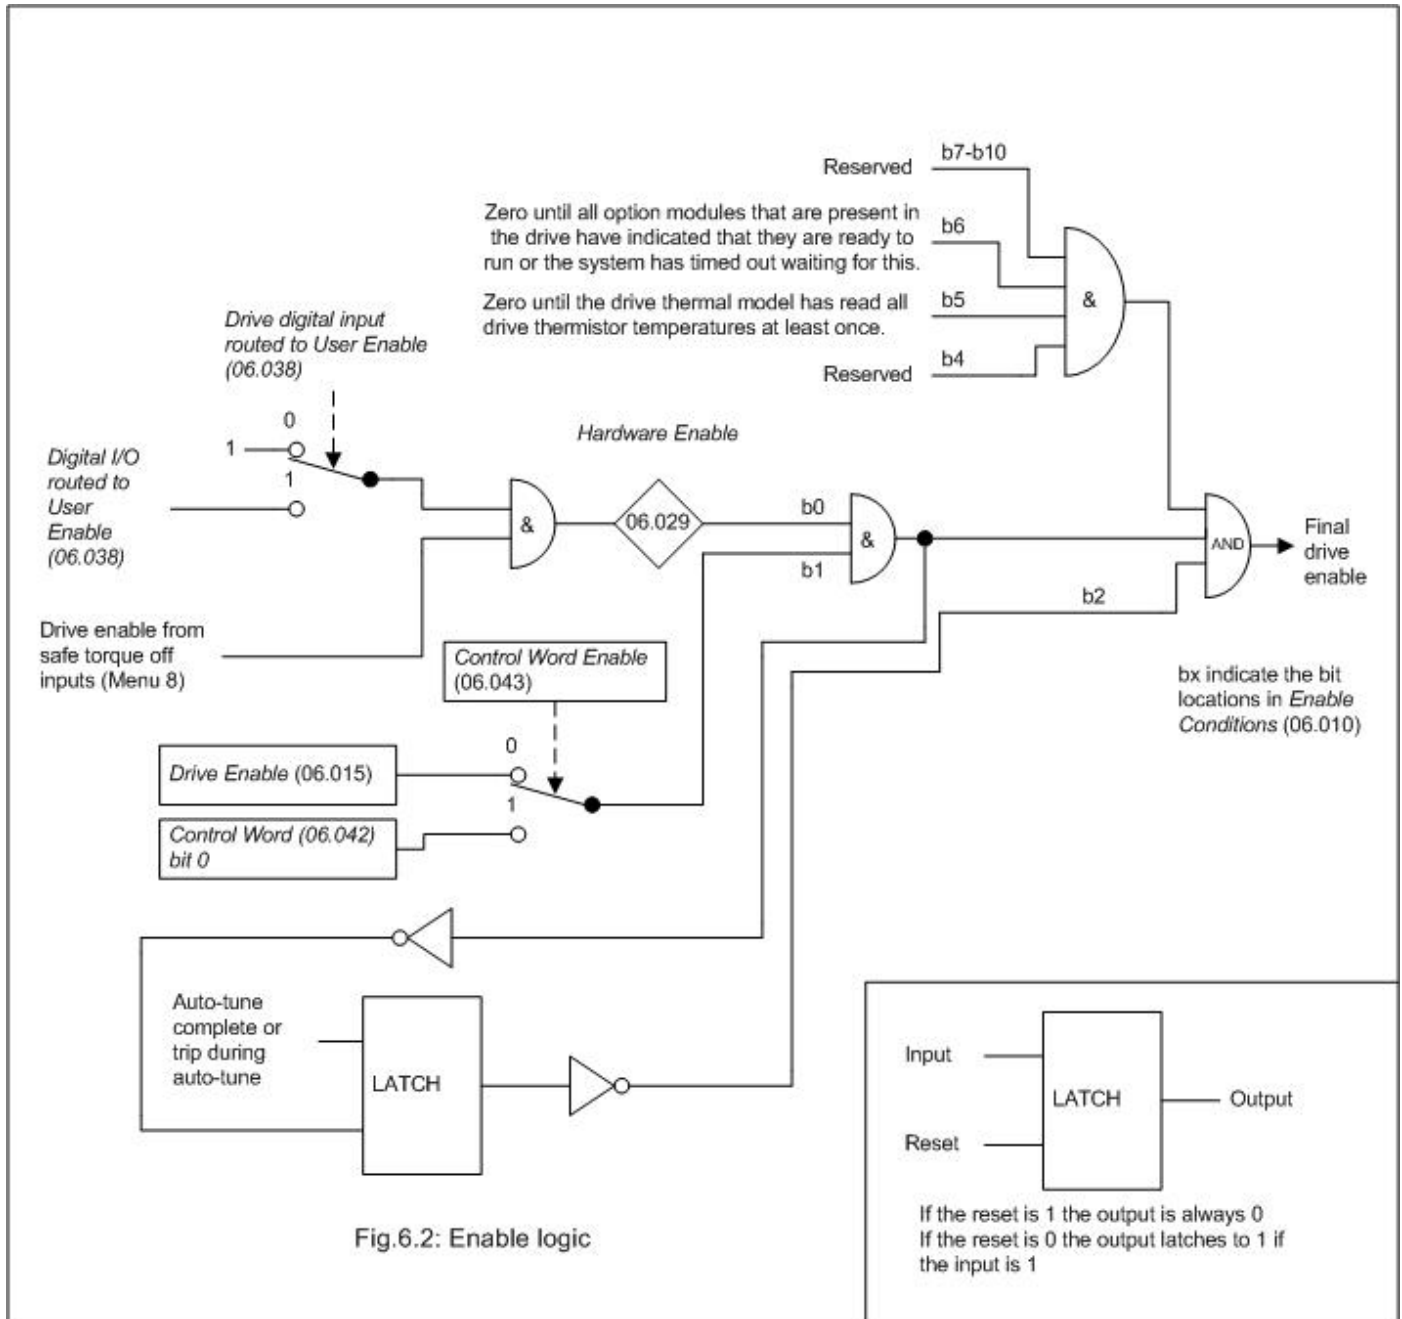

Sequencer

The diagram below shows the sequencer all modes.

The sequencer, which provides overall control of the drive, is implemented in two stages. The first stage includes the enable logic and sequencer logic and consists of static logic elements. The second stage is a state machine with internal states.

Enable logic

Hardware Enable (06.029) follows the safe torque off enable signal provided none of the digital inputs that are integral to the drive are routed to the **User Enable (06.038)**. The safe torque off hardware includes a delay in detecting a change from the enable to disable state of up to 20ms, but for most applications this is not a problem.

If the safety function of the safe torque off input is required then there must not be a direct connection between the safe torque off input and any other digital I/O on the drive. If the safety function of the safe torque off input and a disable function are required together, then the drive should be given two separate independent enable input signals. A signal from a safe source should be connected to the safe torque off input on the drive. A second enable should be connected to the digital I/O selected for the disable function. The circuit must be arranged so that a fault which causes the digital input to be forced high cannot cause the safe torque off input to be forced high as well, including the case where a component such as a blocking diode has failed.

Sequencer logic

The diagram below shows the sequencer logic when *Reference Selected Indicator* (01.049) is not equal to 4 (i.e. keypad control mode is not selected). The definition of the logic symbols are given in Fig.6.5

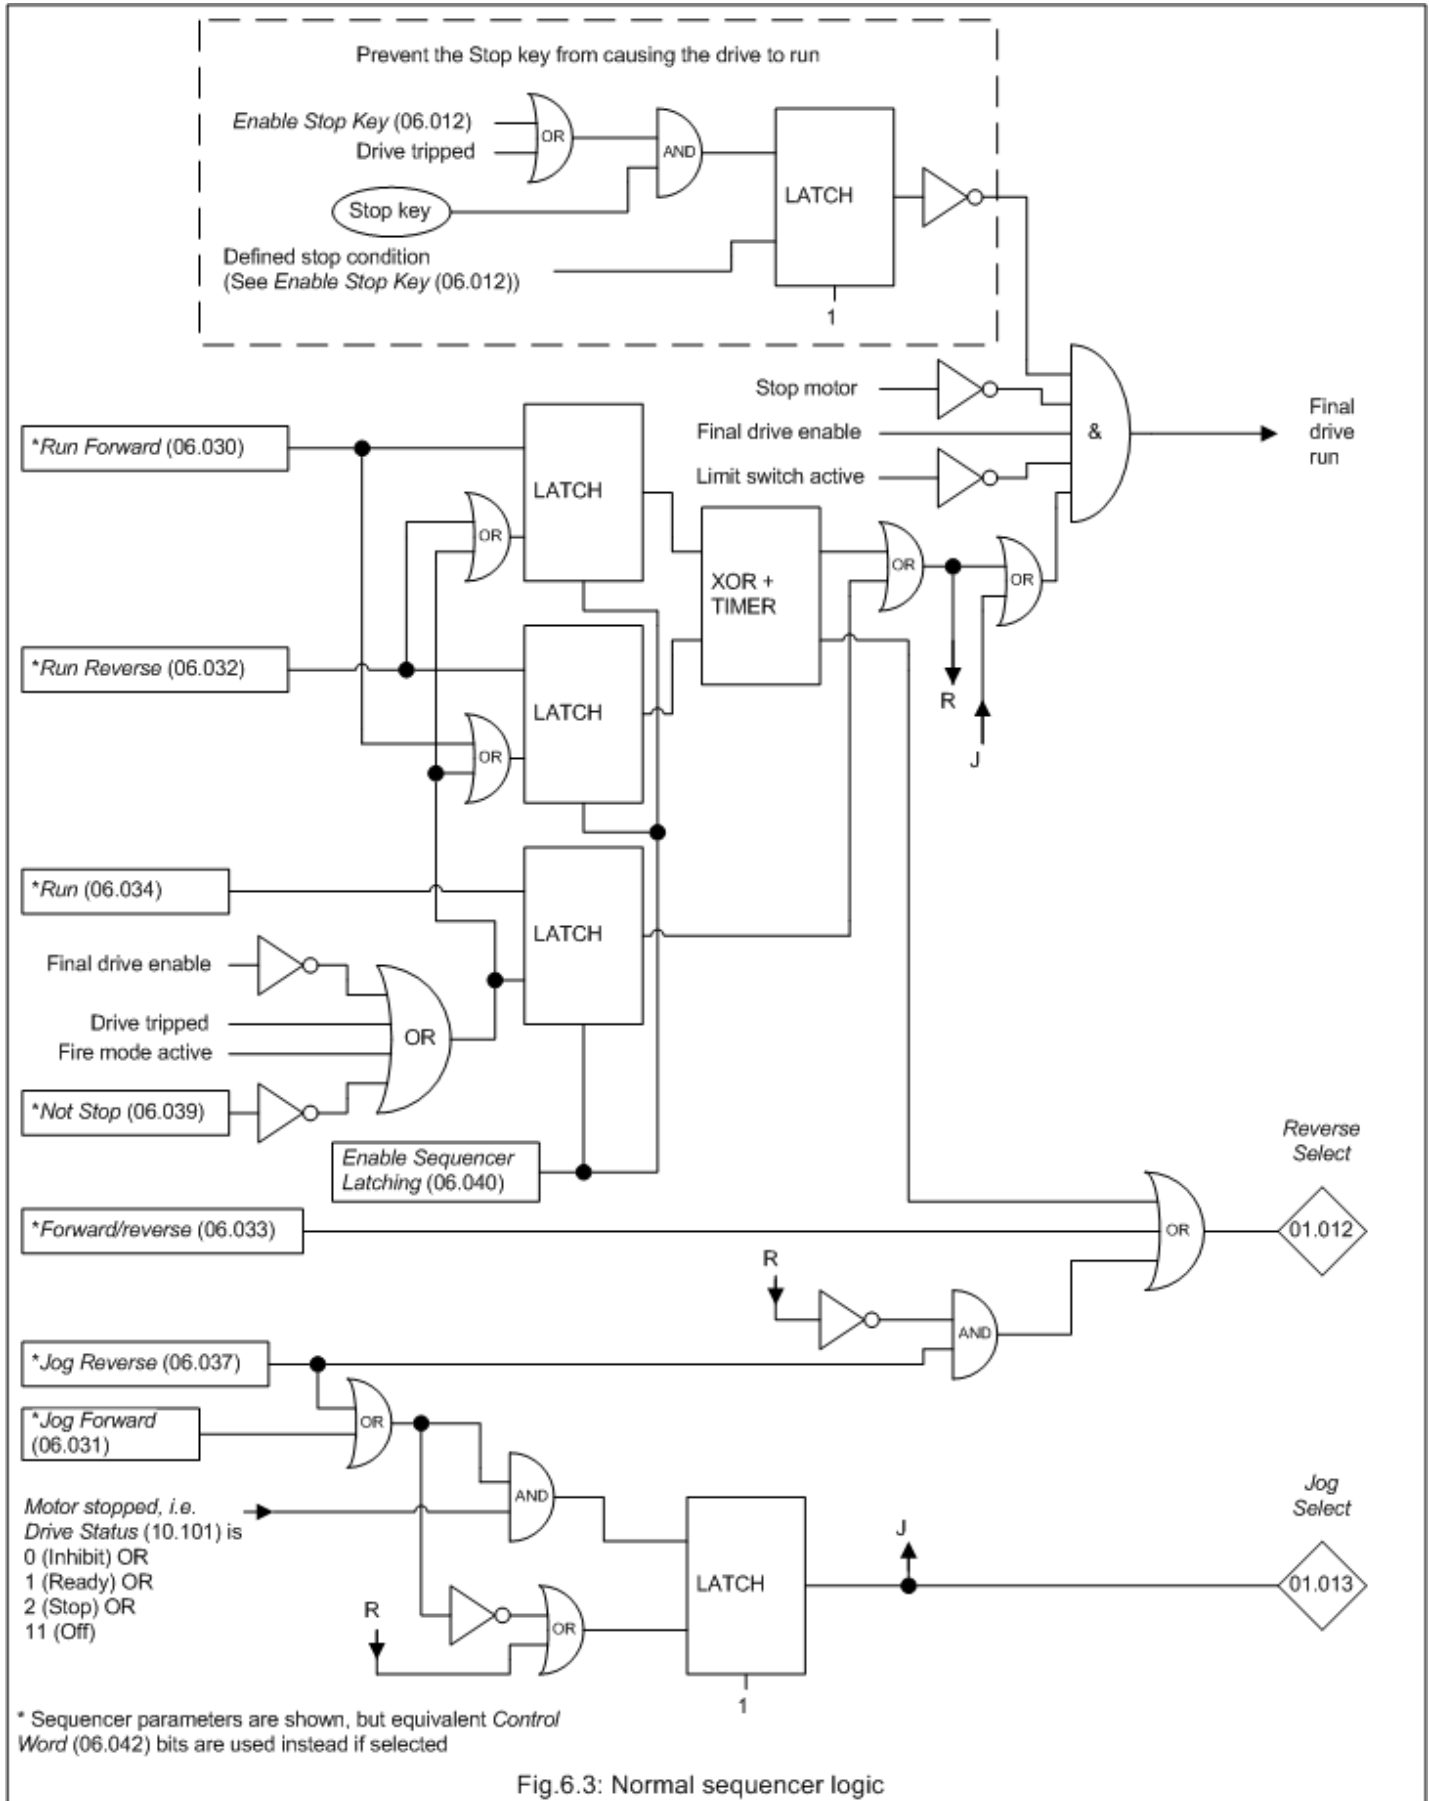

Fig.6.3: Normal sequencer logic

The diagram below shows the sequencer logic when *Reference Selected Indicator* (01.049) = 4 (i.e. keypad control mode is selected). The definition of the logic symbols are given in Fig.6.7

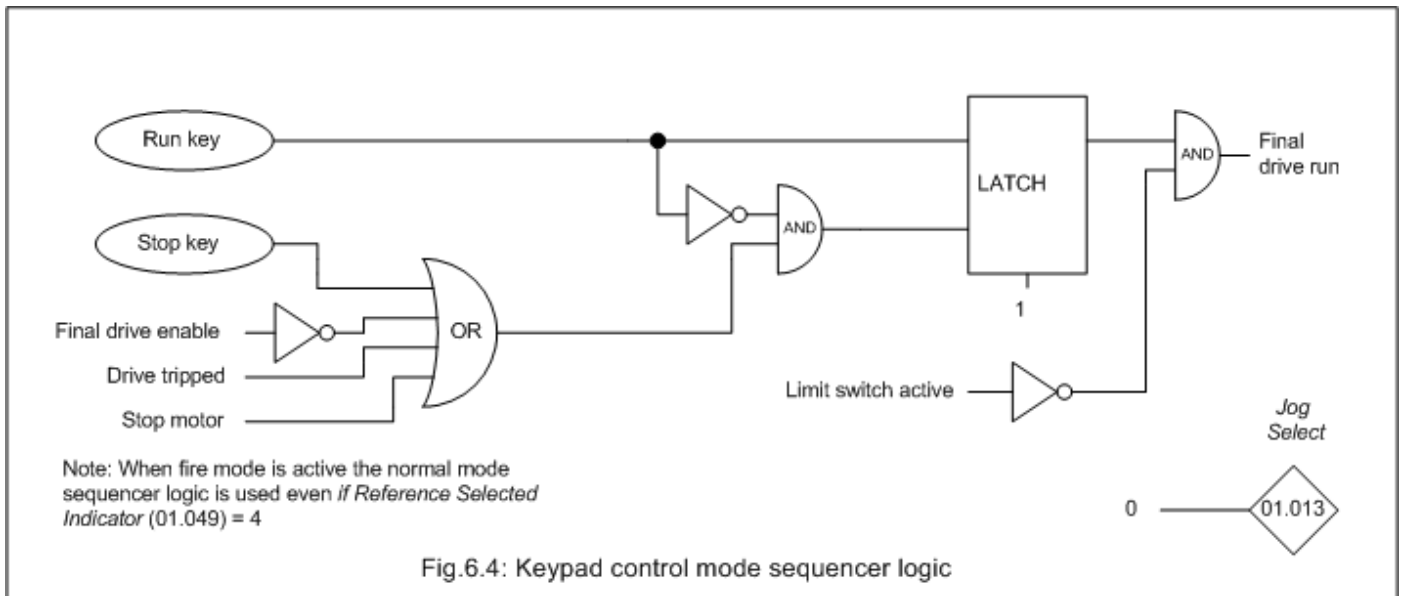

Fig.6.4: Keypad control mode sequencer logic

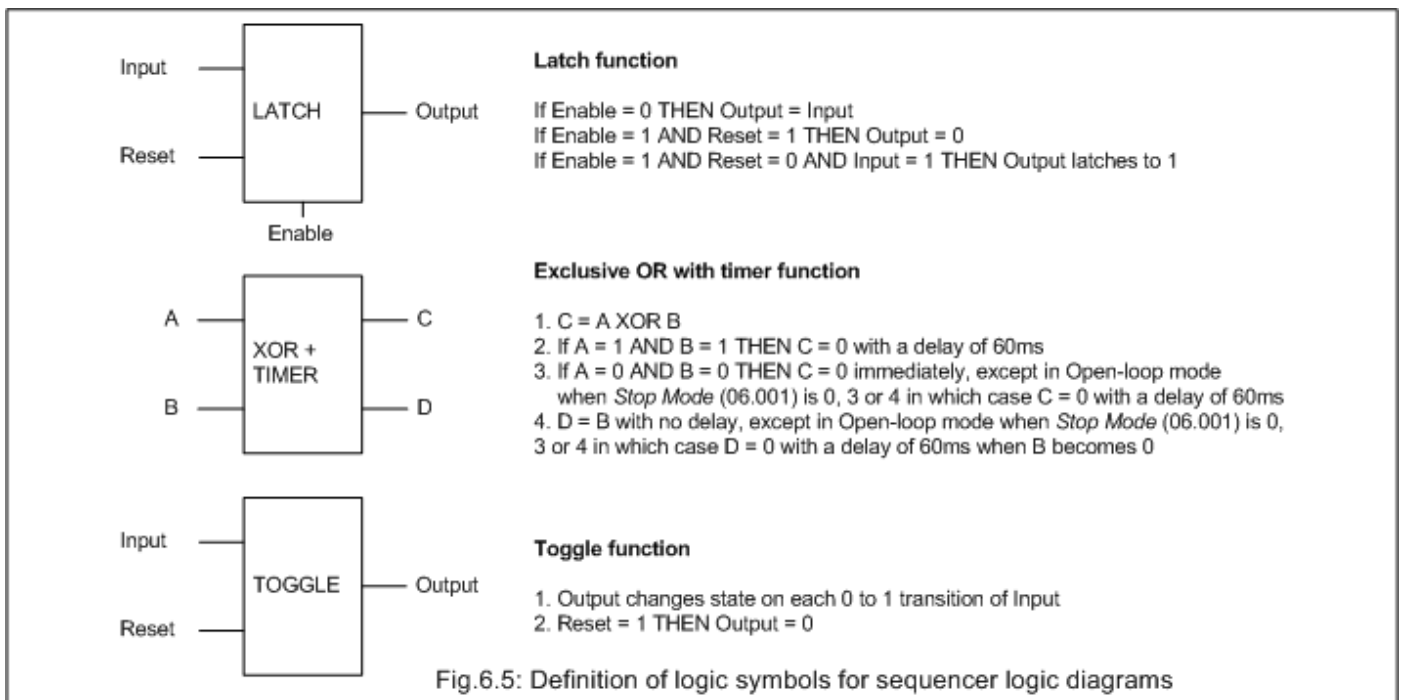

Fig.6.5: Definition of logic symbols for sequencer logic diagrams

Throughout this section reference is made to the sequencer bit parameters *Drive Enable* (06.015), *Run Forward* (06.030), *Jog Forward* (06.031), *Run Reverse* (06.032), *Forward/Reverse* (06.033), *Run* (06.034), *Jog Reverse* (06.037) and *Not Stop* (06.039). If *Control Word Enable* (06.043) = 1 and bit 7 (Auto/manual) in the *Control Word* (06.042) is 1 then the appropriate bits in the control word are used instead.

Parameter	06.001 Stop Mode		
Short description	Defines how the motor is controlled when the run signal is removed from the drive		
Mode	RFC-A		
Minimum	0	Maximum	6
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Coast	Coast stop
1	Ramp	Ramp stop
2	Ramp dc I	Ramp stop + 1 second dc injection
3	dc I	Injection braking stop with detection of zero speed
4	Timed dc I	Timed injection braking stop
5	Disable	Disable
6	No Ramp	No ramp

There is only one phase during the stopping sequence as shown in the table below for each of the possible values of *Stop Mode* (06.001).

Stop Mode (06.001)	Description
0: Coast	Stop Mode (06.001) = 0 (Coast) the inverter is inhibited immediately when the Final drive run is de-activated. If however, Hold Zero Frequency (06.008) = 1, then the inverter will be re-enabled to hold zero speed. The result is that the inverter is disabled for one sample and then enabled to ramp the motor to a stop. Therefore is coast stop is required Hold Zero Frequency (06.008) should be set to 0.
1: Ramp	If Stop Mode (06.001) = 1 (ramp) the relevant ramp rate is used to stop the motor even if Ramp Enable (02.002) = 0.
2: Ramp followed by d.c. injection	Same as 6.
3: D.c. injection with zero frequency detection	Same as 6.
4: Timed d.c. injection stop	Same as 6.
5: Disable	Inverter disabled
6: No ramp	Stop under current limit

Parameter	06.002 Limit Switch Stop Mode		
Short description	Defines the behaviour of the drive when limit switch is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Stop
1	Ramp

If Limit Switch Stop Mode (06.002) = 0 then when Limit Switch Active (10.066) is activated the motor is stopped without ramps (under current limit for closed loop or dc injection for open loop).

If Limit Switch Stop Mode (06.002) = 1 then the motor is stopped with the currently selected ramp rate.

Parameter	06.003 Supply Loss Mode		
Short description	Defines the behaviour of the drive when the supply voltage is reduced		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Disable	Disabled
1	Ramp Stop	Ramp stop
2	Ride Thru	Ride through
3	Limit Stop	Limit stop

If Supply Loss Mode (06.003) > 0 and the D.c. Link Voltage (05.005) falls below Supply Loss Detection Level (06.048) then the supply loss condition is detected. If Supply Loss Mode (06.003) = 2 (ride through) the supply loss system will attempt to control the D.c. Link Voltage (05.005) to a level just below the Supply Loss Detection Level (06.048) using a d.c. link voltage controller which provides a torque producing current reference to the current controllers to regulate the power flow into the d.c. link. Therefore Current Controller Kp Gain (04.013) and Current Controller Ki Gain (04.014) must be set up correctly for the application. When the supply is reapplied it must be at a level that is high enough for the D.c. Link Voltage (05.005) to rise above Supply Loss Detection Level (06.048) plus a hysteresis margin. This will disable the supply loss controller and the drive will return to normal operation. The table below gives the d.c. link voltage levels used by the supply loss detection system for different drive voltage ratings.

Voltage level	200V	400V	575V	690V
Supply loss d.c. link voltage control level	Supply Loss Detection Level (06.048) - 10V	Supply Loss Detection Level (06.048) - 20V	Supply Loss Detection Level (06.048) - 25V	Supply Loss Detection Level (06.048) - 25V
Voltage above which supply loss detection changes from active to inactive	Supply Loss Detection Level (06.048) + 10V	Supply Loss Detection Level (06.048) + 15V	Supply Loss Detection Level (06.048) + 50V	Supply Loss Detection Level (06.048) + 50V

0: Disable

No supply loss detection is provided by monitoring the D.c. Link Voltage (05.005). The drive will continue to operate normally unless the under voltage condition is detected.

1: Ramp Stop

The action taken by the drive is the same as for ride through mode, except that the ramp down rate is at least as fast as the currently selected deceleration ramp and the drive will continue to decelerate and stop even if the supply is re-applied. If *Stop Mode* (06.001) = 3 or 4 (i.e. d.c. injection) the drive will use ramp mode to stop on loss of the supply. If *Stop Mode* (06.001) = 2 (i.e. ramp stop followed by injection) the drive will ramp to a stop and then attempt to apply d.c. injection. The ramp down rate is at least as fast as the currently selected deceleration ramp and the drive will continue to decelerate and stop even if the supply is re-applied. Once the sequencer state machine has reached the DISABLE state the drive can restart provided the necessary controls are still active to initiate a start.

2: Ride through

The drive attempts to control the d.c. link voltage to take energy from the motor and load inertia to ride through the Supply loss condition for as long as possible.

3: Limit Stop - Closed loop

The frequency reference is set to zero and the ramps are disabled allowing the drive to decelerate the motor to a stop under current limit. If the supply is re-applied while the motor is stopping any run signal is ignored until the motor has stopped. If the current limit value is set at a very low level the drive may trip UU before the motor has stopped. Once the sequencer state machine has reached the DISABLE state the drive can restart provided the necessary controls are still active to initiate a start.

Parameter	06.004 Start/Stop Logic Select		
Short description			
Mode	RFC-A		
Minimum	0	Maximum	6
Default	5	Units	
Type	8 Bit User Save	Update Rate	Actioned on exit of edit mode and on drive reset
Display Format	Standard	Decimal Places	0
Coding	RW		

This parameter changes the functions of the input terminals which are normally associated with the enabling, starting and stopping the drive. This also writes to *Enable Sequencer Latching* (06.040) to enable and disable the input latches.

Start/Stop Logic Select (06.004)	Digital I/O 2	Digital Input 3	Digital Input 4	
Base and Standard	Terminal 8	Terminal 9	Terminal 10	<i>Enable Sequencer Latching</i> (06.040)
Premium	Terminal 11	Terminal 12	Terminal 13	<i>Enable Sequencer Latching</i> (06.040)
0 (default)	User Enable	Run Forward	Run Reverse	0 (non-latching)
1	Not Stop	Run Forward	Run Reverse	1 (latching)
2	User Enable	Run	Reverse	0 (non-latching)
3	Not Stop	Run	Reverse	1 (latching)
4	Not Stop	Run	Jog Forward	1 (latching)
5	User programmable	Run Forward	Run Reverse	0 (non-latching)
6	User programmable	User programmable	User programmable	User programmable

Start/Stop Logic Select (06.004), *Enable Sequencer Latching* (06.040), *Digital IO2 Source/Destination A* (08.022), *Digital Input 03 Destination A* (08.023) and *Digital Input 04 Destination A* (08.024) are also saved when this parameter is modified. Action will only occur if the drive is inactive. If the drive is active the parameter will return to its pre altered value on exit from edit mode. In mode 6 the user is free to assign the terminals as appropriate to their application.

Parameter	06.008 Hold Zero Frequency		
Short description	Set to 1 to hold the motor at zero frequency		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Hold Zero Frequency* (06.008) = 0 the sequencer state machine goes to the DISABLE state and the inverter is disabled when the Final drive run is de-activated and the motor reaches standstill.

If *Hold Zero Frequency* (06.008) = 1 and *Motor Pre-heat Current Magnitude* (06.052) = 0% the sequencer state machine goes to the STOP state when the Final drive run is de-activated and the motor reaches standstill. The drive remains enabled with a frequency reference of zero. If *Motor Pre-heat Current Magnitude* (06.052) is set to a non-zero value it defines the current in the motor when the sequencer state machine is in the STOP state. This is intended for applications where there is no motor load at standstill, but motor current is required to prevent condensation in the motor when it is stopped. If the motor is not force cooled the motor cooling is less effective at standstill than when the motor is rotating, and so care should be taken not to damage the motor by leaving it at standstill for prolonged periods with a high level of current.

When in HEAT mode i.e. *Motor Pre-heat Current Magnitude* (06.052) is non-zero value, the current used is a percentage of the motor rated current.

Parameter	06.009 <i>Catch A Spinning Motor</i>		
Short description	Defines the behaviour of the drive when the drive is enabled whilst the motor is not at zero frequency		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disable
1	Enable
2	Fwd Only
3	Rev Only

If *Catch A Spinning Motor* (06.009) = 0 the *Post Ramp Reference* (02.001) is set to zero when the drive is started. This is suitable for applications where the motor is at standstill or rotating at a low speed when the drive is enabled. However, if *Catch A Spinning Motor* (06.009) > 0 the sensorless control algorithm will pre-load the *Post Ramp Reference* (02.001) in a similar way to the Open loop mode test and give a smooth start even if the motor is already spinning. The direction of frequency detection can be restricted in the same way as for Open loop mode if *Catch A Spinning Motor* (06.009) is set to a value of 2 or 3.

If *Catch A Spinning Motor* (06.009) > 0 a test is carried out to measure the frequency of the motor when the sequencer state machine enters the RUN state. The minimum time for the test is approximately 250ms, but this may be extended as time is allowed for the motor flux to build up based on the setting of the motor parameters including *Motor Rated Speed* (05.008) which should be set to approximately the correct value. The measured frequency is used to preset the *Post Ramp Reference* (02.001) and give a smooth start even if the motor is already spinning. The test is not carried out if the Final drive run is activated when the sequencer state machine is in the STOP state. For the test to be successful it is important that the motor parameters, and especially the *Stator Resistance* (05.017), are set up correctly. For larger motors it may also be necessary for *Spin Start Boost* (05.040) to be increased from its default value of 1.0.

Restrictions can be placed on the direction of movement and the possible direction of the detected frequency as given in the table below.

<i>Catch A Spinning Motor</i> (06.009)	Function
0	Catch a spinning motor disabled
1	Detect all possible frequencies
2	Detect positive frequencies only
3	Detect negative frequencies only

Parameter	06.010 <i>Enable Conditions</i>		
Short description	Displays all the conditions needed to change the state of the final drive enable		
Mode	RFC-A		
Minimum	0 (Display: 000000000000)	Maximum	4087 (Display: 111111110111)
Default		Units	
Type	16 Bit Volatile	Update Rate	4ms
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

The Final drive enable is a combination of the *Hardware Enable* (06.029), *Drive Enable* (06.015) and other conditions that can prevent the drive from being enabled. All of these conditions are shown as bits in *Enable Conditions* (06.010) as given in the table below.

<i>Enable Conditions</i> (06.010) bits	Enable condition
0	<i>Hardware Enable</i> (06.029)
1	<i>Drive Enable</i> (06.015)
2	0 if auto tune completed or trip during auto-tune, but drive needs to be disabled and re-enabled
3	1 if fire mode is active
4	Reserved
5	Zero until the drive thermal model has obtained temperatures from all drive thermistors at least once
6	Zero until all option modules that are present in the drive have indicated that they are ready to run or the system has timed out waiting for this.
7	If an option module has forced the drive to be disabled if for example it is updating its user program.
8-10	Reserved
11	Zero if the drive is in standby mode. See <i>Standby Mode Enable</i> (06.060)

Parameter	06.011 Sequencer State Machine Inputs		
Short description	Displays the states of inputs into the sequencer state machine		
Mode	RFC-A		
Minimum	0 (Display: 0000000)	Maximum	127 (Display: 1111111)
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The bits in *Sequencer State Machine Inputs* (06.011) show the state of the inputs to the sequencer state machine as given in the tables below.

Sequencer State Machine Inputs (06.011)	Signal	Indicates
0	Final drive enable	The drive inverter is allowed to be enabled.
1	Final drive run	The motor can move away from standstill.
2	<i>Under Voltage Active</i> (10.016)	The under voltage condition has been detected.
3	<i>Zero Frequency</i> (10.003)	Indicated when the motor has stopped.
4	Drive tripped	The drive is tripped.
5	<i>Limit Switch Active</i> (10.066)	Limit switch is active
6	<i>Supply Loss</i> (10.015)	Supply loss condition has been detected.

Parameter	06.012 Enable Stop Key		
Short description	Set to 1 to enable the use of the stop key		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

The Stop key can be used to stop the drive if *Enable Stop Key* (06.012) = 1 or Keypad command is selected (see *Reference Selector* (01.014)).

If *Enable Stop Key* (06.012) = 0 and Keypad command is not selected. The Stop key is not active and can be used to initiate a drive reset and without stopping the drive from running.

If *Enable Stop Key* (06.012) = 1 or Keypad command is selected, the drive reset can be initiated without stopping the drive by holding the Run key and then pressing the Stop key.

The Stop key is also used to reset the drive from the keypad.

It should be noted that if the drive is tripped and is then reset from any source other than the keypad Stop key then the drive may start immediately under the following conditions:

1. *Enable Sequencer Latching* (06.040) = 0, the Final drive enable is active and one of the sequencer bits (*Run Forward* (06.030), *Run Reverse* (06.032) or *Run* (06.034)) is active.
2. *Enable Sequencer Latching* (06.040) = 1, the Final drive enable is active, *Not Stop* (06.039) is active and one of the sequencer bits (*Run Forward* (06.030), *Run Reverse* (06.032) or *Run* (06.034)) is active.

The drive sequencer has been designed so that pressing the Stop key, whatever the value of *Enable Stop Key* (06.012) or the Command Selection, does not make the drive state change from stopped to running. As pressing the Stop key could reset a drive trip which could then restart the drive, the run output from the sequencer is held off until the following conditions are met when the drive is tripped and the Stop key is pressed.

1. *Run Forward* (06.030) = 0 and *Run Reverse* (06.032) = 0 and *Run* (06.034) = 0*
2. OR *Run Forward* (06.030) = 1 and *Run Reverse* (06.032) = 1 for at least 60ms*
3. OR The Final drive enable = 0
4. OR The sequencer is in the UNDER_VOLTAGE state
5. OR If *Enable Sequencer Latching* (06.040) = 1, *Not Stop* (06.039) = 0

* If *Enable Sequencer Latching* (06.040) = 1 then the state of these sequencer bits must be 0 at the output of their latches.

Once the necessary conditions have been met the drive can then be restarted by activating the necessary bits for a normal start.

Parameter	06.013 Enable Auxiliary Key		
Short description	Defines the behaviour of the drive when the auxiliary button is pressed		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Forward/Reverse
2	Run Reverse

Unidrive M600-M800 remote keypad only.

If *Reference Selected Indicator* (01.049) = 4 then *Enable Auxiliary Key* (06.013) can be used to enable the Auxiliary key as a reverse key. If *Enable Auxiliary Key* (06.013) = 1 then each time the Auxiliary key is pressed *Reverse Select* (01.012) is toggled. If *Enable Auxiliary Key* (06.013) = 2 then the Auxiliary key behaves in a similar way to the Run key except that the drive runs in the reverse direction when it is pressed.

Parameter	06.014 Disable Auto Reset On Enable		
Short description	Set to 1 to disable auto reset on enable		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW		

Disable Auto Reset On Enable (06.014) will automatically reset trips on the application of an enable signal. This feature can be disabled using this parameter if *Disable Auto Reset On Enable* (06.014) = 1.

Parameter	06.015 Drive Enable		
Short description	Set to 1 to enable the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Drive Enable (06.015) must be active for the drive to be enabled. See Menu 06.

Parameter	06.016 Date		
Short description	Displays the current date		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Volatile	Update Rate	Background read/write
Display Format	Date	Decimal Places	0
Coding	RW, ND, NC, PT		

Date (06.016), *Time* (06.017) and *Day Of Week* (06.018) show the date and time as selected by *Date/Time Selector* (06.019). *Date* (06.016) stores the date in dd.mm.yy format regardless of the setting made in *Date Format* (06.020) however if the parameter is viewed using a keypad the date will be displayed in the format selected in *Date Format* (06.020). If a real time clock is selected from an option module then the days, months and years are from the real time clock and the day of the week is displayed in *Day Of Week* (06.018). Otherwise the days have a minimum value of 0 and roll over after 30, the months have a minimum value of 0 and roll over after 11, and *Day Of Week* (06.018) is always 0 (Sunday).

If when setting the date/time this parameter is being written via comms then the value should be written in standard dd/mm/yy format as described below.

The value of this parameter as seen over comms is as follows.

$$\text{Value} = (\text{day}[1..31] \times 10000) + (\text{month}[1..12] \times 100) + \text{year}[0..99]$$

Parameter	06.017 Time		
Short description	Dispals the current time		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Volatile	Update Rate	Background read/write
Display Format	Time	Decimal Places	0
Coding	RW, ND, NC, PT		

See *Date* (06.016).

The value of this parameter as seen over comms is as follows.

$$\text{Value} = (\text{hour}[0..23] \times 10000) + (\text{minute}[0..59] \times 100) + \text{seconds}[0..59]$$

Parameter	06.018 Day Of Week		
Short description	Displays the current day of the week		
Mode	RFC-A		
Minimum	0	Maximum	6
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	Sunday
1	Monday
2	Tuesday
3	Wednesday
4	Thursday
5	Friday
6	Saturday

See *Date* (06.016).

Parameter	06.019 Date/Time Selector		
Short description	Defines which clock is used to display the current time, date and day of the week		
Mode	RFC-A		
Minimum	0	Maximum	6
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Set
1	Powered
2	Running
3	Acc Powered
4	Local Keypad
5	Remote Keypad
6	Slot 1

Date/Time Selector (06.019) is used to select the drive date and time as shown in the table below.

<i>Date/Time Selector</i> (06.019)	Date/Time source
0: Set	Date and time parameters can be written by the user
1: Power	Time since the drive was powered up
2: Running	Accumulated drive running time since the drive was manufactured
3: Acc Power	Accumulated powered-up time since the drive was manufactured
4: Local Keypad	If a keypad fitted to the front of the drive includes a real-time clock then the date/time from this clock is displayed, otherwise the date/time is set to zero.
5: Remote Keypad	If a keypad connected to the user comms port (AI-485) of a drive with a 485 port includes a real-time clock then the date/time from this clock is displayed, otherwise the date/time is set to zero
6: Slot 1	As 4 above, but for option slot 1

When *Date/Time Selector* (06.019) = 0 the *Date* (06.016) and *Time* (06.017) can be written by the user and the values in these parameters are transferred to the real time clocks in the keypad or any option modules that support this feature that are fitted to the drive. When *Date/Time Selector* (06.019) is changed to any other value, the real time clocks are allowed to run normally again. When *Date/Time Selector* (06.019) is changed from any value to 0 the date and time from a real time clock, if present, is automatically loaded into *Date* (06.016) and *Time* (06.017), so that this date and time is used as the initial value for editing. If more than one real time clock is present the date/time from the remote keypad is used, if present, and if not then the date/time from the option module slot.

Date (06.016) and *Time* (06.017) are used by the timers in Menu 09 and for time stamping trips. These features will continue to use the originally selected clock even if *Date/Time Selector* (06.019) is changed until a drive reset is initiated. If *Date/Time Selector* (06.019) has been changed and a reset is initiated *Timer 1 Repeat Function* (09.039) and *Timer 2 Repeat Function* (09.049) are set to zero to disable the timers, and the trip dates and times (10.041 to 10.060) are reset to zero.

Parameter	06.020 Date Format		
Short description	Defines if the US date format is used or not		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Std	Standard date format dd.mm.yy
1	US	US date format mm.dd.yy

Date Format (06.020) selects the display style for *Date* (06.016), *Timer 1 Start Date* (09.035), *Timer 1 Stop Date* (09.037), *Timer 2 Start Date* (09.045), *Timer 2 Stop Date* (09.047) and for the trip time stamping date parameters (*Trip 0 Date* (10.041), *Trip 1 Date* (10.043), *Trip 2 Date* (10.045), *Trip 3 Date* (10.047), *Trip 4 Date* (10.049), *Trip 5 Date* (10.051), *Trip 5 Date* (10.051), *Trip 6 Date* (10.053), *Trip 7 Date* (10.055), *Trip 8 Date* (10.057), *Trip 9 Date* (10.059)) when displayed on a keypad connected to the drive. The format selection made in this parameter does not affect the value of these parameters if they are read using comms or by a user program.

If *Date Format* (06.020) is 0 then standard format is used and the date is displayed on the keypad as dd.mm.yy and if *Date Format* (06.020) is 1 then US format is used and the date is displayed on the keypad as mm.dd.yy.

Parameter	06.021 Time Between Filter Changes		
Short description	Defines the time between filter changes		
Mode	RFC-A		
Minimum	0	Maximum	30000
Default	0	Units	Hours
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Time Between Filter Changes (06.021) should be set to a non-zero value to enable the filter change timer system. Each time *Filter Change Required / Change Done* (06.022) is changed by the user from 1 to 0 the value of *Time Between Filter Changes* (06.021) is copied to *Time Before Filter Change Due* (06.023). For each hour while *Drive Active* (10.002) = 1 the *Time Before Filter Change Due* (06.023) is reduced by 1 until it reaches zero. When *Time Before Filter Change Due* (06.023) changes from 1 to 0 *Filter Change Required / Change Done* (06.022) is set to 1 to indicate that a filter change is required. The filter should be changed and the system reset again by resetting *Filter Change Required / Change Done* (06.022) to 0.

Parameter	06.022 Filter Change Required / Change Done		
Short description	Set to 0 when a filter change has taken place		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC		

See *Time Between Filter Changes* (06.021).

Parameter	06.023 Time Before Filter Change Due		
Short description	Displays the time before a filter change is required		
Mode	RFC-A		
Minimum	0	Maximum	30000
Default		Units	Hours
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Time Between Filter Changes* (06.021).

Parameter	06.024 Reset Energy Meter		
Short description	Set to 1 to reset the energy meter		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Energy Meter: MWh (06.025) and *Energy Meter: kWh* (06.026) accumulate the energy transferred through the drive. A positive energy value indicates net transfer of energy from the drive to the motor. If *Reset Energy Meter* (06.024) = 1 then *Energy Meter: MWh* (06.025) and *Energy Meter: kWh* (06.026) are held at zero. If *Reset Energy Meter* (06.024) = 0 then the energy meter is enabled and will accumulate the energy flow. If the maximum or minimum of *Energy Meter: MWh* (06.025) is reached the parameter does not rollover and is instead clamped at the maximum or minimum value.

Parameter	06.025 Energy Meter: MWh		
Short description	Displays the energy accumulated by through the drive in MWh		
Mode	RFC-A		
Minimum	-999.9	Maximum	999.9
Default		Units	MWh
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

See *Reset Energy Meter* (06.024).

Parameter	06.026 Energy Meter: kWh		
Short description	Displays the energy accumulated by through the drive in kWh		
Mode	RFC-A		
Minimum	-99.99	Maximum	99.99
Default		Units	kWh
Type	16 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *Reset Energy Meter* (06.024).

Parameter	06.027 Energy Cost Per kWh		
Short description	Defines the cost of energy per kWh		
Mode	RFC-A		
Minimum	0.0	Maximum	600.0
Default	0.0	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Running Cost (06.028) is derived from the *Output Power* (05.003) and the *Energy Cost Per kWh* (06.027) in cost per hour. The sign of *Running Cost* (06.028) is the same as the sign of *Output Power* (05.003).

Parameter	06.028 Running Cost		
Short description	Displays the running cost of the drive		
Mode	RFC-A		
Minimum	-32000	Maximum	32000
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Energy Cost Per kWh* (06.027).

Parameter	06.029 Hardware Enable		
Short description	Set to 1 to enable the hardware of the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RO, NC, BU		

Hardware Enable (06.029) normally shows the hardware enable state based on the state of the safe torque off system. However, drive I/O can be routed to *Hardware Enable* (06.029) to reduce the disable time. See description of the enable logic for more details.

Parameter	06.030 Run Forward		
Short description	Set to to give the drive a run forward signal		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If the command source is not the keypad, then *Run Forward* (06.030) can be used to make the Final drive run active and *Reverse Select* (01.012) = 0, i.e. to make the drive run in the forward direction. See description of sequencer logic for more details.

Parameter	06.031 Jog Forward		
Short description	Set to 1 to give the drive a jog forward signal		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If the command source is not the keypad, then *Jog Forward* (06.031) can be used to make the Final drive run active and *Jog Select* (01.013) = 1, i.e. to make the drive run using the jog reference and jog ramps rates. The jog function is disabled if the run is made active through the normal running sequencing bits. See description of sequencer logic for more details.

Parameter	06.032 Run Reverse		
Short description	Set to 1 to give the drive a run reverse signal		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If the command source is not the keypad, then *Run Reverse* (06.032) can be used to make the Final drive run active and *Reverse Select* (01.012) = 1, i.e. to make the drive run in the reverse direction. See description of sequencer logic for more details.

Parameter	06.033 Forward/Reverse		
Short description	Set to 1 to reverse the direction of the motor		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If the command source is not the keypad, then *Forward/Reverse* (06.033) can be used to force the state of *Reverse Select* (01.012). If *Forward/Reverse* (06.033) = 1 then *Reverse Select* (01.012) = 1. If *Forward/Reverse* (06.033) = 0 then *Reverse Select* (01.012) = 0 unless it is set to 1 by the rest of the normal run or jog logic. See description of sequencer logic for more details.

Parameter	06.034 Run		
Short description	Set to 1 to give the drive a run signal		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If the command source is not the keypad, then *Run* (06.034) can be used to make the Final drive run active, but not to affect the state of *Reverse Select* (01.012). Normally *Run* (06.034) would be used in conjunction with *Forward/Reverse* (06.033) if control of the direction is required. See description of sequencer logic for more details.

Parameter	06.035 Forward Limit Switch		
Short description	Set to 1 to activate the forward limit switch active signal and remove the Final drive run signal		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	1ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

Forward Limit Switch (06.035) and *Reverse Limit Switch* (06.036) can be used to activate the Limit switch active signal and remove the Final drive run signal. See description of sequencer logic for more details.

Condition	Forward Limit Switch (06.035)	Reverse Limit Switch (06.036)
<i>Pre-ramp Reference</i> (01.003) + * <i>Hard Frequency Reference</i> (03.022) > 0.00	Active	Not active
<i>Pre-ramp Reference</i> (01.003) + * <i>Hard Frequency Reference</i> (03.022)	Not active	Active
<i>Pre-ramp Reference</i> (01.003) + * <i>Hard Frequency Reference</i> (03.022) = 0.00	Active	Active

* If *Hard Frequency Reference Select* (03.023) = 0 then the *Hard Frequency Reference* (03.022) is taken as 0

Open loop mode

Normally digital input destinations are routed to *Forward Limit Switch* (06.035) and *Reverse Limit Switch* (06.036) to activate the limit switch system. If a digital input that is integral to the drive is used then Limit switch active will follow the state of the input with a maximum delay of approximately 2.5ms. If Limit switch active becomes active the motor is stopped using the currently selected ramp rate. The limit switches are direction dependant, so that the motor can rotate in a direction that allows the system to move away from the limit switch.

RFC modes

Forward Limit Switch (06.035) and *Reverse Limit Switch* (06.036) operate in a similar way to RFC-A mode when Limit switch active becomes active. If *Limit Switch Stop Mode* (06.002) = 0 the motor is stopped without ramps, otherwise it is stopped with the currently selected ramp rate. If a digital input that is integral to the drive is used the maximum delay is approximately TBA. The limit switches are direction dependant, so that the motor can rotate in a direction that allows the system to move away from the limit switch.

Parameter	06.036 Reverse Limit Switch		
Short description	Set to 1 to activate the reverse limit switch active signal and remove the Final drive run signal		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	1ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Forward Limit Switch* (06.035).

Parameter	06.037 Jog Reverse		
Short description	Set to 1 to give the drive a jog reverse signal		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If the command source is not the keypad, then *Jog Reverse* (06.037) can be used to make the Final drive run active, *Jog Select* (01.013) = 1 and *Reverse Select* (01.012) = 1, i.e. to make the drive run using the jog reference and jog ramps rates in the reverse direction. The jog function is disabled if the run is made active through the normal running sequencing bits. See description of sequencer logic for more details.

Parameter	06.038 User Enable		
Short description	Set to 1 to reset the latched sequencer bits if sequencer latching is enabled		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

This parameter is ANDed with the STO logic to produce the combined *Hardware Enable* (06.029). A user must set this parameter as a destination from a digital input. The logic value of this parameter will be set to 1 if it has not been used as a destination which will permit the STO to solely control the *Hardware Enable* (06.029).

Parameter	06.039 Not Stop		
Short description	Set to 1 to reset the latched sequencer bits if sequencer latching is enabled		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Enable Sequencer Latching* (06.040) = 1 then the sequencer bits can be latched. *Not Stop* (06.039) should be used to reset the latched sequencer bits. If *Not Stop* (06.039) = 1 then the sequencer bits can be latched. If *Not Stop* (06.039) = 0 then the latches are cleared and their outputs are forced to zero which will de-activate the Final drive run. See description of sequencer logic for more details.

Parameter	06.040 Enable Sequencer Latching		
Short description	Set to 1 to enable sequencer latching		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Not Stop* (06.039).

Parameter	06.041 Drive Event Flags		
Short description	Displays if certain actions have occurred within the drive		
Mode	RFC-A		
Minimum	0 (Display: 00)	Maximum	3 (Display: 11)
Default	0 (Display: 00)	Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RW, NC		

Drive Event Flags (06.041) indicates that certain actions have occurred within the drive as described below.

Bit	Corresponding event
0	Defaults loaded
1	Drive mode changed

Bit 0: Defaults loaded

The drive sets bit 0 when defaults have been loaded and the associated parameter save has been completed. The drive does not reset this flag except at power-up.

Bit 1: Drive mode changed

The drive sets bit 1 when the drive mode has changed and the associated parameter save has been completed. The drive does not reset this flag except at power-up.

Parameter	06.042 Control Word		
Short description	Controls the sequencer state machine inputs if the control word is enabled		
Mode	RFC-A		
Minimum	0 (Display: 0000000000000000)	Maximum	32767 (Display: 1111111111111111)
Default	0 (Display: 0000000000000000)	Units	
Type	16 Bit Volatile	Update Rate	Bits 9,7-0: 16ms, Other bits: Background read
Display Format	Binary	Decimal Places	0
Coding	RW, NC		

If *Control Word Enable* (06.043) = 0 then *Control Word* (06.042) has no effect. If *Control Word Enable* (06.043) = 1 the bits in *Control Word* (06.042) are used instead of their corresponding parameters or to initiate drive functions as shown in the table below.

Bit	Corresponding parameter or function
0	<i>Drive Enable</i> (06.015)
1	<i>Run Forward</i> (06.030)
2	<i>Jog Forward</i> (06.031)
3	<i>Run Reverse</i> (06.032)
4	<i>Forward/Reverse</i> (06.033)
5	<i>Run</i> (06.034)
6	<i>Not Stop</i> (06.039)
7	Auto / manual
8	Analog / Preset reference
9	<i>Jog Reverse</i> (06.037)
10	Not used
11	Not used
12	Trip drive
13	Reset drive
14	Watchdog

Bits 0-7 and bit 9: Sequencer control

When Auto/manual bit (bit7) = 1 then bits 0 to 6 and bit 9 of the *Control Word* (06.042) become active. The equivalent parameters are not modified by these bits, but become inactive when the equivalent bits in the *Control Word* (06.042) are active. When the bits are active they replace the functions of the equivalent parameters.

Bit 8: Analogue/preset reference

The state of Analogue/Preset Reference (bit 8) is written continuously to *Reference Select Flag 2* (01.042). With default drive settings (i.e. *Reference Selector* (01.014) = 0) this selects *Analog Reference 1* (01.036) when bit 8 = 0 or *Preset Reference 1* (01.021) when bit8 = 1. If any other drive parameters are routed to *Reference Select Flag 2* (01.042) the value of this parameter is undefined.

Bit 10 and bit 11: Not used

The values of these bits have no effect on the drive.

Bit 12: Trip drive

If bit 12 = 1 then a *Control Word* trip is repeatedly initiated. The trip cannot be cleared until bit 12 = 0.

Bit 13: Reset drive

If bit 13 is changed from 0 to 1 a drive reset is initiated. Bit 13 does not modify *Drive Reset* (10.033).

Bit 14: Watchdog

A watchdog system can be enabled or serviced each time bit 14 is changed from 0 to 1. Once bit 14 has been changed from 0 to 1 to enable the watchdog, this must be repeated every 1s or else a *Watchdog* trip will be initiated. The watchdog is disabled when the trip occurs and must be re-enabled if required when the trip is reset.

Parameter	06.043 Control Word Enable		
Short description	Set to 1 to enable the control word		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Control Word* (06.042).

Parameter	06.045 Cooling Fan control		
Short description	Defines the maximum speed of the drive cooling fan		
Mode	RFC-A		
Minimum	0	Maximum	5
Default	2	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Cooling Fan control* (06.045) = 0 the cooling fan in the drive are off.

- If an option module is fitted, the drive might trip *O/Ht Control* if *Stack Temperature* (07.004) is above a set threshold and the option module will be forced to go to standby.
- If an option module is fitted, the cooling fan might go to low speed in certain conditions.

If *Cooling Fan control* (06.045) = 1 the cooling fan in the drive are all forced to run at full speed.

If *Cooling Fan control* (06.045) = 2 the cooling fan in the drive is controlled by the value of *Stack Temperature* (07.004). The fan run at full speed. for at least 20 seconds if *Stack Temperature* (07.004) is greater than a frame dependent threshold (60 °C for size 1 & 2 or 50 °C for size 3 & 4) or *Current Magnitude* (04.001) is greater than 75% of *Drive current rating* (11.068) otherwise the cooling fan is off. If the cooling fan is off, it might go to low speed if the control board temperature is too high.

If *Cooling Fan control* (06.045) = 3 is the same as *Cooling Fan control* (06.045) = 2 but the cooling fan never turns off but runs at low speed continuously.

If *Cooling Fan control* (06.045) = 4 the cooling fan in the drive is at low speed continuously.

If *Cooling Fan control* (06.045) = 5 is the same as *Cooling Fan control* (06.045) = 2 but with lower threshold using minimum speed - "theatre mode".

Note: Size 1 drives only have single fan speed

Parameter	06.046 Supply Loss Hold Disable		
Short description	Set to 1 to disable supply loss hold		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Frame sizes 06 and below

Supply Loss Hold Disable (06.046) has no effect.

Frame sizes 07 and above

When leaving the supply loss ride through condition the control system does not apply any motoring load until the d.c. link change system is fully inactive. This prevents a dip in the d.c. link voltage that would occur if the load is applied before the thyristor rectifier in the charge system is fully phased forwards. If the d.c. link is not supplied via its own input rectifier then it is necessary to set *Supply Loss Hold Disable* (06.046) = 1 to disable this feature.

Parameter	06.047 Input Phase Loss Detection Mode		
Short description	Defines how the input phase loss is detected		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Full
1	Ripple Only
2	Disabled

Input phase loss is detected by monitoring the d.c. link voltage ripple which increases with load. When compared to normal operation, if an input phase is missing or there is excessive input phase imbalance the d.c. link ripple level is higher. The high ripple level is detected to initiate a *PH.Lo* trip. For drive sizes 8 and above and above additional input phase loss detection is provided by direct monitoring of the supply voltages (*PH.Lo* trip). Unlike the d.c. voltage ripple based detection which can only operate when the drive is enabled and on load, the additional input phase loss detection can operate whether the drive is enabled or not. *Input Phase Loss Detection Mode* (06.047) defines the methods used for input phase loss detection provided by the drive.

Input Phase Loss Detection Mode (06.047)	Drive Active (10.002) = 0	Drive Active (10.002) = 1
0	*Direct input phase loss detection	*Direct input phase loss detection D.c. link voltage ripple detection
1	*Direct input phase loss detection	D.c. link voltage ripple detection
2	No input phase loss detection	No input phase loss detection

*Frame sizes 8 and above

Input phase loss detection can be disabled when the drive is required to operate from a d.c. supply connected to the d.c. link or from a single phase supply. If the drive operates from a single phase supply or a supply with high levels of phase imbalance under load the input stage and d.c. link thermal protection system may produce a *OHT dc bus* trip.

Parameter	06.048 Supply Loss Detection Level		
Short description	Defines the threshold for indicating when the supply loss condition is detected		
Mode	RFC-A		
Minimum	0	Maximum	VM_SUPPLY_LOSS_LEVEL
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Default Value
110V	205
200V	205
400V	410
575V	540
690V	540

Defines the threshold for indicating when the supply loss condition is detected.

The threshold can be adjusted using this parameter. If the value is reduced below the default value the default value is used by the drive. If the level is set too high so that supply loss detection becomes active under normal operating conditions, the motor will coast to a stop.

Parameter	06.051 Hold Supply Loss Active		
Short description	Hold Supply Loss Active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	1ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If supply loss is detected (i.e. *Supply Loss* (10.015) = 1) or *Hold Supply Loss Active* (06.051) = 1 the supply loss indication and the action taken on supply loss will be active. For example, *Hold Supply Loss Active* (06.051) can be controlled by an external rectifier or a Regen system (via a digital input) to prevent power from being taken from the supply if supply loss ride-through mode is being used until the input system is ready to provide power. This can allow for the charge system in an external rectifier to complete the charging, or it can allow a Regen system to become synchronised.

Parameter	06.052 Motor Pre-heat Current Magnitude		
Short description	Defines the current in the motor when the state machine is in the stop state		
Mode	RFC-A		
Minimum	0	Maximum	100
Default	0	Units	%
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Hold Zero Frequency* (06.008).

Parameter	06.058 Output Phase Loss Detection Time		
Short description	Output Phase Loss Detection Time		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	0.5s
1	1.0s
2	2.0s
3	4.0s

See *Output Phase Loss Detection Enable* (06.059).

Parameter	06.059 Output Phase Loss Detection Enable		
Short description	Set to 1 to enable output phase loss detection		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Output phase loss detection can be used to detect a disconnected motor phase if *Output Phase Loss Detection Enable* (06.059) is set to a non-zero value.

0: Disabled

Output phase loss detection is not active.

1: Enabled

A test is carried out each time the drive is enabled to run to check if all three phases are connected. If the test fails a *Out Phase Loss.X* trip is initiated where X indicates which phase is not connected (1 = U, 2 = V, 3 = W). It should be noted that this test is not carried out in Open-loop mode if "catch a spinning motor is enabled (i.e. *Catch A Spinning Motor* (06.009) > 0).

For Open-loop and RFC-A modes a test is also carried out while the drive is running. If the drive output frequency is above 4Hz and a phase is disconnected for the time specified by *Output Phase Loss Detection Time* (06.058) then a *Out Phase Loss.4* trip is initiated. It should be noted that if the motor is operating at high speed and flux weakening is active so that the magnetising current is below half the rated level then output phase loss will not be detected. If the motor is heavily loaded when a phase is disconnected it is likely that the motor will stall and the drive output frequency may fall below 4Hz before output phase loss is detected.

Parameter	06.060 Standby Mode Enable		
Short description	Set to 1 enable standby mode		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Standby Mode Enable* (06.060) = 1 then the drive will go into the standby power state 20 seconds after the last key press and whenever *Drive Active* (10.002) = 0. In this state the LED on the front of the drive flashes 0.25s on and 2s off. And the following actions are taken as defined by the *Standby Mode Mask* (06.061). Actions are enabled by setting the appropriate bit to 1.

Standby Mode Mask (06.061) bits	Action
0	NA
1	Instruct all keypads to go into their standby state
2	NA
3	Instruct the option module in option slot 1 to go into the standby power state

Parameter	06.061 Standby Mode Mask		
Short description	Defines the behaviour of standby mode		
Mode	RFC-A		
Minimum	0 (Display: 0000)	Maximum	15 (Display: 1111)
Default	0 (Display: 0000)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW		

See *Standby Mode Enable* (06.060).

Parameter	06.071 Slow Rectifier Charge Rate Enable		
Short description	Set to 1 to reduce the charge rate of the d.c. bus		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

For Frame size 07 and larger, which use a d.c. link charge system based on a half controlled thyristor input bridge, the rate at which the d.c. link is charged can be reduced by setting *Slow Rectifier Charge Rate Enable* (06.071) to one. This will reduce the charging current which may be required if significant additional capacitance is added to the d.c. link to prevent rupturing of input fuses.

Parameter	06.073 Braking IGBT Lower Threshold		
Short description	Defines the lowest level of the d.c. bus voltage where the braking IGBT becomes active		
Mode	RFC-A		
Minimum	-VM_DC_VOLTAGE_SET	Maximum	VM_DC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Default Value
110V	390
200V	390
400V	780
575V	930
690V	1120

Braking IGBT Lower Threshold (06.073) defines the lowest level of *D.c. Link Voltage* (05.005) where the braking IGBT will become active and *Braking IGBT Upper Threshold* (06.074) defines the level of *D.c. Link Voltage* (05.005) where the braking IGBT will be on continuously. When the braking IGBT is turned on it will remain on for at least 1ms. The braking IGBT on-time is defined by the thresholds and the d.c. link voltage as given in the table below where L = *Braking IGBT Lower Threshold* (06.073) and U = *Braking IGBT Upper Threshold* (06.074).

D.c. link voltage level	On-time
<i>D.c. Link Voltage</i> (05.005)	0%
$L \leq \text{D.c. Link Voltage (05.005)}$	$[(\text{D.c. Link Voltage (05.005)} - L) / (U - L)] \times 100\%$
$\text{D.c. Link Voltage (05.005)} \geq U$	100%

As the *D.c. Link Voltage* (05.005) rises above the lower threshold the braking IGBT is active with an on/off ratio of 1/100. As the voltage rises further, the on/off ratio increases until at the upper threshold the braking IGBT is on continuously. The upper and lower voltage threshold can be set up so that braking resistors in drives with parallel connected d.c. links will share the braking load.

If *Braking IGBT Lower Threshold* (06.073) \geq *Braking IGBT Upper Threshold* (06.074) then the braking IGBT is off when *D.c. Link Voltage* (05.005) \geq *Braking IGBT Upper Threshold* (06.074) and on if *D.c. Link Voltage* (05.005) \geq *Braking IGBT Upper Threshold* (06.074). This method of control is the same as that used in Commander SK and the default values for the braking thresholds are equal to the braking thresholds in Commander SK.

Unless sharing between braking resistors is required the braking thresholds do not normally need to be adjusted. Care should be taken when reducing the thresholds because if either threshold is below the maximum value of the peak rectified supply voltage the braking resistor could take power from the supply.

The list below gives conditions that will disable the braking IGBT:

1. *Braking IGBT Upper Threshold* (06.074) = 0, or *Low Voltage Braking IGBT Threshold Select* (06.076) = 1 and *Low Voltage Braking IGBT Threshold* (06.075) = 0.
2. The drive is in the under-voltage state.
3. A priority 1, 2 or 3 trip is active.
4. There is a fault in the control system power supply.
5. The hardware or software over-temperature systems indicate that the braking resistor is too hot.
6. A braking IGBT over-current trip is active *OI Brake*.

Parameter	06.074 Braking IGBT Upper Threshold		
Short description	Defines the level of the d.c. bus voltage where the braking IGBT will be on continuously		
Mode	RFC-A		
Minimum	-VM_DC_VOLTAGE_SET	Maximum	VM_DC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Default Value
110V	390
200V	390
400V	780
575V	930
690V	1120

See *Braking IGBT Lower Threshold* (06.073).

Parameter	06.075 Low Voltage Braking IGBT Threshold		
Short description	Defines the threshold used for low voltage braking		
Mode	RFC-A		
Minimum	-VM_DC_VOLTAGE_SET	Maximum	VM_DC_VOLTAGE_SET
Default	0	Units	V
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

If *Low Voltage Braking IGBT Threshold Select* (06.076) = 0 the normal thresholds are used. If *Low Voltage Braking IGBT Threshold Select* (06.076) = 1 then *Low Voltage Braking IGBT Threshold* (06.075) is used, so that the braking IGBT is on with a minimum on time of 1ms if the d.c. link voltage is above this level, or off if the d.c. link voltage is below this level.

Parameter	06.076 Low Voltage Braking IGBT Threshold Select		
Short description	Set to 1 enable low voltage IGBT braking		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Low Voltage Braking IGBT Threshold* (06.075)

Parameter	06.077 Low DC Link Operation		
Short description	Set to 1 to allow a 400V drive to be ran from a 240V supply		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

On the 400V product setting this bit will enable the drive to run from a 240VAC input. Low DC Link Operation is enabled when *Low DC Link Operation* (06.077) is set to one. See figure below.

Low AC Alarm (10.107) is displayed from step 2 on the graph above.

The functionality described for *Low DC Link Operation* (06.077) is supported across Frames 02-09. For Frames 05 and above, the minimum supply voltage supported is 330V DC (233VAC RMS)

Parameter	06.084 UTC Offset		
Short description	UTC Offset		
Mode	RFC-A		
Minimum	-24.00	Maximum	24.00
Default	0.00	Units	Hours
Type	16 Bit User Save	Update Rate	Background Read
Display Format	Standard	Decimal Places	2
Coding	RW		

UTC Offset (06.084) is an offset, specified in hours, applied to the selected clock source (see *Date/Time Selector* (06.019)). This could be used for time zone offsets etc. The offset will be applied to the time obtained from the selected clock source, in addition to any offset already applied to the time from that source.

Mode: RFC-A

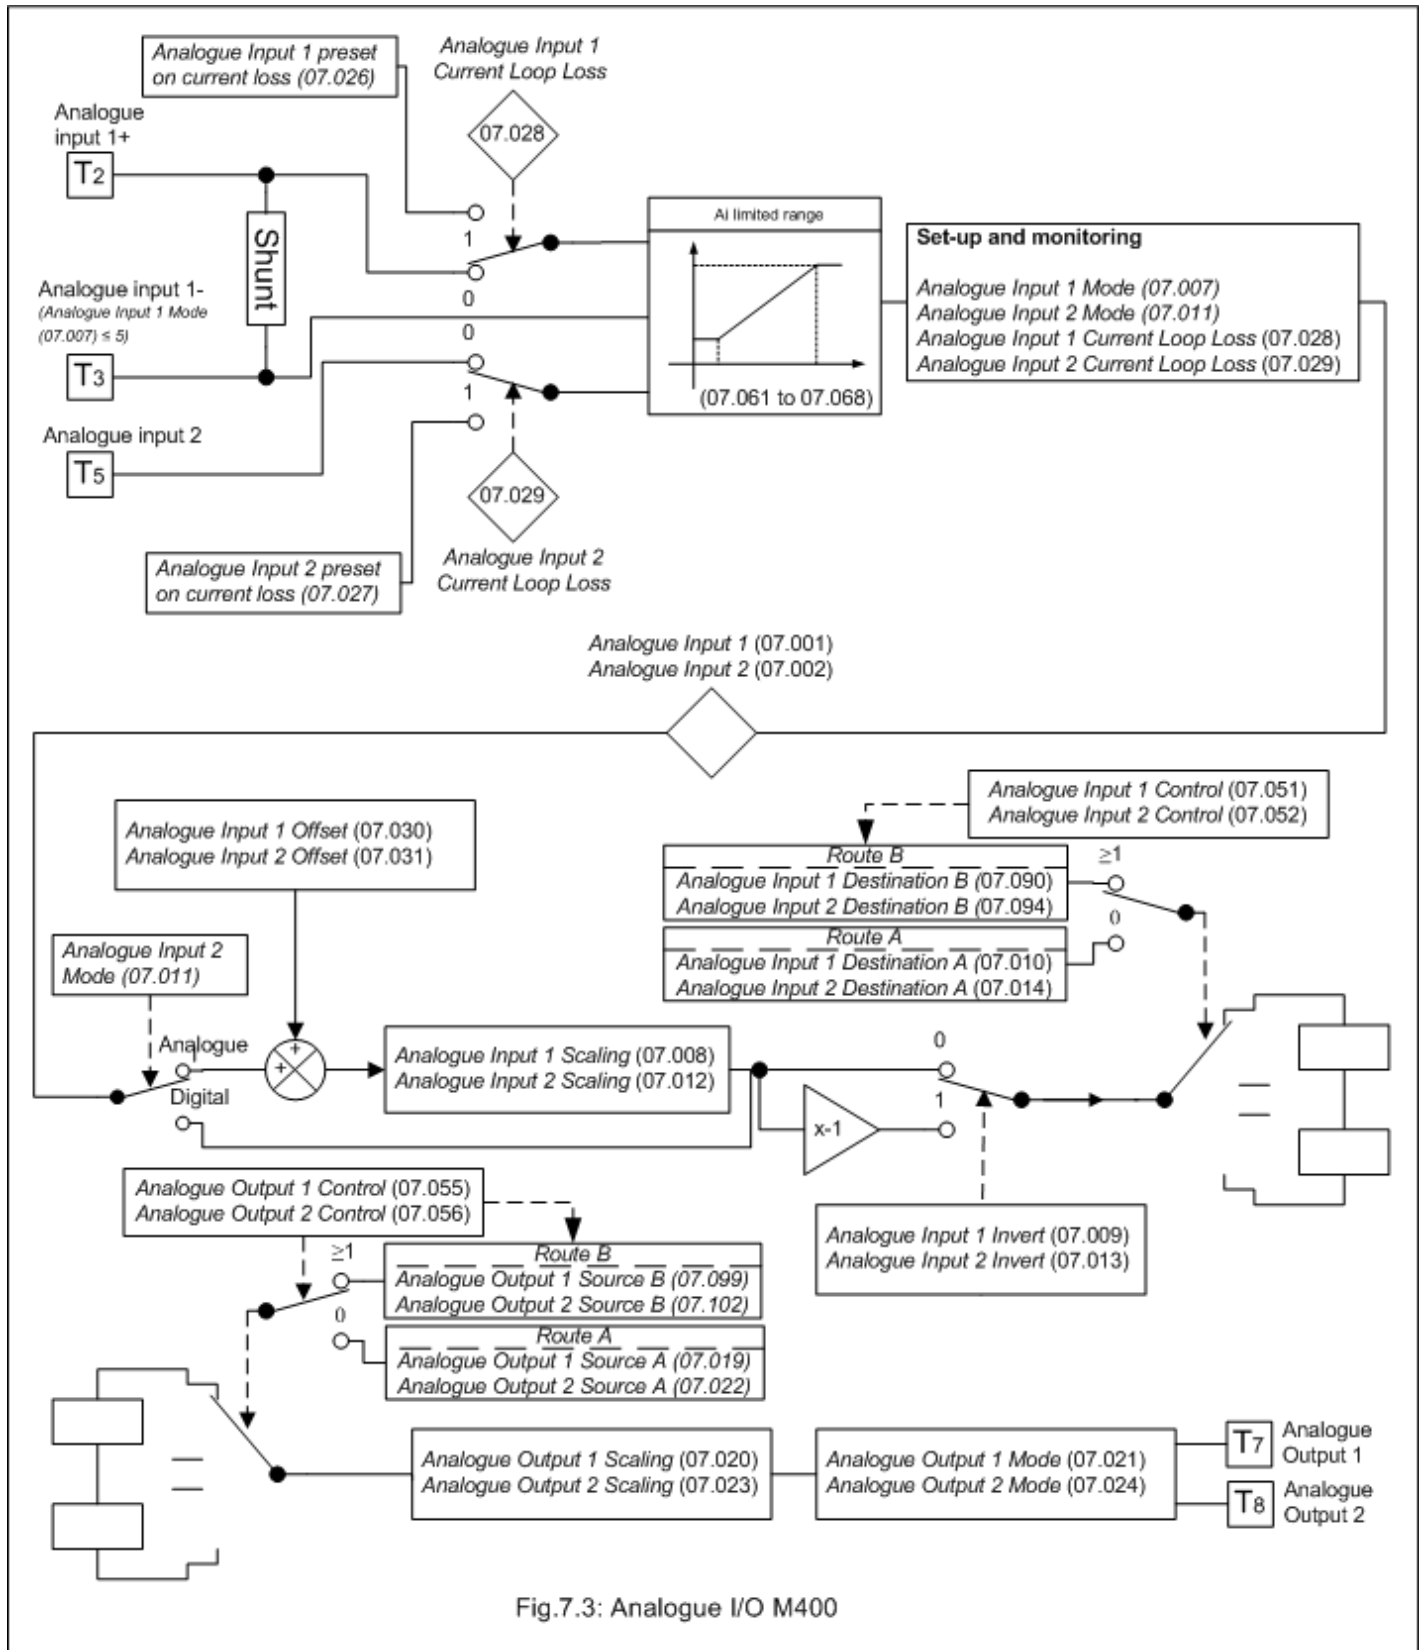

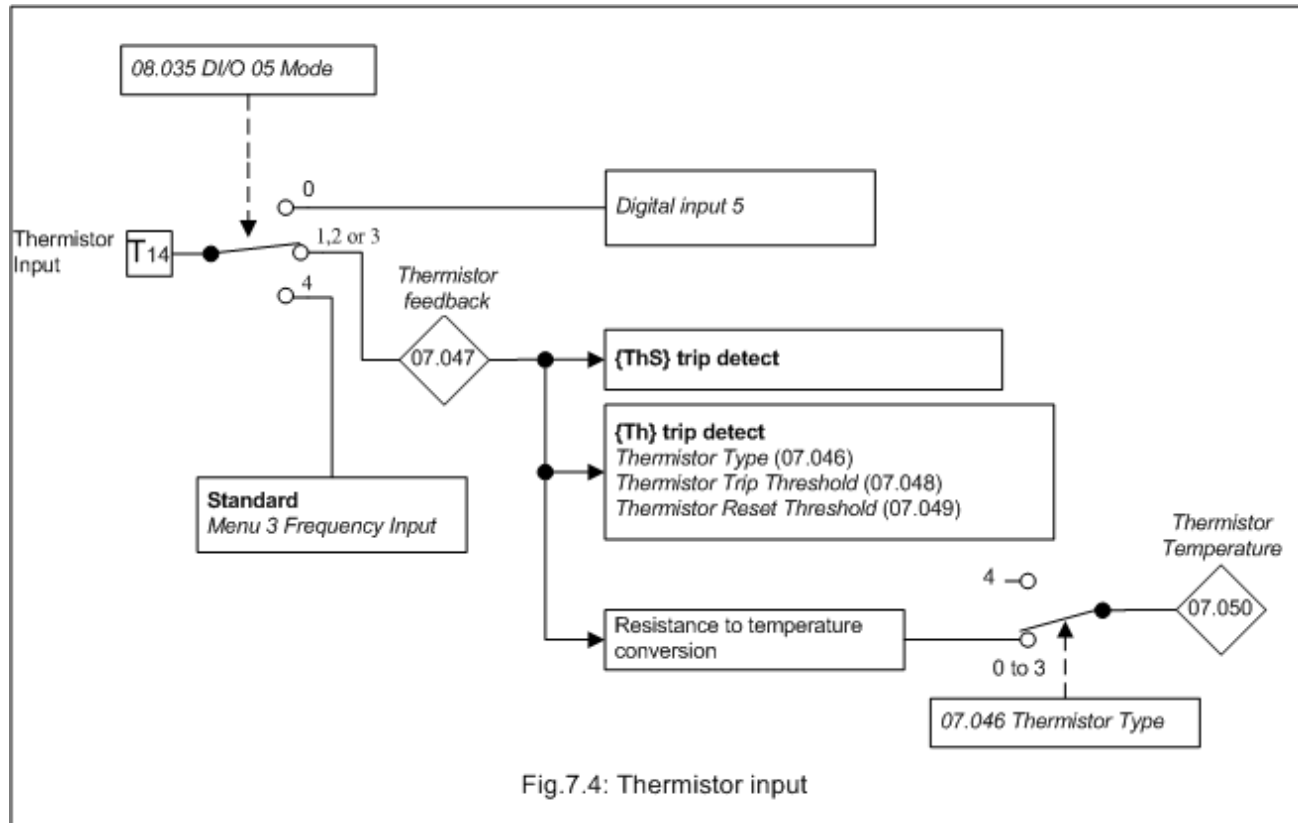

Fig.7.3: Analogue I/O M400

Thermistor Input

Drive thermal monitoring

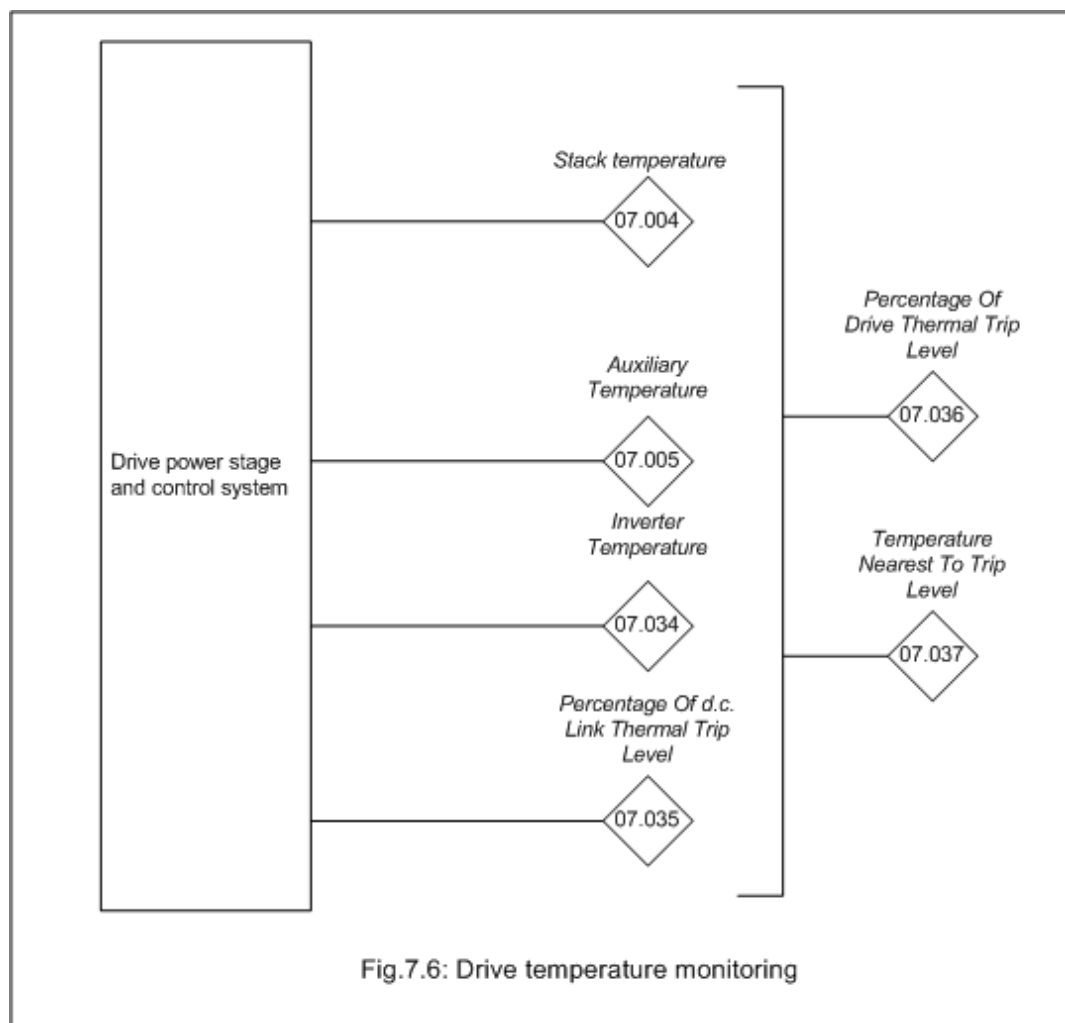

Fig.7.6: Drive temperature monitoring

Parameter	07.001 Analogue Input 1		
Short description	Displays the value of analog input 1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, ND, NC, PT		

The Analog input 1 can operate in different modes as defined by *Analogue Input 1 Mode* (07.007) including current modes. See *Analog I/O*.

Voltage mode: Resolution of 12 bits (11 bits + sign). It is a single ended bipolar voltage input +/-10V

Current mode: Resolution of 11 bits. It is a differential unipolar current through input 0-20mA (burden in series)

The "Input Level" is defined for the different modes in the table below.

Mode	Input Level
Voltage	$(\text{Input Voltage} / 10\text{V}) \times 100.00\%$
0-20mA	$(\text{Input Current} / 20\text{mA}) \times 100.00\%$
20-0mA	$(20\text{mA} - \text{Input Current}) / 20\text{mA} \times 100.00\%$
4-20mA	$(\text{Input Current} - 4\text{mA}) / 16\text{mA} \times 100.00\%$
20-4mA	$(20\text{mA} - \text{Input Current}) / 16\text{mA} \times 100.00\%$

Parameter	07.002 Analogue Input 2		
Short description	Displays the value of analog input 2		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms
Display Format	Standard	Decimal Places	2
Coding	RO, FI, ND, NC, PT		

See *Analog I/O*.

Voltage mode: This input is a unipolar voltage 0-10V.

Digital mode: This input can also be configured as a digital input in which case this parameter will indicate 0.00% or 100.00% depending on the state of the input.

Current mode: This input can be a single ended unipolar current input 0-20mA.

The "Input Level" is defined for the different modes in the table below.

Mode	Input Level
Voltage	$(\text{Input Voltage} / 10\text{V}) \times 100.00\%$
0-20mA	$(\text{Input Current} / 20\text{mA}) \times 100.00\%$
20-0mA	$(20\text{mA} - \text{Input Current}) / 20\text{mA} \times 100.00\%$
4-20mA	$(\text{Input Current} - 4\text{mA}) / 16\text{mA} \times 100.00\%$
20-4mA	$(20\text{mA} - \text{Input Current}) / 16\text{mA} \times 100.00\%$
Digital	0.00% (corresponds to logical 0 if less than 9V) or 100.0% (corresponds to logical 1 if more than 11V)

Parameter	07.004 Stack Temperature		
Short description	Displays the temperature currently being measured on the heat sink		
Mode	RFC-A		
Minimum	-250	Maximum	250
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

This parameter displays the temperature currently being measured on the heat sink. This is used as part of the drive thermal model, see *Drive Over-temperature Alarm* (10.018) for further details.

Parameter	07.005 Auxiliary Temperature		
Short description	Displays the temperature currently being measured on the power system		
Mode	RFC-A		
Minimum	-250	Maximum	250
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

This parameter displays the temperature currently being measured on the power system on large frame. This is used as part of the drive thermal model.

Parameter	07.007 Analogue Input 1 Mode		
Short description	Defines the mode of analog input 1		
Mode	RFC-A		
Minimum	-6	Maximum	6
Default	6	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
-6	4-20mA Stop
-5	20-4mA Stop
-4	4-20mA Low
-3	20-4mA Low
-2	4-20mA Hold
-1	20-4mA Hold
0	0-20mA
1	20-0mA
2	4-20mA Trp
3	20-4mA Trp
4	4-20mA
5	20-4mA
6	Voltage

See *Analogue Input 1* (07.001).

The table below gives all the possible analogue input modes.

Value	Mode	Function
-6	4-20mA Stop	Stop on loss
-5	20-4mA Stop	Stop on loss
-4	4-20mA Low	4-20mA switching to equivalent of 4mA input current on loss(1). See <i>Analogue Input 1 Preset on Current Loss</i> (07.026).
-3	20-4mA Low	20-4mA switching to equivalent of 4mA input current on loss(1). See <i>Analogue Input 1 Preset on Current Loss</i> (07.026)
-2	4-20mA Hold	4-20mA hold at level before loss on current loss (2)
-1	20-4mA Hold	20-4mA hold at level before loss on current loss (2)
0	0-20mA	0-20mA
1	20-0mA	20-0mA
2	4-20mA Trip	4-20mA trip on current loss (1), (3)
3	20-4mA Trip	20-4mA trip on current loss (1), (3)
4	4-20mA	4-20mA no action on loss (1)
5	20-4mA	20-4mA no action on loss (1)
6	Voltage	Voltage

(1) Analogue input level is 0.00% if the current is below 3mA.

(2) Analogue input level remains at the value it had in the previous sample before the current fell below 3mA.

(3) A *An Input 1 Loss* is initiated if the current falls below 3mA.

Parameter	07.008 Analogue Input 1 Scaling		
Short description	Defines the scaling factor of analog input 1		
Mode	RFC-A		
Minimum	0.000	Maximum	10.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Analogue I/O*.

Analogue Input 1 (07.001) is modified by *Analogue Input 1 Scaling* (07.008), *Analogue Input 1 Offset* (07.030) and *Analogue Input 1 Invert* (07.009) before it is routed to its destination as follows:

$$A_{10} = \text{Analogue Input 1 (07.001)} + \text{Analogue Input 1 Offset (07.030)}$$

A_{10} is the value after the offset has been applied and is limited between -100.00% and 100.00%

$$A_{1S} = A_{10} \times \text{Analogue Input 1 Scaling (07.008)}$$

A_{1S} is the value after the scaling and the offset have been applied and is limited between -100.00% and 100.00%

If *Analogue Input 1 Invert* (07.009) = 0 then $A_{1I} = A_{1S}$ otherwise $A_{1I} = -A_{1S}$

A_{1I} is the value after the invert, scaling and offset have been applied and is the final value that is routed to the destination defined by

- *Analogue Input 1 Destination A* (07.010) if *Analogue Input 1 Control* (07.051) = 0
- *Analogue Input 1 Destination B* (07.090) if *Analogue Input 1 Control* (07.051) > 0

Parameter	07.009 <i>Analogue Input 1 Invert</i>		
Short description	Inverts the signal for analog input 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Analogue Input 1 Scaling* (07.008).

Parameter	07.010 <i>Analogue Input 1 Destination A</i>		
Short description	Defines the output parameter for analog input 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.036	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

See *Analogue Input 1 Scaling* (07.008).

Parameter	07.011 <i>Analogue Input 2 Mode</i>		
Short description	Defines the mode for analog input 2		
Mode	RFC-A		
Minimum	-6	Maximum	7
Default	6	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
-6	4-20mA Stop
-5	20-4mA Stop
-4	4-20mA Low
-3	20-4mA Low
-2	4-20mA Hold
-1	20-4mA Hold
0	0-20mA
1	20-0mA
2	4-20mA Trp
3	20-4mA Trp
4	4-20mA
5	20-4mA
6	Voltage
7	Digital

See *Analogue Input 2* (07.002).

The table below gives all the possible analogue input modes.

Value	Mode	Function
-6	4-20mA Stop	Stop on loss
-5	20-4mA Stop	Stop on loss
-4	4-20mA Low	4-20mA switching to equivalent of 4mA input current on loss(1). See <i>Analog Input 2 Preset on Current Loss (07.027)</i> .
-3	20-4mA Low	20-4mA switching to equivalent of 4mA input current on loss(1). See <i>Analog Input 2 Preset on Current Loss (07.027)</i> .
-2	4-20mA Hold	4-20mA hold at level before loss on current loss (2)
-1	20-4mA Hold	20-4mA hold at level before loss on current loss (2)
0	0-20mA	0-20mA
1	20-0mA	20-0mA
2	4-20mA Trip	4-20mA trip on current loss (1), (3)
3	20-4mA Trip	20-4mA trip on current loss (1), (3)
4	4-20mA	4-20mA no action on loss (1)
5	20-4mA	20-4mA no action on loss (1)
6	Voltage	Voltage
7	Digital	Digital

(1) Analogue input level is 0.00% if the current is below 3mA.

(2) Analogue input level remains at the value it had in the previous sample before the current fell below 3mA.

(3) A *An Input 2 Loss* is initiated if the current falls below 3mA.

Parameter	07.012 Analogue Input 2 Scaling		
Short description	Defines the scaling factor for analog input 2		
Mode	RFC-A		
Minimum	0.000	Maximum	10.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Analog I/O*.

Analogue Input 2 (07.002) is modified by *Analogue Input 2 Scaling (07.012)*, *Analogue Input 2 Offset (07.031)* and *Analogue Input 2 Invert (07.013)* before it is routed to its destination as follows:

$$A_{20} = \text{Analogue Input 2 (07.002)} + \text{Analogue Input 2 Offset (07.031)}$$

A_{20} is the value after the offset has been applied and is limited between 0.00% and 100.00%

$$A_{2S} = A_{20} \times \text{Analogue Input 2 Scaling (07.012)}$$

A_{2S} is the value after the scaling and the offset have been applied and is limited between 0.00% and 100.00%

If *Analogue Input 2 Invert (07.013)* = 0 then $A_{21} = A_{2S}$ otherwise $A_{21} = -A_{2S}$

A_{21} is the value after the invert, scaling and offset have been applied and is the final value that is routed to the destination defined by

- *Analogue Input 2 Destination A (07.014)* if *Analogue Input 2 Control (07.052)* = 0
- *Analogue Input 2 Destination B (07.094)* if *Analogue Input 2 Control (07.052)* > 0

Parameter	07.013 Analogue Input 2 Invert		
Short description	Inverts the signal for analog input 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Analogue Input 2 Scaling (07.012)*.

Parameter	07.014 Analogue Input 2 Destination A		
Short description	Defines the output parameter for analog input 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.037	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

See *Analogue Input 2 Scaling* (07.012).

Parameter	07.019 Analogue Output 1 Source A		
Short description	Defines the input parameter for analog output 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	2.001	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT		

Analogue Output 1 Source A (07.019) defines the source parameter for Analogue Output 1. The value is then scaled with *Analogue Output 1 Scaling* (07.020) and if the scaling is greater than 1.000 the value is clamped between -100.0% and +100.0% which corresponds to:

M200, M201, M300:

- In voltage mode: 0V to +10V

M400:

- In voltage mode: 0V to +10V
- In current mode: 4-20mA or 0-20mA depending on the mode selected
- In digital mode: 0V to +24V. Scaling parameter has no effect.
 - If source is a bit parameter then "Off" gives 0V and "On" gives +24V
 - If source is not a bit parameter then source parameter must be more than half its positive range to be +24V.

Parameter	07.020 Analogue Output 1 Scaling		
Short description	Defines the scaling factor for analog output 1		
Mode	RFC-A		
Minimum	0.000	Maximum	40.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, BU		

See *Analogue Output 1 Source A* (07.019).

Parameter	07.021 Analogue Output 1 Mode		
Short description	Defines the mode of analog output 1		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Voltage
1	0-20mA
2	4-20mA
3	Digital

The table above gives all possible analogue output 1 modes.

Parameter	07.022 Analogue Output 2 Source A		
Short description	Defines the input source for analog output 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	4.002	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT		

Analogue output 2 operates in the same way as analogue output 1. See *Analogue Output 1 Source A* (07.019).

Parameter	07.023 Analogue Output 2 Scaling		
Short description	Defines the scaling factor for analog output 2		
Mode	RFC-A		
Minimum	0.000	Maximum	40.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, BU		

Analogue output 2 operates in the same way as analogue output 1. See *Analogue Output 1 Source A* (07.019).

Parameter	07.024 Analogue Output 2 Mode		
Short description	Defines the mode of analog output 2		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Voltage
1	0-20mA
2	4-20mA
3	Digital

The table above gives all possible analogue output 2 modes.

Parameter	07.026 Analog Input 1 Preset on Current Loss		
Short description	Defines the current level held on analogue input 1 current loss		
Mode	RFC-A		
Minimum	4.00	Maximum	20.00
Default	4.00	Units	mA
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

If *Analogue Input 1 Mode* (07.007) is set to any of the *4-20mA Low* or *20-4mA Low* modes and the current falls below 3mA (*Analogue Input 1 Current Loop Loss* (07.028) = 1) then the analogue input 1 is held to *Analog Input 1 Preset on Current Loss* (07.026).

If the current rise above 4mA (*Analogue Input 1 Current Loop Loss* (07.028) = 0) then the analogue input 1 current is used as normal.

Parameter	07.027 Analog Input 2 Preset on Current Loss		
Short description	Defines the current level held on analogue input 2 current loss		
Mode	RFC-A		
Minimum	4.00	Maximum	20.00
Default	4.00	Units	mA
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

If *Analogue Input 2 Mode* (07.011) is set to any of the *4-20mA Low* or *20-4mA Low* modes and the current falls below 3mA (*Analogue Input 2 Current Loop Loss* (07.029) = 1) then the analogue input 2 is held to *Analog Input 2 Preset on Current Loss* (07.027).

If the current rise above 4mA (*Analogue Input 2 Current Loop Loss* (07.029) = 0) then the analogue input 2 current is used as normal.

Parameter	07.028 Analogue Input 1 Current Loop Loss		
Short description	Displays when analog input 1 falls below 3mA		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Analog Input 1 Preset on Current Loss* (07.026).

Parameter	07.029 Analogue Input 2 Current Loop Loss		
Short description	Displays when analog input 2 falls below 3mA		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Analog Input 2 Preset on Current Loss* (07.027).

Parameter	07.030 Analogue Input 1 Offset		
Short description	Defines the offset of analog input 1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Analogue Input 1 Scaling* (07.008).

Parameter	07.031 Analogue Input 2 Offset		
Short description	Defines the offset of analog input 2		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Analogue Input 2 Scaling* (07.012).

Parameter	07.034 Inverter Temperature		
Short description	Displays the estimated junction temperature of the hottest power device within the drive inverter		
Mode	RFC-A		
Minimum	-250	Maximum	250
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Inverter Temperature (07.034) shows the estimated junction temperature of the hottest power device within the drive inverter. If this temperature exceeds the switch down threshold defined for the power stage the switching frequency is reduced provided this feature has not been disabled (i.e. *Auto-switching Frequency Change Disable* (05.035) = 0) or the minimum switching frequency has not been reached. The switching frequency can be reduced from 12kHz to 6kHz to 3kHz, or from 16kHz to 8kHz to 4kHz to 2kHz. If the switching frequency has been reduced the drive will attempt to restore it to the required level when the *Inverter Temperature* (07.034) reduces.

Parameter	07.035 Percentage Of d.c. Link Thermal Trip Level		
Short description	Displays the percentage of the maximum allowed temperature as estimated by the thermal model of the d.c. link components		
Mode	RFC-A		
Minimum	0	Maximum	100
Default		Units	%
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Percentage Of d.c. Link Thermal Trip Level (07.035) gives the percentage of the maximum allowed temperature as estimated by the thermal model of

the d.c. link components.

Parameter	07.036 Percentage Of Drive Thermal Trip Level		
Short description	Displays the percentage of the thermal trip level of the temperature monitoring point or thermal model in the drive that is highest		
Mode	RFC-A		
Minimum	0	Maximum	100
Default		Units	%
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Percentage Of Drive Thermal Trip Level (07.036) gives the percentage of the thermal trip level of the temperature monitoring point or thermal model in the drive that is highest. This includes all thermal monitoring points *Stack Temperature* (07.004), *Auxiliary Temperature* (07.005), *Inverter Temperature* (07.034) and *Percentage Of d.c. Link Thermal Trip Level* (07.035).

Percentage Of d.c. Link Thermal Trip Level (07.035) is used directly to give *Percentage Of Drive Thermal Trip Level* (07.036), but for all other monitored values which are temperatures this is given by

$$\text{Percentage of thermal trip level} = (\text{Temperature} - 40^{\circ}\text{C}) / (\text{Trip temperature} - 40^{\circ}\text{C}) \times 100\%$$

The location of the measurement or the thermal model that is related to this temperature is given in *Temperature Nearest To Trip Level* (07.037). If *Percentage Of Drive Thermal Trip Level* (07.036) exceeds 90% *Drive Over-temperature Alarm* (10.018) is set to one. If *Percentage Of Drive Thermal Trip Level* (07.036) reaches 100% one of the trips given in the table below is initiated. The trip can be reset when the percentage of thermal trip level fall below 95%.

Temperature	Trip
<i>Inverter Temperature</i> (07.034)	OHT Inverter
<i>Auxiliary Temperature</i> (07.005)	OHT Power
<i>Percentage Of d.c. Link Thermal Trip Level</i> (07.035)	OHT dc bus

Parameter	07.037 Temperature Nearest To Trip Level		
Short description	Displays the location or the model that corresponds to the value shown in Percentage Of Drive Thermal Trip Level		
Mode	RFC-A		
Minimum	0	Maximum	29999
Default		Units	
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Temperature Nearest To Trip Level (07.037) shows the location or the model that corresponds to the value shown in *Percentage Of Drive Thermal Trip Level* (07.036) in the form xxyzz as shown in the table below.

Source	xx	y	zz
Control system	00	1	00: Inverter thermal model
Control system	00	2	00: D.c. link thermal model
Power system	01	0	zz: Thermistor location defined by zz in the power system
Power system (Large frame only)	01	1	zz: Thermistor location defined by zz in the rectifier

Parameter	07.046 Thermistor Type		
Short description	Defines the thermistor type when used		
Mode	RFC-A		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	DIN44081
1	KTY84
2	PT1000
3	PT2000
4	Other

Thermistor Type (07.046) defines the operation of the temperature feedback interface for DI/O 05 when *Digital input 5 mode* (08.035) is 1, 2 or 3.

If *Thermistor Type* (07.046) = 0, the thermistor DIN44081 is designed to react like a temperature switch and therefore *Thermistor Temperature* (07.050) always reads 0.0°C.

If *Thermistor Type* (07.046) = 1 to 3 is selected, the digital input operation of the terminal is disabled.

If *Thermistor Type* (07.046) = 4, any thermistor can be used but *Thermistor Temperature* (07.050) always reads 0.0°C.

Parameter	07.047 Thermistor Feedback		
Short description	Displays the measured resistance of the thermistor when used		
Mode	RFC-A		
Minimum	0	Maximum	4000
Default		Units	Ω
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, FI, ND, NC, PT		

Thermistor Feedback (07.047) shows the measured resistance. If *Digital input 5 mode* (08.035) is 2 then {Th} trip is initiated if the feedback value is higher than *Thermistor Trip Threshold* (07.048). The trip cannot be reset unless the feedback is below *Thermistor Reset Threshold* (07.049). The default values for *Thermistor Trip Threshold* (07.048) and *Thermistor Reset Threshold* (07.049) are the levels specified in the DIN 44082 standard.

Parameter	07.048 Thermistor Trip Threshold		
Short description	Defines the thermistor trip threshold when used		
Mode	RFC-A		
Minimum	0	Maximum	4000
Default	3300	Units	Ω
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Thermistor Feedback* (07.047).

Parameter	07.049 Thermistor Reset Threshold		
Short description	Defines the thermistor reset threshold when used		
Mode	RFC-A		
Minimum	0	Maximum	4000
Default	1800	Units	Ω
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Thermistor Feedback* (07.047).

Parameter	07.050 Thermistor Temperature		
Short description	Displays the temperature of the device based on the resistance to temperature characteristic for the specified device		
Mode	RFC-A		
Minimum	-50	Maximum	300
Default		Units	°C
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, FI, ND, NC, PT		

If a KTY84, PT1000 or PT2000 type device is selected for temperature feedback (i.e. *Thermistor Type* (07.046) = 1 to 3) then *Thermistor Temperature* (07.050) shows the temperature of the device based on the resistance to temperature characteristic specified for this device. Otherwise *Thermistor Temperature* (07.050) = 0.0.

Parameter	07.051 Analogue Input 1 Control		
Short description	Defines the functionality of analog input 1		
Mode	RFC-A		
Minimum	0	Maximum	5
Default	0	Units	
Type	8 Bit User Save	Update Rate	Actioned on exit of edit mode and on drive reset
Display Format	Standard	Decimal Places	0
Coding	RW		

Value	Description	<i>Analogue Input 1 Destination B (07.090)</i>
0	User defined by <i>Analogue Input 1 Destination A (07.010)</i>	00.000
1	Frequency reference 1	01.036
2	Frequency reference 2	01.037
3	Maximum reference clamp	01.006
4	Current limit	04.007
5	Torque reference	04.008

This offers a simple control of parameter to change the analogue input 1 functionality.

If *Analogue Input 1 Control (07.051)* is more than 0 then the destination is defined by *Analogue Input 1 Destination B (07.090)*. The destination *Analogue Input 1 Destination B (07.090)* is written by *Analogue Input 1 Control (07.051)* selection. (i.e. If *Analogue Input 1 Control (07.051)* = 3 then *Analogue Input 1 Destination B (07.090)* = 01.006)

If *Analogue Input 1 Control (07.051)* is 0 then then the destination is defined by *Analogue Input 1 Destination A (07.010)*.

Parameter	07.052 Analogue Input 2 Control		
Short description	Defines the functionality of analog input 2		
Mode	RFC-A		
Minimum	0	Maximum	5
Default	0	Units	
Type	8 Bit User Save	Update Rate	Actioned on exit of edit mode and on drive reset
Display Format	Standard	Decimal Places	0
Coding	RW		

Value	Description	<i>Analogue Input 2 Destination B (07.094)</i>
0	User defined by <i>Analogue Input 2 Destination A (07.014)</i>	00.000
1	Frequency reference 1	01.036
2	Frequency reference 2	01.037
3	Maximum reference clamp	01.006
4	Current limit	04.007
5	Torque reference	04.008

This offers a simple control of parameter to change the analogue input 2 functionality.

If *Analogue Input 2 Control (07.052)* is more than 0 then the destination is defined by *Analogue Input 2 Destination B (07.094)*. The destination *Analogue Input 2 Destination B (07.094)* is written by *Analogue Input 2 Control (07.052)* selection. (i.e. If *Analogue Input 2 Control (07.052)*= 3 then *Analogue Input 2 Destination B (07.094)* = 01.006)

If *Analogue Input 2 Control (07.052)* is 0 then then the destination is defined by *Analogue Input 2 Destination A (07.014)*.

Parameter	07.055 Analogue Output 1 Control		
Short description	Defines the functionality of analog output 1		
Mode	RFC-A		
Minimum	0	Maximum	15
Default	0	Units	
Type	8 Bit User Save	Update Rate	Actioned on exit of edit mode and on drive reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Value	Description	Analogue Output 1 Source B (07.099)
0	User defined by <i>Analogue Output 1 Source A (07.019)</i>	00.000
1	Frequency output	02.001
2	Frequency reference	01.003
3	Motor speed	05.004
4	Current output vs drive	04.001
5	Current output vs motor	TBD: 0 ~ double motor rated current
6	Torque output	04.020
7	Torque current output	04.002
8	Voltage output	05.002
9	DC bus voltage (0~800V)	05.005
10	Analogue Input 1	07.001
11	Analogue Input 2	07.002
12	Power output (0~2*Pe)	05.003
13	Torque limitation	04.018
14	Torque reference (0~300%Tem)	04.008
15	External function of host (0~4095)	TBD (from comms)

This offers a simple control of parameter *Analogue Output 1 Source B (07.099)* to change the analogue output 1 source.

If *Analogue Output 1 Control (07.055)* is more than 0 then the source is defined by *Analogue Output 1 Source B (07.099)*. The source *Analogue Output 1 Source B (07.099)* is written by *Analogue Output 1 Control (07.055)* selection. (i.e. If *Analogue Output 1 Control (07.055)* = 13 then *Analogue Output 1 Source B (07.099)* = 04.018)

If 07.055 is 0 then then the source is defined by 07.019.

Parameter	07.056 Analogue Output 2 Control		
Short description	Defines the functionality of analog output 2		
Mode	RFC-A		
Minimum	0	Maximum	15
Default	0	Units	
Type	8 Bit User Save	Update Rate	Actioned on exit of edit mode and on drive reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Value	Description	Analogue Output 2 Source B (07.102)
0	User defined by <i>Analogue Output 2 Source A (07.022)</i>	00.000
1	Frequency output	02.001
2	Frequency reference	01.003
3	Motor speed	05.004
4	Current output vs drive	04.001
5	Current output vs motor	TBD: 0 ~ double motor rated current
6	Torque output	04.020
7	Torque current output	04.002
8	Voltage output	05.002
9	DC bus voltage (0~800V)	05.005
10	Analogue Input 1	07.001
11	Analogue Input 2	07.002
12	Power output (0~2*Pe)	05.003
13	Torque limitation	04.018
14	Torque reference (0~300%Tem)	04.008
15	External function of host (0~4095)	TBD (from comms)

This offers a simple control of parameter *Analogue Output 2 Source B (07.102)* to change the analogue output 2 source.

If *Analogue Output 2 Control (07.056)* is more than 0 then the source is defined by *Analogue Output 2 Source B (07.102)*. The source *Analogue Output 2 Source B (07.102)* is written by *Analogue Output 2 Control (07.056)* selection. (i.e. If *Analogue Output 2 Control (07.056)* = 13 then *Analogue Output 2 Source B (07.102)* = 04.018)

If *Analogue Output 2 Control (07.056)* is 0 then then the source is defined by *Analogue Output 2 Source A (07.022)*.

Parameter	07.061 Analogue Input 1 Minimum Reference		
Short description	Defines the minimum reference for analog input 1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

Analogue Input 1 (07.001) can be scaled and limited using the following parameters:

- Analogue Input 1 Minimum Reference (07.061)
- Analogue Input 1 At Minimum Reference (07.062)
- Analogue Input 1 Maximum Reference (07.063)
- Analogue Input 1 At Maximum Reference (07.064)

Parameters above can be selected to limit the range of Analogue Input 1 (07.001) and also scale it between the minimum and maximum reference.

If Analogue Input 1 Minimum Reference (07.061) \geq Analogue Input 1 Maximum Reference (07.063) then $A_{i1} = 0.00\%$ whatever the input level.

Input Level is limited between Analogue Input 1 At Minimum Reference (07.062) and Analogue Input 1 At Maximum Reference (07.064)

Analogue Input 1 (07.001) = $[(\text{Analogue Input 1 At Maximum Reference (07.064)} - \text{Analogue Input 1 At Minimum Reference (07.062)}) / (\text{Analogue Input 1 Maximum Reference (07.063)} - \text{Analogue Input 1 Minimum Reference (07.061)})] \times (\text{Input level} - \text{Analogue Input 1 Minimum Reference (07.061)}) + \text{Analogue Input 1 At Minimum Reference (07.062)}$.

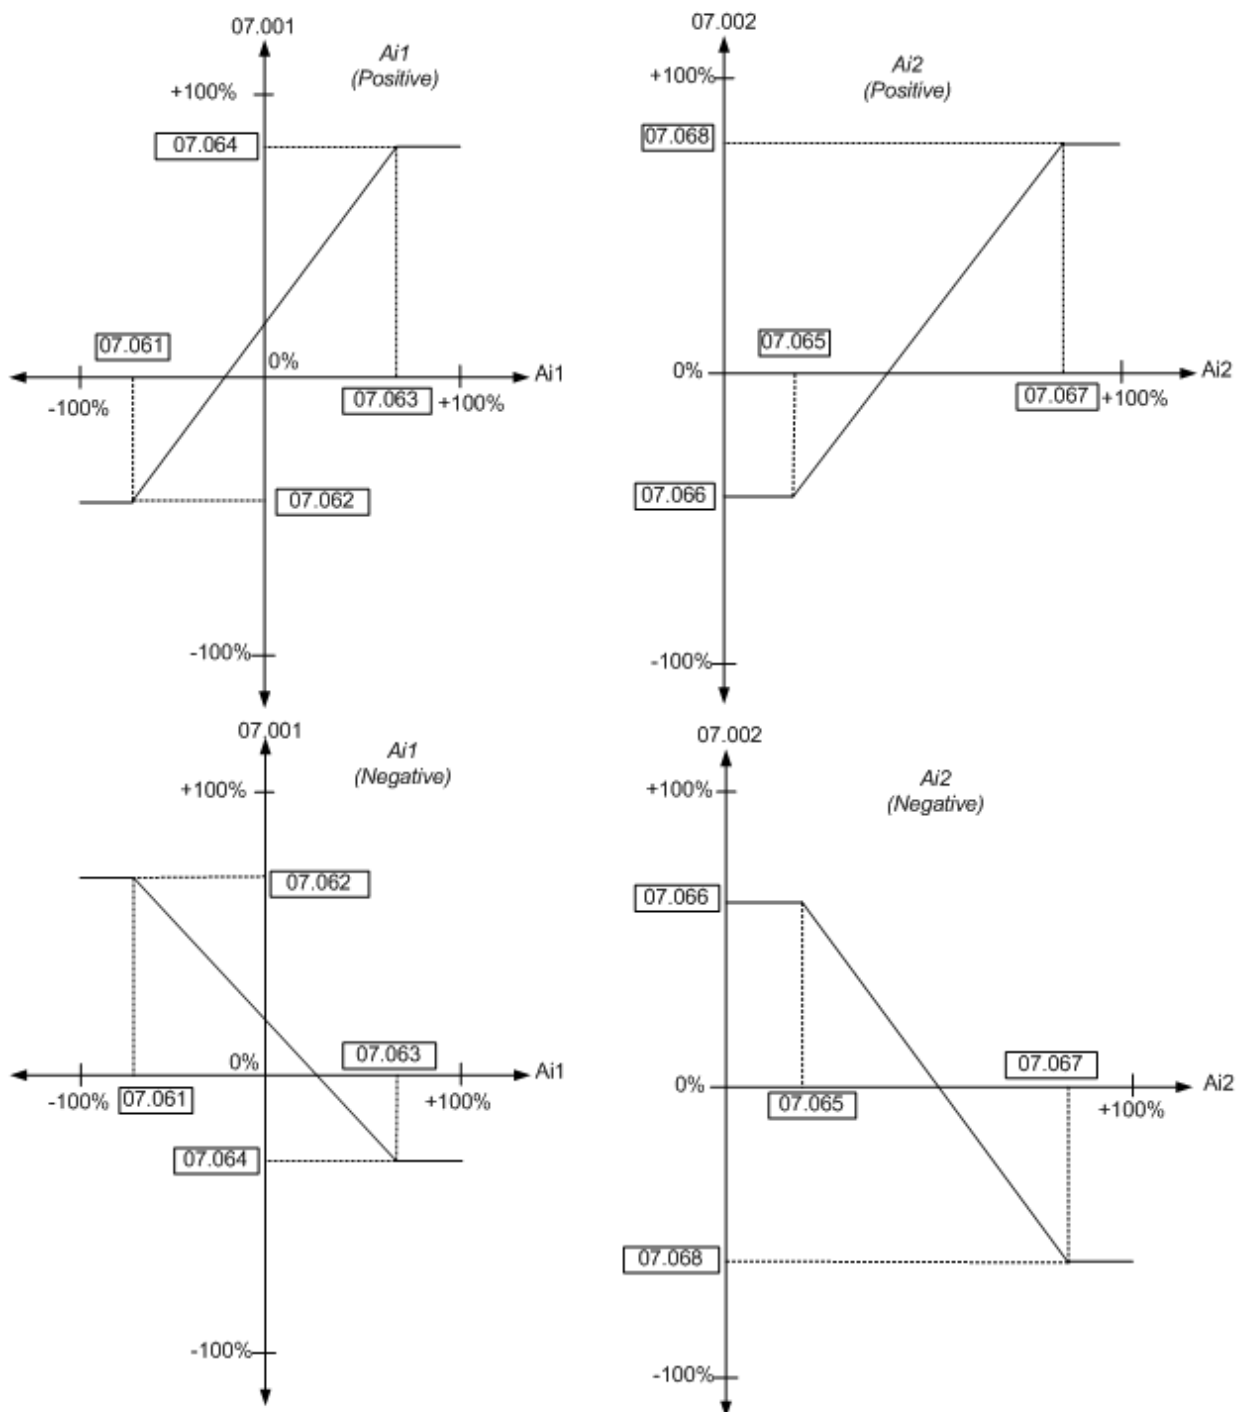

Fig.7.5c: Analogue Input scaling & limit

Parameter	07.062 Analogue Input 1 At Minimum Reference		
Short description	Defines the value of analog input 1 at minimum reference		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See Analogue Input 1 Minimum Reference (07.061).

Parameter	07.063 Analogue Input 1 Maximum Reference		
Short description	Defines the maximum reference for analog input 1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Analogue Input 1 Minimum Reference* (07.061).

Parameter	07.064 Analogue Input 1 At Maximum Reference		
Short description	Defines the value of analog input 1 at maximum reference		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Analogue Input 1 Minimum Reference* (07.061).

Parameter	07.065 Analogue Input 2 Minimum Reference		
Short description	Defines the minimum reference for analog input 2		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See graph in *Analogue Input 1 Minimum Reference* (07.061).

Analogue Input 2 (07.002) can be scaled and limited using the following parameters:

- *Analogue Input 2 Minimum Reference* (07.065)
- *Analogue Input 2 At Minimum Reference* (07.066)
- *Analogue Input 2 Maximum Reference* (07.067)
- *Analogue Input 2 At Maximum Reference* (07.068)

Parameters above can be selected to limit the range of *Analogue Input 2* (07.002) and also scale it between the minimum and maximum reference.

If *Analogue Input 2 Minimum Reference* (07.065) \geq *Analogue Input 2 Maximum Reference* (07.067) then $A_{i2} = 0.00\%$ whatever the input level.

Input Level is limited between *Analogue Input 2 At Minimum Reference* (07.066) and *Analogue Input 2 At Maximum Reference* (07.068)

$Analogue\ Input\ 2\ (07.002) = [(Analogue\ Input\ 2\ At\ Maximum\ Reference\ (07.068) - Analogue\ Input\ 2\ At\ Minimum\ Reference\ (07.066)) / (Analogue\ Input\ 2\ Maximum\ Reference\ (07.067) - Analogue\ Input\ 2\ Minimum\ Reference\ (07.065))] \times (Input\ level - Analogue\ Input\ 2\ Minimum\ Reference\ (07.065)) + Analogue\ Input\ 2\ At\ Minimum\ Reference\ (07.066).$

Parameter	07.066 Analogue Input 2 At Minimum Reference		
Short description	Defines the value of analog input 2 at minimum reference		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%

Menu 8 – Digital I/O

Mode: RFC-A

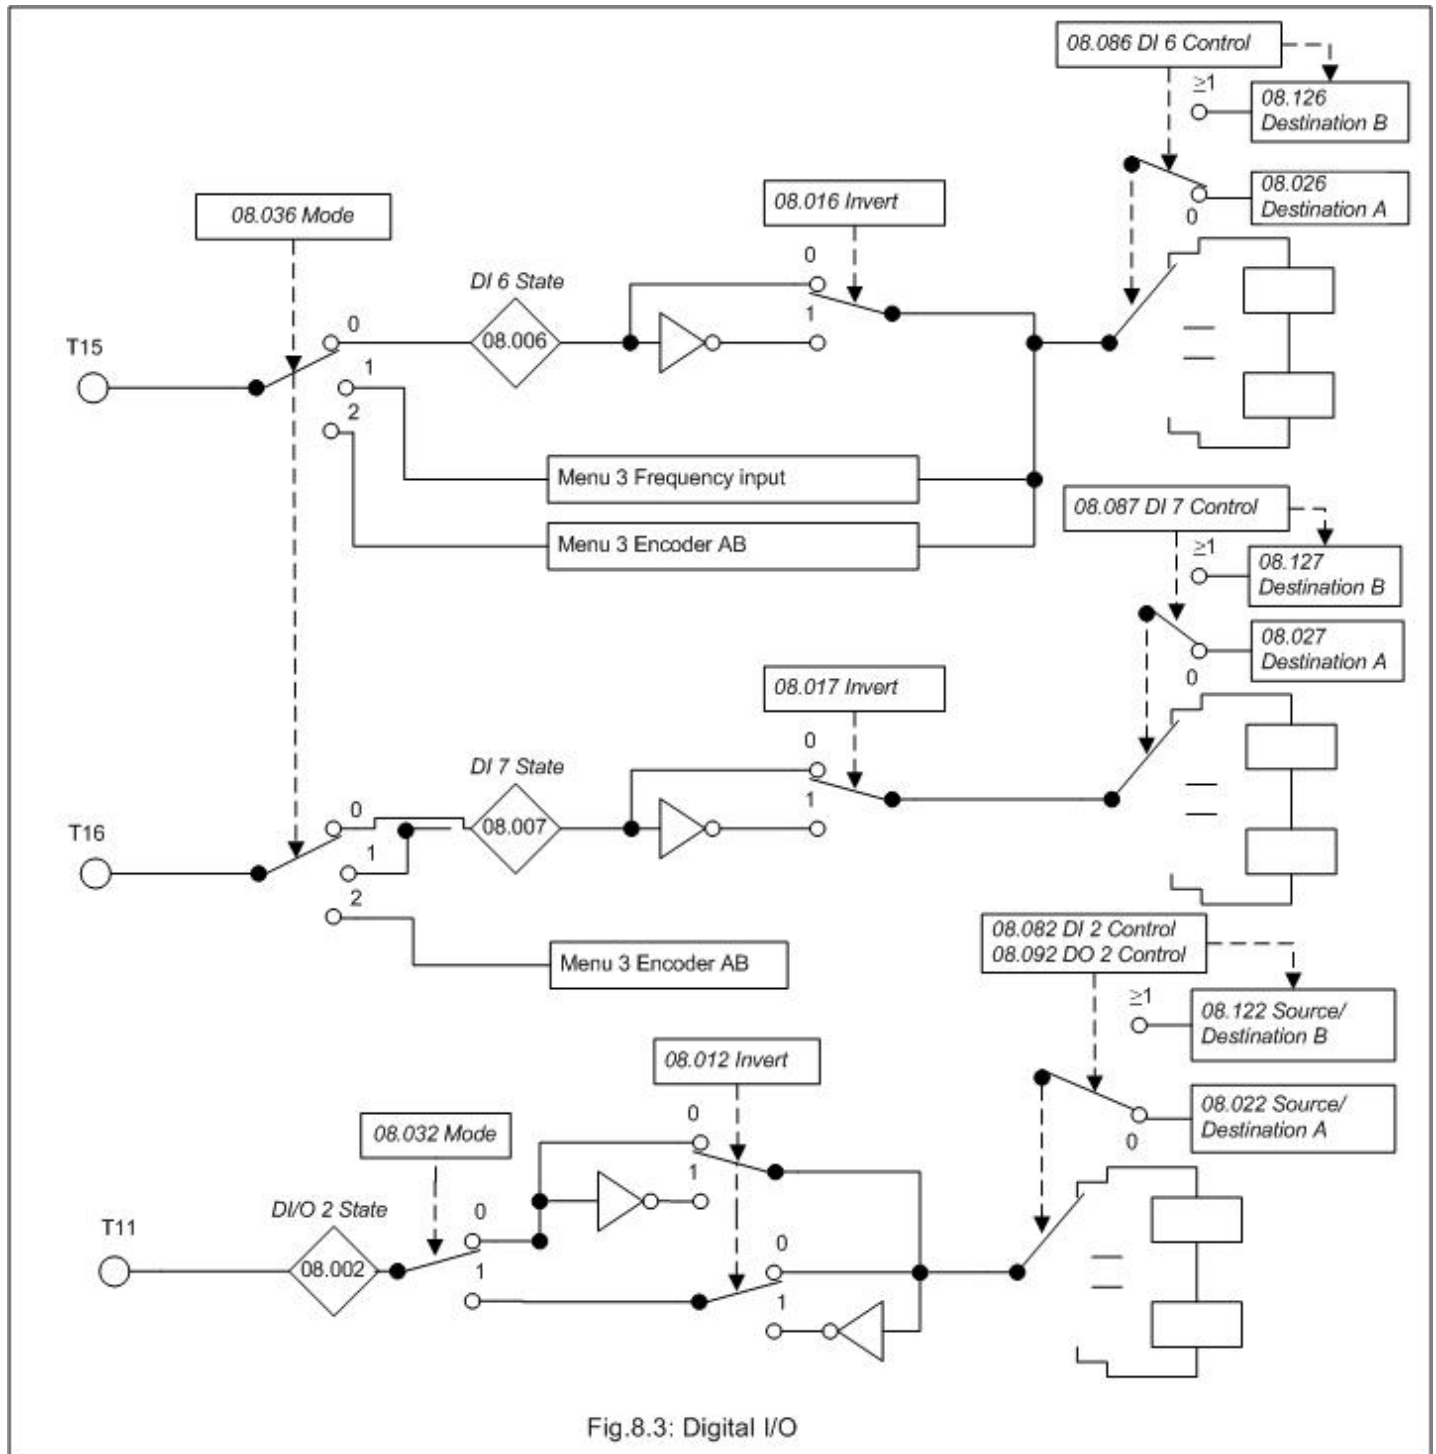

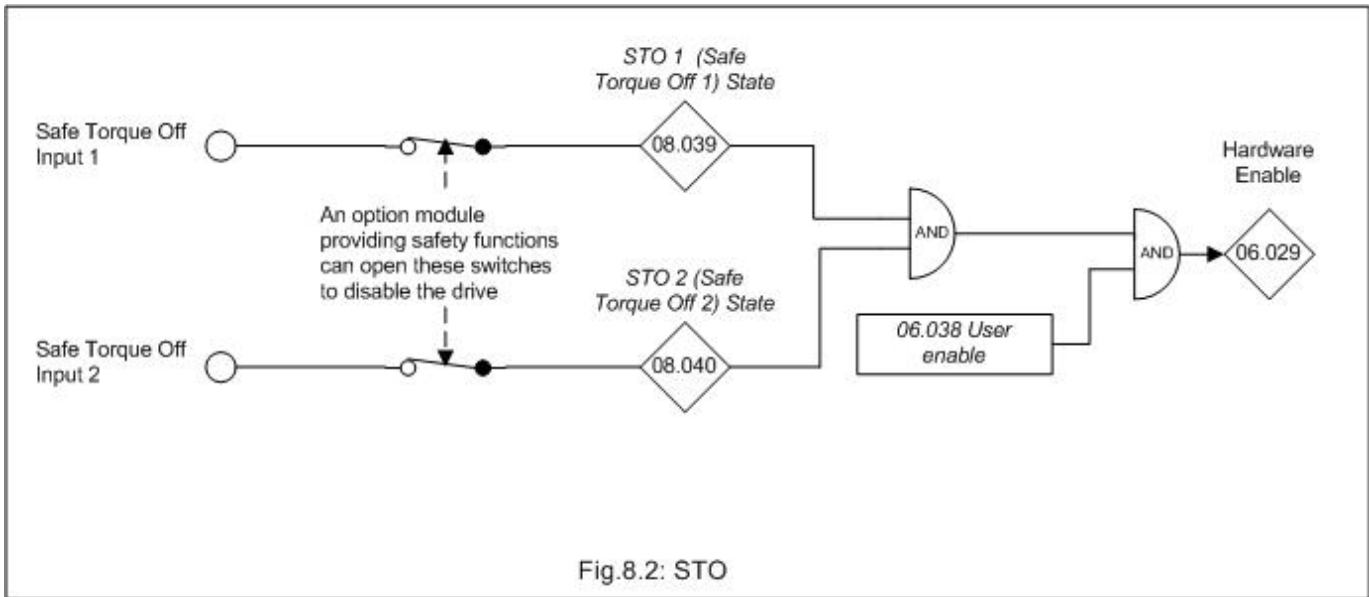

Fig.8.3: Digital I/O

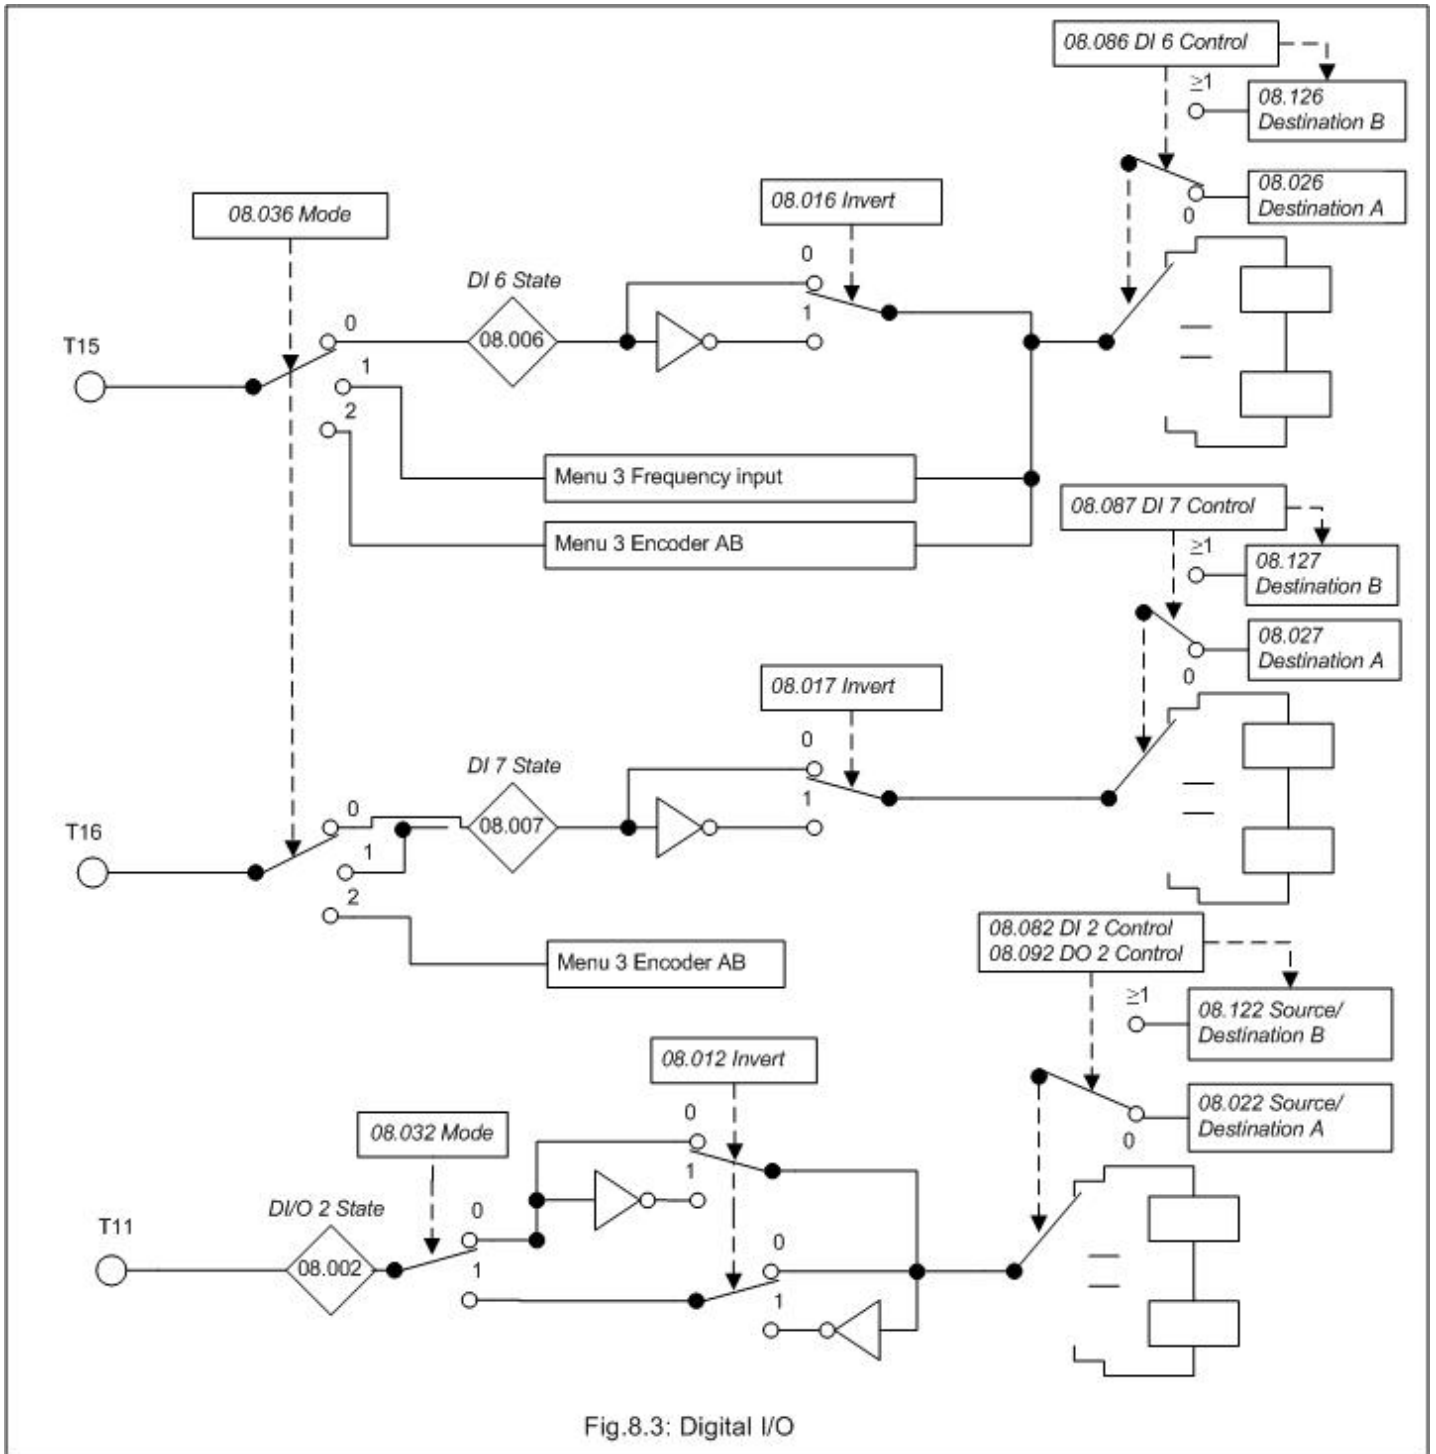

Fig. 8.3: Digital I/O

Parameter	08.001 Digital I/O 1 State		
Short description	Displays the state for digital input/output1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital I/O 1 State (08.001) represents the digital input/output 1 state whether it is a digital input or an output.

If Digital I/O 01 mode (08.031) = 0 then it is a digital input:

- Comply with IEC 61131-2. Positive or negative logic.
- Digital I/O 1 State (08.001) = 0 if the digital I/O is low (<9V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital I/O 1 State (08.001) = 1 if the digital I/O is high (>11V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital I/O 1 State (08.001) = 1 if the digital I/O is low (<9V) in negative logic Input Logic Polarity (08.010) = 0.
- Digital I/O 1 State (08.001) = 0 if the digital I/O is high (>11V) in negative logic Input Logic Polarity (08.010) = 0.

If Digital I/O 01 mode (08.031) = 1 then it is a digital output:

- 200mA total current including +24Vout; (50mA max per output).
- Positive logic only (with 6-7kΩ pull down).
- *Digital I/O 1 State* (08.001) = 0 if the source parameter value less than 50% of its range.
- *Digital I/O 1 State* (08.001) = 1 if the source parameter value more than 50% of its range.

If *Digital I/O 01 mode* (08.031) = 2 then it is a frequency output.

If *Digital I/O 01 mode* (08.031) = 3 then it is a PWM output.

Parameter	08.002 <i>Digital I/O 2 State</i>		
Short description	Displays the state for digital input/output 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital I/O 2 State (08.002) represents the digital input/output 2 state whether it is a digital input or an output.

If *Digital I/O 02 mode* (08.032) = 0 then it is a digital input:

- Comply with IEC 61131-2. Positive or negative logic.
- *Digital I/O 2 State* (08.002) = 0 if the digital I/O is low (<9V) in positive logic *Input Logic Polarity* (08.010) = 1.
- *Digital I/O 2 State* (08.002) = 1 if the digital I/O is high (>11V) in positive logic *Input Logic Polarity* (08.010) = 1.
- *Digital I/O 2 State* (08.002) = 1 if the digital I/O is low (<9V) in negative logic *Input Logic Polarity* (08.010) = 0.
- *Digital I/O 2 State* (08.002) = 0 if the digital I/O is high (>11V) in negative logic *Input Logic Polarity* (08.010) = 0.

If *Digital I/O 02 mode* (08.032) = 1 then it is a digital output:

- 200mA total current including +24Vout; (50mA max per output).
- Positive logic only (with 6-7kΩ pull down).
- *Digital I/O 2 State* (08.002) = 0 if the source parameter value less than 50% of its range.
- *Digital I/O 2 State* (08.002) = 1 if the source parameter value more than 50% of its range.

Parameter	08.003 <i>Digital Input 3 State</i>		
Short description	Displays the state for digital input 3		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital Input 3 State (08.003) represents the digital input 3 state.

- Comply with IEC 61131-2. Positive or negative logic.
- *Digital Input 3 State* (08.003) = 0 if the digital I/O is low (<9V) in positive logic *Input Logic Polarity* (08.010) = 1.
- *Digital Input 3 State* (08.003) = 1 if the digital I/O is high (>11V) in positive logic *Input Logic Polarity* (08.010) = 1.
- *Digital Input 3 State* (08.003) = 1 if the digital I/O is low (<9V) in negative logic *Input Logic Polarity* (08.010) = 0.
- *Digital Input 3 State* (08.003) = 0 if the digital I/O is high (>11V) in negative logic *Input Logic Polarity* (08.010) = 0.

Parameter	08.004 <i>Digital Input 4 State</i>		
Short description	Displays the state for digital input 4		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital Input 4 State (08.004) represents the digital input 4 state.

- Comply with IEC 61131-2. Positive or negative logic.
- *Digital Input 4 State* (08.004) = 0 if the digital I/O is low (<9V) in positive logic *Input Logic Polarity* (08.010) = 1.
- *Digital Input 4 State* (08.004) = 1 if the digital I/O is high (>11V) in positive logic *Input Logic Polarity* (08.010) = 1.
- *Digital Input 4 State* (08.004) = 1 if the digital I/O is low (<9V) in negative logic *Input Logic Polarity* (08.010) = 0.
- *Digital Input 4 State* (08.004) = 0 if the digital I/O is high (>11V) in negative logic *Input Logic Polarity* (08.010) = 0.

Parameter	08.005 Digital Input 5 State		
Short description	Displays the state for digital input 5		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital Input 5 State (08.005) represents the digital input 5 state.

- Comply with IEC 61131-2. Positive or negative logic.
- Digital Input 5 State (08.005) = 0 if the digital I/O is low (<9V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital Input 5 State (08.005) = 1 if the digital I/O is high (>11V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital Input 5 State (08.005) = 1 if the digital I/O is low (<9V) in negative logic Input Logic Polarity (08.010) = 0.
- Digital Input 5 State (08.005) = 0 if the digital I/O is high (>11V) in negative logic Input Logic Polarity (08.010) = 0.

Parameter	08.006 Digital Input 6 State		
Short description	Displays the state for digital input 6		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital Input 6 State (08.006) represents the digital input 6 state if Digital input 6/7 mode (08.036) = 0.

- Comply with IEC 61131-2. Positive or negative logic.
- Digital Input 6 State (08.006) = 0 if the digital I/O is low (<9V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital Input 6 State (08.006) = 1 if the digital I/O is high (>11V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital Input 6 State (08.006) = 1 if the digital I/O is low (<9V) in negative logic Input Logic Polarity (08.010) = 0.
- Digital Input 6 State (08.006) = 0 if the digital I/O is high (>11V) in negative logic Input Logic Polarity (08.010) = 0.

Parameter	08.007 Digital Input 7 State		
Short description	Displays the state for digital input 7		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital Input 7 State (08.007) represents the digital input 7 state if Digital input 6/7 mode (08.036) = 0 or 1.

- Comply with IEC 61131-2. Positive logic only.
- Digital Input 7 State (08.007) = 0 if the digital input is low (<9V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital Input 7 State (08.007) = 1 if the digital input is high (>11V) in positive logic Input Logic Polarity (08.010) = 1.
- Digital Input 7 State (08.007) = 1 if the digital I/O is low (<9V) in negative logic Input Logic Polarity (08.010) = 0.
- Digital Input 7 State (08.007) = 0 if the digital I/O is high (>11V) in negative logic Input Logic Polarity (08.010) = 0.

Parameter	08.008 Relay 1 Output State		
Short description	Displays the state for relay 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Relay 1 Output State (08.008) shows the state of Relay 1.

Parameter	08.010 Input Logic Polarity		
Short description	Set to 1 to invert the input logic polarity		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Negative Logic
1	Positive Logic

Change the polarity of all digital inputs.

See *Digital I/O 1 State* (08.001) to *Digital Input 7 State* (08.007).

Parameter	08.011 Digital I/O 1 Invert		
Short description	Set to 1 to invert digital input/output 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Digital I/O 1 Invert* (08.011) allows the I/O state to be non-inverted(0) or inverted(1) respectively.

If *Digital I/O 01 mode* (08.031) = 0 (Input) then *Digital I/O 1 Invert* (08.011) inverts the destination parameter *Digital IO1 Source/Destination A* (08.021) or *DI/O 01 Source/Destination B* (08.121).

If *Digital I/O 01 mode* (08.031) = 1 (Output) then *Digital I/O 1 Invert* (08.011) inverts *Digital I/O 1 State* (08.001) and the voltage on the output terminal.

If *Digital I/O 01 mode* (08.031) = 2 or 3 (Frequency or PWM output) then *Digital I/O 1 Invert* (08.011) has no effect.

Parameter	08.012 Digital I/O 2 Invert		
Short description	Set to 1 to invert digital input/output 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Digital I/O 2 Invert* (08.012) allows the I/O state to be non-inverted(0) or inverted(1) respectively.

If *Digital I/O 02 mode* (08.032) = 0 (Input) then *Digital I/O 2 Invert* (08.012) inverts the destination parameter *Digital IO2 Source/Destination A* (08.022) or *DI/O 02 Source/Destination B* (08.122).

If *Digital I/O 02 mode* (08.032) = 1 (Output) then *Digital I/O 2 Invert* (08.012) inverts *Digital I/O 2 State* (08.002) and the voltage on the output terminal.

Parameter	08.013 Digital Input 3 Invert		
Short description	Set to 1 to invert digital input 3		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Digital Input 3 Invert* (08.013) allows the input state to be non-inverted(0) or inverted(1) respectively.

Digital Input 3 Invert (08.013) inverts the destination parameter *Digital Input 03 Destination A* (08.023) or *DI 03 Destination B* (08.123).

Parameter	08.014 Digital Input 4 Invert		
Short description	Set to 1 to invert digital input 4		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Digital Input 4 Invert* (08.014) allows the input state to be non-inverted(0) or inverted(1) respectively.

Digital Input 4 Invert (08.014) inverts the destination parameter *Digital Input 04 Destination A* (08.024) or *DI 04 Destination B* (08.124).

Parameter	08.015 Digital Input 5 Invert		
Short description	Set to 1 to invert digital input 5		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Digital Input 5 Invert* (08.015) allows the input state to be non-inverted(0) or inverted(1) respectively.

If *Digital input 5 mode* (08.035) = 0 then *Digital Input 5 Invert* (08.015) inverts the destination parameter *Digital Input 05 Destination A* (08.025) or *DI 05 Destination B* (08.125).

If *Digital input 5 mode* (08.035) > 0 then *Digital Input 5 Invert* (08.015) has no effect.

Parameter	08.016 Digital Input 6 Invert		
Short description	Set to 1 to invert digital input 6		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Digital Input 6 Invert* (08.016) allows the input state to be non-inverted(0) or inverted(1) respectively.

If *Digital input 6/7 mode* (08.036) = 0 then *Digital Input 6 Invert* (08.016) inverts the destination parameter *Digital Input 06 Destination A* (08.026) or *DI 06 Destination B* (08.126).

If *Digital input 6/7 mode* (08.036) > 0 then *Digital Input 6 Invert* (08.016) has no effect.

Parameter	08.017 Digital Input 7 Invert		
Short description	Set to 1 to invert digital input 7		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Digital Input 7 Invert* (08.017) allows the input state to be non-inverted(0) or inverted(1) respectively.

If *Digital input 6/7 mode* (08.036) = 0 then *Digital Input 7 Invert* (08.017) inverts the destination parameter *Digital Input 07 Destination A* (08.027) or *DI 07 Destination B* (08.127).

If *Digital input 6/7 mode* (08.036) > 0 then *Digital Input 7 Invert* (08.017) has no effect.

Parameter	08.018 Relay 1 Invert		
Short description	Set to 1 to invert relay 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

A value of 0 or 1 in *Relay 1 Invert* (08.018) allows the input state to be non-inverted(0) or inverted(1) respectively.

Parameter	08.020 Digital I/O Read Word		
Short description	Displays the states for the digital I/O		
Mode	RFC-A		
Minimum	0 (Display: 000000000000)	Maximum	2048 (Display: 100000000000)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital I/O Read Word (08.020) reflects the state of DI/O 01 to DI 07, both STO and the relay as given below. Each bit matches the value of the state parameter for the respective digital input or output so the bit value for digital inputs will be the state of the actual input before any inversion or toggle selections are applied. The bit value for digital outputs will include the state inversion if selected in the invert/toggle parameter for the output.

Name	Digital I/O Read Word (08.020) bit
DI/O 01	0
DI/O 02	1
DI 03	2
DI 04	3
DI 05	4
DI 06	5
DI 07	6
STO 01	7
STO 02	8
RLY 01	9
Reserved	10

Parameter	08.021 Digital IO1 Source/Destination A		
Short description	Defines the source or destination parameter for digital I/O 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	10.003	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

Digital IO1 Source/Destination A (08.021) provides the destination parameter if DI/O 1 is an input and *DI1 Control* (08.081) = 0.

Digital IO1 Source/Destination A (08.021) provides the source parameter if DI/O 1 is an output and *DO1 Control* (08.091) = 0.

Parameter	08.022 Digital IO2 Source/Destination A		
Short description	Defines the source or destination parameter for digital I/O 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

Digital IO2 Source/Destination A (08.022) provides the destination parameter if DI/O 2 is an input and *DI2 Control* (08.082) = 0.

Digital IO2 Source/Destination A (08.022) provides the source parameter if DI/O 2 is an output and DO2 Control (08.092) = 0.

Parameter	08.023 Digital Input 03 Destination A		
Short description	Defines the destination parameter for digital Input 3		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	6.030	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

Digital Input 03 Destination A (08.023) provides the destination parameter if DI3 Control (08.083) = 0.

Parameter	08.024 Digital Input 04 Destination A		
Short description	Defines the destination parameter for digital input 4		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	6.032	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

Digital Input 04 Destination A (08.024) provides the destination parameter if DI4 Control (08.084) = 0.

Parameter	08.025 Digital Input 05 Destination A		
Short description	Defines the destination parameter for digital input 5		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.041	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

Digital Input 05 Destination A (08.025) provides the destination parameter if DI5 Control (08.085) = 0.

Parameter	08.026 Digital Input 06 Destination A		
Short description	Defines the destination parameter for digital input 6		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	6.031	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

Digital Input 06 Destination A (08.026) provides the destination parameter if DI6 Control (08.086) = 0.

Parameter	08.027 Digital Input 07 Destination A		
Short description	Defines the destination parameter for digital input 7		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

Digital Input 07 Destination A (08.027) provides the destination parameter if DI7 Control (08.087) = 0.

Parameter	08.028 Relay 1 Output Source A		
Short description	Defines the source parameter for relay 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	10.001	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, PT		

Relay 1 Output Source A (08.028) provides the source parameter if Relay 1 Control (08.098) = 0.

Parameter	08.031 Digital I/O 01 mode		
Short description	Defines the mode for the functionality of digital input/output 1		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Input	Digital input
1	Output	Digital output
2	Frequency output	Frequency output
3	PWM output	PWM output

This parameter selects the function of input/output DI/O 1.

See also *Digital I/O 1 State* (08.001).

Parameter	08.032 Digital I/O 02 mode		
Short description	Defines the mode for the functionality of digital input/output 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Input	Digital Input
1	Output	Digital Output

This parameter selects the function of input/output DI/O 2.

See also *Digital I/O 2 State* (08.002).

Parameter	08.035 Digital input 5 mode		
Short description	Defines the function for digital input 5		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	Digital Input	Input
1	Therm Short Cct	Temperature measurement input with short circuit detection (Resistance <50Ohm)
2	Thermistor	Temperature measurement input without short circuit detection but with Th trip
3	Therm No Trip	Temperature measurement input with no trips

This parameter selects the function of input DI 05.

See also *Digital Input 5 State* (08.005).

The motor thermistor should be connected between terminal 14 and terminal 6 (0 V)

Parameter	08.036 Digital input 6/7 mode		
Short description	Defines the function for digital inputs 6 and 7		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Digital Input
1	Frequency
2	Encoder AB

This parameter selects the function of input DI 6 and 7.

If *Digital input 6/7 mode* (08.036) = 0, DI 06 and DI 07 are both digital inputs.

If *Digital input 6/7 mode* (08.036) = 1, DI 06 is selected as frequency input. See menu *Frequency Monitoring and Speed Feedback* for more details. DI 07 is selected as digital input.

If *Digital input 6/7 mode* (08.036) = 2, both input DI 06 and DI 07 are encoder inputs. DI 06 is channel A and DI 07 is channel B. See menu *Frequency Monitoring and Speed Feedback* for more details.

Parameter	08.039 STO Input 01 State		
Short description	Displays the state of safe torque off channel 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

STO 01 and STO 02 correspond to two safe torque off channels within the drive.

Both channels must be in the high state for the drive to be enabled. The state parameters are 0 (OFF), if the digital input is low or 1 (ON) if the digital input is high

Parameter	08.040 STO Input 02 State		
Short description	Displays the state of safe torque off channel 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	1ms
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *STO Input 01 State* (08.039).

Parameter	08.041 Keypad Run Button State		
Short description	Displays the state for the Keypad Run Forward button		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Digital Input 11 (Keypad Run Button), Digital Input 12 (Keypad Auxiliary Button) and Digital Input 14 (Keypad Stop Button) represent the state of the Run, Auxiliary and Stop buttons on any keypad fitted to the drive; the input state is determined by ORing the state of the button on each keypad connected to the drive, if the button is pressed the state parameter is one otherwise it is zero. If a keypad is not fitted the state parameters are zero.

Digital Input 13 (24V Supply Input) is an external 24V supply input that is monitored and can be used as a 24V digital input if an external 24V supply is not required. The state parameter is low for the voltage range from 0V to 17V and high for the voltage range above 18V. As the input is a power supply it will consume significant current if the level is taken above 24V when the drive is running from its internal power supply, or at any voltage level if this input is the only power supply to the drive. The 24V Input is available on the AI SD card adaptor. The 24V alarm is triggered if *24V Alarm Loss Enable* (11.098) = 1 and *24V Supply Input State* (08.043) = 0.

Parameter	08.042 Keypad Auxiliary Button State		
Short description	Displays the state for the Keypad Auxiliary button		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Keypad Run Button State* (08.041).

Parameter	08.043 24V Supply Input State		
Short description	Displays the state for the 24V Supply Input		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Keypad Run Button State* (08.041).

Parameter	08.044 Keypad Stop Button State		
Short description	Displays the state for the Keypad Stop button		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Keypad Run Button State* (08.041).

Parameter	08.051 Keypad Run Button Invert/Toggle		
Short description	Set to invert/toggle Keypad Run Button		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert
2	Toggle

A value of 0 or 1 allows the input state to be non-inverted or inverted respectively.

An additional toggle function is provided for Keypad Run and Auxiliary button inputs. The toggle function output changes state on each rising edge (0 to 1 change) at its input.

Parameter	08.052 Keypad Auxiliary Button Invert/Toggle		
Short description	Set to invert/toggle Keypad Auxiliary Button		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert
2	Toggle

See *Keypad Run Button Invert/Toggle* (08.051).

Parameter	08.053 24V Supply Input Invert		
Short description	Set to invert 24V Supply Input		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Not Invert
1	Invert

See *Keypad Run Button Invert/Toggle* (08.051).

Parameter	08.061 Keypad Run Button Destination		
Short description	Defines the destination parameter for digital input 11		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

These destination parameters provide the routing for the Run (DI 11), Auxiliary (DI 12) and 24V Input(DI 13) inputs.

The Auxiliary button is available on the remote KI-Keypad. The 24V Input is available on the AI SD card adaptor.

Parameter	08.062 Keypad Auxiliary Button Destination		
Short description	Defines the destination parameter for digital input 12		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT		

See *Keypad Run Button Destination* (08.061).

Parameter	08.063 24V Supply Input Destination		
Short description	Defines the destination parameter for DI 13		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Keypad Run Button Destination* (08.061).

Parameter	08.081 DI1 Control		
Short description	Defines the behaviour of digital input 1		
Mode	RFC-A		
Minimum	0	Maximum	26
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

Value	Description	DI/O xx Source/Destination B	Other setup
0	User defined by <i>Digital IO1 Source/Destination A</i> (08.021) to <i>Digital Input 07 Destination A</i> (08.027)	00.000	
1	Multi preset ref selection 1	01.045	
2	Multi preset ref selection 2	01.046	
3	Multi preset ref selection 3	01.047	
4	External stop command	06.039	
5	Acc time selection 1	02.032	
6	Acc time selection 2	02.033	
7	Acc time selection 3	02.034	
8	Speed control and torque control switcher	04.011	
9	External fault N.C. contact input	10.032	
10	External reset	10.033	
11	External jog fwd	06.031	
12	External jog rev	06.037	
13	Drive enable	06.015	
14	Ramp hold	02.003	
15	RUN FWD	06.030	
16	RUN REV	06.032	
17	3-line run control (Latching)	06.040	
18	Forward limit switch	06.035	
19	Reverse limit switch	06.036	
20	Main ref channel selection 3	01.043	
21	Main ref channel selection 2	01.042	
22	Main ref channel selection 3	01.041	
23	PID1 Enable	14.008	
24	Motor 1/2 switcher	11.045	
25	Motorised pot UP	09.026	
26	Motorised pot DOWN	09.027	

This offers a simple control of *DI/O 01 Source/Destination B* (08.121) to *DI 07 Destination B* (08.127), to change the digital input destination. If *Dlx Control* (08.08x) is more than 0 then the destination is defined by *DI/O 0x Source/Destination* (08.12x). *DI/O 0x Source/Destination* (08.12x) is written by *Dlx Control* (08.08x) selection. (e.g. If *DI1 Control* (08.081) = 13 then *DI/O 01 Source/Destination B* (08.121) = 06.015)

If *Dlx Control* (08.08x) is 0 then the destination is defined by *DI/O 0x Source/Destination* (08.02x).

Parameter	08.082 DI2 Control		
Short description	Defines the behaviour of digital input 2		
Mode	RFC-A		
Minimum	0	Maximum	26
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

See *DI1 Control* (08.081).

Parameter	08.083 DI3 Control		
Short description	Defines the behaviour of digital input 3		
Mode	RFC-A		
Minimum	0	Maximum	26
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

See *DI1 Control* (08.081).

Parameter	08.084 DI4 Control		
Short description	Defines the behaviour of digital input 4		
Mode	RFC-A		
Minimum	0	Maximum	26
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

See *DI1 Control* (08.081).

Parameter	08.085 DI5 Control		
Short description	Defines the behaviour of digital input 5		
Mode	RFC-A		
Minimum	0	Maximum	26
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

See *DI1 Control* (08.081).

Parameter	08.086 DI6 Control		
Short description	Defines the behaviour of digital input 6		
Mode	RFC-A		
Minimum	0	Maximum	26
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

Only available on M400.

See *DI1 Control* (08.081).

Parameter	08.087 DI7 Control		
Short description	Defines the behaviour of digital input 7		
Mode	RFC-A		
Minimum	0	Maximum	26
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

Only available on M400.

See *DI1 Control* (08.081).

Parameter	08.091 DO1 Control		
Short description	Defines the behaviour of digital output 1		
Mode	RFC-A		
Minimum	0	Maximum	21
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

Value	Description	DI/O 01 Source/Destination B (08.121), DI/O 02 Source/Destination B (08.122) or Relay 01 Source B (08.128)
0	User defined by Digital IO1 Source/Destination A (08.021), Digital IO2 Source/Destination A (08.022) or Relay 1 Output Source A (08.028)	00.000
1	Drive running signal (RUN)	10.002
2	Frequency arrived signal (FAR)	10.006 (at frequency)
3	Reserved	Reserved
4	Reserved	Reserved
5	Overload detection signal (OL)	10.017
6	Power off state (LU)	10.016
7	External fault stop (EXT)	10.032
8	Frequency upper limit (FHL)	10.007
9	Frequency lower limit (FLL)	10.004
10	Drive running at zero frequency	10.003
11	Reserved	Reserved
12	Reserved	Reserved
13	Reserved	Reserved
14	Drive (RDY)	10.090
15	Drive healthy	10.001
16	Reserved	Reserved
17	Reserved	Reserved
18	Brake release	12.040
19	Torque limiting (Valid while the torque is limited by torque limiting value 1/2)	10.009
20	Forward or reverse	10.014
21	Motor 1 or 2	11.045

This offers a simple control of parameter *DI/O 01 Source/Destination B* (08.121), *DI/O 02 Source/Destination B* (08.122) or *Relay 01 Source B* (08.128) to change the source.

If the control parameter (08.09x) is more than 0 then the source is defined by the relevant source parameter B (08.12x). The source parameter is written by the control selection. (e.g. If *DO1 Control* (08.091) = 10 then *DI/O 01 Source/Destination B* (08.121) = 10.003)

If the control parameter is 0 then the source is defined by the relevant source parameter A (08.02x).

Parameter	08.092 DO2 Control		
Short description	Defines the behaviour of digital output 2		
Mode	RFC-A		
Minimum	0	Maximum	21
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

See *DO1 Control* (08.091).

Parameter	08.098 Relay 1 Control		
Short description	Defines the behaviour of relay 1		
Mode	RFC-A		
Minimum	0	Maximum	21
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW		

See *DO1 Control* (08.091).

Parameter	08.121 DI/O 01 Source/Destination B		
Short description	Defines the secondary source or destination parameter for digital input/output 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RO, DE, PT		

Refer to control parameters (*DI1 Control* (08.081) and *DO1 Control* (08.091)) for more information.

Parameter	08.122 DI/O 02 Source/Destination B		
Short description	Defines the secondary source or destination parameter for digital input/output 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RO, DE, PT		

See DI/O 01 Source/Destination B (08.121).

Parameter	08.123 DI 03 Destination B		
Short description	Defines the secondary destination parameter for digital input 3		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RO, DE, PT		

See DI/O 01 Source/Destination B (08.121).

Parameter	08.124 DI 04 Destination B		
Short description	Defines the secondary destination parameter for digital input 4		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RO, DE, PT		

See DI/O 01 Source/Destination B (08.121).

Parameter	08.125 DI 05 Destination B		
Short description	Defines the secondary destination parameter for digital input 5		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RO, DE, PT		

See DI/O 01 Source/Destination B (08.121).

Parameter	08.126 DI 06 Destination B		
Short description	Defines the secondary destination parameter for digital input 6		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RO, DE, PT		

See DI/O 01 Source/Destination B (08.121).

Parameter	08.127 DI 07 Destination B		
Short description	Defines the secondary destination parameter for digital input 7		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RO, DE, PT		

See DI/O 01 Source/Destination B (08.121).

Parameter	08.128 Relay 01 Source B		
Short description	Defines the secondary source parameter for relay 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive Reset Read
Display Format	Standard	Decimal Places	3
Coding	RW, PT		

See DO1 Control (08.091).

Menu 9 – *User Functions 1*

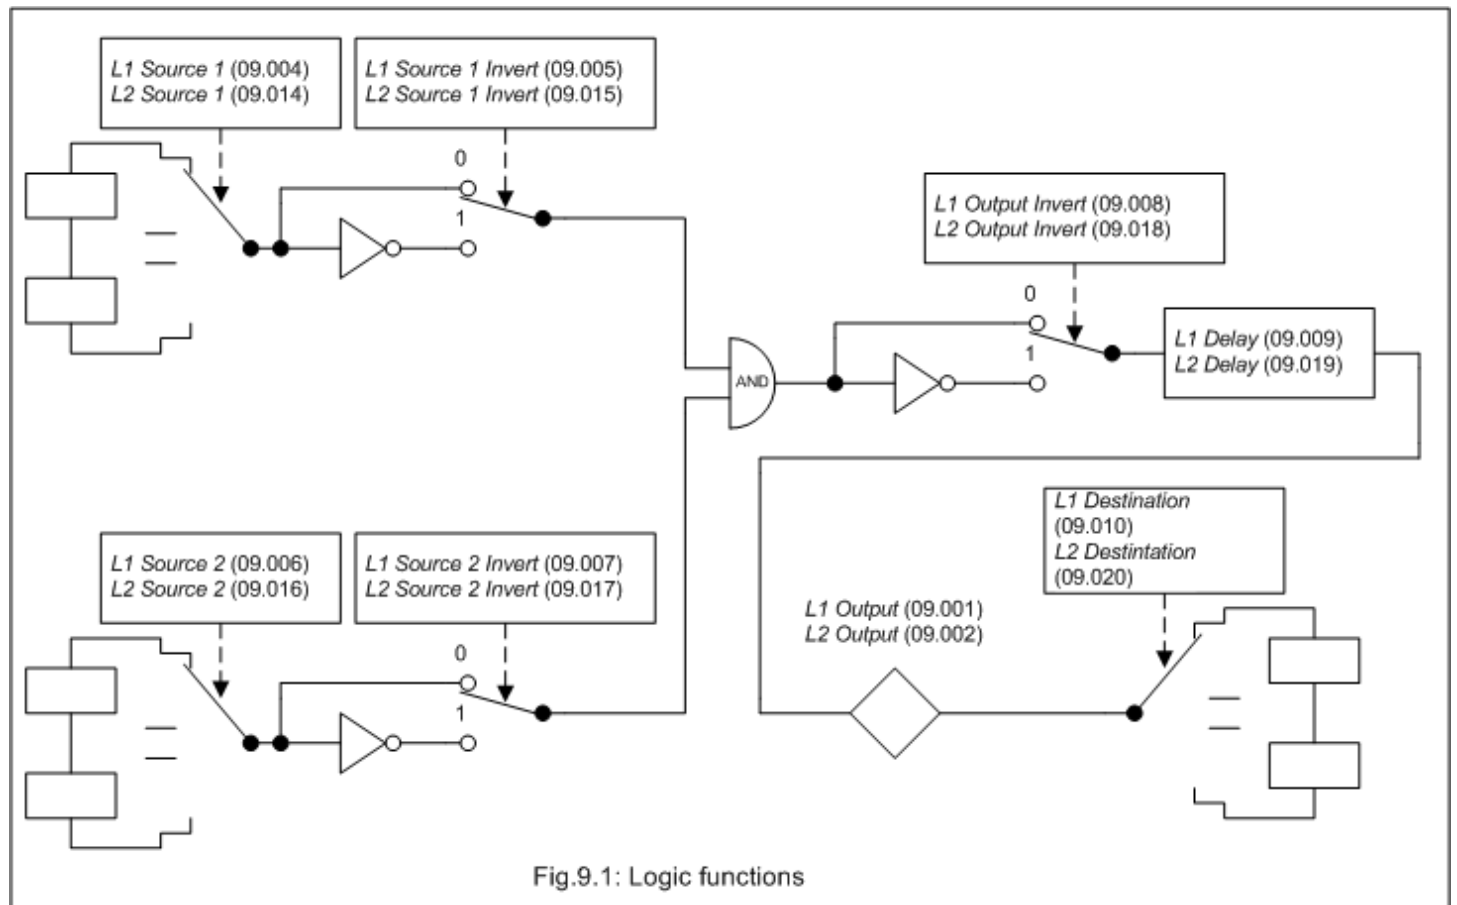

Mode: RFC-A

Menu 9 provides the parameters for the following features:

1. Logic functions
2. Motorised Pot
3. Binary Sum
4. Timers

Logic functions

The logic functions are always active even if the sources and destinations are not routed to valid parameters. If the sources are not valid parameters then the source values are taken as 0. The update rate for each of the logic functions is always 4ms

The logic function consists of an AND gate with inverters on each input and an inverter on the output. Some of the other standard logic functions can be produced as shown in the table below.

Logic function	Source 1 Invert	Source 2 Invert	Output Invert
AND	0	0	0
NAND	0	0	1
OR	1	1	1
NOR	1	1	0

A delay function is provided at the output of the logic functions. If *Logic Function 1 Delay* (09.009) or *Logic Function 2 Delay* (09.019) is positive then the output does not become 1 until the input to the delay has been at 1 for the delay time. If *Logic Function 1 Delay* (09.009) or *Logic Function 2 Delay* (09.019) is negative then the output remains at 1 until the input to the delay has been 0 for the delay time.

Motorised pot

Fig.9.3: Motorised pot

If *Motorised Pot Reset* (09.028) = 1 then the motorised pot is disabled and held in its reset state with *Motorised Pot Output* (09.003) = 0.0%. If *Motorised Pot Reset* (09.028) = 0 the motorised pot is enabled even if *Motorised Pot Destination* (09.025) is not routed to a valid parameter. The sample rate of the motorised pot is always 4ms.

When the motorised pot is active *Motorised Pot Output* (09.003) can be increased or decreased by setting *Motorised Pot Up* (09.026) or *Motorised Pot Down* (09.027) to 1 respectively. If both *Motorised Pot Up* (09.026) and *Motorised Pot Down* (09.027) are 1 then *Motorised Pot Output* (09.003) is increased. The rate of change of *Motorised Pot Output* (09.003) is defined by *Motorised Pot Rate* (09.023) which gives the time to change from 0 to 100%. The time to change from -100% to 100% is *Motorised Pot Rate* (09.023) x 2. If *Motorised Pot Bipolar Select* (09.022) = 0 then *Motorised Pot Output* (09.003) is limited in the range 0.00% to 100.00%, otherwise it is allowed to change in the range from -100.00% to 100.00%.

Motorised Pot Mode (09.021) defines the mode of operation as given in the table below.

<i>Motorised Pot Mode</i> (09.021)	<i>Motorised Pot Output</i> (09.003)	<i>Motorised Pot Up</i> (09.026) and <i>Motorised Pot Down</i> (09.027) active
0	Reset to zero at power-up	Always
1	Set to power-down value at power-up	Always
2	Reset to zero at power-up	When <i>Drive Active</i> (10.002) = 1
3	Set to power-down value at power-up	When <i>Drive Active</i> (10.002) = 1
4	Reset to zero at power-up and when <i>Drive Active</i> (10.002) = 0	When <i>Drive Active</i> (10.002) = 1

Motorised Pot Scaling (09.024) introduces a scaling factor at the output of the motorised pot before the output is routed to the destination. If *Motorised Pot Scaling* (09.024) $>$ 1.000 the output will exceed the range of the destination parameter, and so the destination parameter will be at its maximum or minimum before the output of the motorised pot reaches the limits of its range.

Binary sum

The binary sum function is always active even if the destination is not routed to valid a parameter. The update rate for the binary sum is always 4ms.

The output of the binary sum block is given by

$$\text{Binary Sum Output (09.032)} = \text{Binary Sum Offset (09.034)} + (\text{Binary Sum Ones (09.029)} \times 1) + (\text{Binary Sum Twos (09.030)} \times 2) + (\text{Binary Sum Fours (09.031)} \times 4)$$

Binary Sum Destination (09.033) defines the destination for the binary sum output. The routing for this destination is special if the maximum of the destination parameter $\leq 7 + [\text{Binary Sum Offset (09.034)}]$ as follows:

Destination parameter = *Binary Sum Output (09.032)*, subject to the parameter minimum

Otherwise *Binary Sum Output (09.032)* is routed in the same way as any other destination where the destination target is at its full scale value when the *Binary Sum Output (09.032)* = 7 + Offset.

Timers

If the enable input to a timer is active and the repeat function is set to a non-zero value then the timer is active even if the destination is not routed to valid a parameter. The timers are updated in the background task and have a resolution of 1s.

Fig.9.5: Timers

The following is a description of Timer 1, but Timer 2 behaves in the same way. If *Timer 1 Invert* = 0 then *Timer 1 Output* (09.042) is inactive before the *Timer 1 Start Date* (09.035) / *Timer 1 Start Time* (09.036), active between this date/time and *Timer 1 Stop Date* (09.037) / *Timer 1 Stop Time* (09.038) and then inactive after the stop time/date within the timer 1 repeat period as shown in the diagram below.

Fig.9.6: Timer 1 output

Timer 1 Repeat Function (09.039) defines the length of the repeat period. For example if *Timer 1 Repeat Function* (09.039) = 2 then the repeat period is one day. The output is inactive until the time reaches the hour, minute and second defined in *Timer 1 Start Time* (09.036), and remains active until the time reaches the hour, minute and second defined in *Timer 1 Stop Time* (09.038). Different repeat periods may be selected as given in the table below. The table shows the constituent parts of the date and time that are used to determine the start and stop events. If the repeat period is set to every week then *Timer 1 Start Date* (09.035) and *Timer 1 Stop Date* (09.037) define the day of the week and not the date (i.e. 00.00.00 = Sunday, 00.00.01 = Monday, etc.). If the stop time event is set to occur at or before the start time event or the *Timer 1 Repeat Function* (09.039) = 0 or *Timer 1 Enable* (09.040) = 0 the output remains inactive at all times (i.e. *Timer 1 Output* (09.042) = 0 if *Timer 1 Invert* = 0).

Timer 1 Repeat Function (09.039)	Repeat period	Second	Minute	Hour	Day	Month	Year	Day of week
0	None							
1	Hour	.	.					
2	Day	.	.	.				
3	Week
4	Month			
5	Year		
6	One off	
7	Minute	.						

As *Timer 1 Invert* inverts the timer output it can be used to give an active state of 0 instead of 1. Alternatively it can be used to give an active state of 1, but for a time period that spans the ends of the repeat period as shown in the example above. It should be noted that if this method is used to allow the active period to span the ends of the repeat period then if the timer is disabled the output of the timer block before the invert becomes 0, and so the final output of the timer after the invert is 1.

If *Date/Time Selector* (06.019) is changed and the drive is reset then the source for the timers will change, therefore *Timer 1 Repeat Function* (09.039) and *Timer 2 Repeat Function* (09.049) are reset to 0 to disable the timers and the date and time entries in the trip log are cleared.

Parameter	09.001 Logic Function 1 Output		
Short description	Shows the output state of logic function 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Logic Function 1 Output (09.001) shows the output of logic function 1.

Parameter	09.002 Logic Function 2 Output		
Short description	Shows the output state of logic function 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Logic Function 2 Output (09.002) shows the output of logic function 2.

Parameter	09.003 Motorised Pot Output		
Short description	Shows the output level of the motorised pot function		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Power Down Save	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Motorised Pot Output (09.003) shows the output of the motorised pot function.

Parameter	09.004 Logic Function 1 Source 1		
Short description	Defines input source 1 of logic function 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 1 Source 1 (09.004) defines input source 1 of logic function 1.

Parameter	09.005 <i>Logic Function 1 Source 1 Invert</i>		
Short description	Set to invert input 1 of logic function 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting *Logic Function 1 Source 1 Invert* (09.005) inverts input 1 of logic function 1.

Parameter	09.006 <i>Logic Function 1 Source 2</i>		
Short description	Defines input source 2 of logic function 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 1 Source 2 (09.006) defines input source 2 of logic function 1.

Parameter	09.007 <i>Logic Function 1 Source 2 Invert</i>		
Short description	Set to invert input 2 of logic function 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting *Logic Function 1 Source 2 Invert* (09.007) inverts input 2 of logic function 1.

Parameter	09.008 <i>Logic Function 1 Output Invert</i>		
Short description	Set to invert the output of logic function 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting *Logic Function 1 Output Invert* (09.008) inverts the output of logic function 1.

Parameter	09.009 <i>Logic Function 1 Delay</i>		
Short description	Defines the output delay of logic function 1		
Mode	RFC-A		
Minimum	-25.0	Maximum	25.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW		

Logic Function 1 Delay (09.009) defines the delay at the output of logic function 1. If *Logic Function 1 Delay* (09.009) is positive then the output does not become 1 until the input to the delay has been at 1 for the delay time. If *Logic Function 1 Delay* (09.009) is negative then the output remains at 1 until the input to the delay has been 0 for the delay time.

Parameter	09.010 Logic Function 1 Destination		
Short description	Defines the output destination of logic function 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Logic Function 1 Destination (09.010) defines the output destination of logic function 1.

Parameter	09.014 Logic Function 2 Source 1		
Short description	Defines input source 1 of logic function 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 2 Source 1 (09.014) defines input source 1 of logic function 2.

Parameter	09.015 Logic Function 2 Source 1 Invert		
Short description	Set to invert input 1 of logic function 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 2 Source 1 Invert (09.015) inverts input 1 of logic function 2.

Parameter	09.016 Logic Function 2 Source 2		
Short description	Defines input source 2 of logic function 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Logic Function 2 Source 2 (09.016) defines input source 2 of logic function 2.

Parameter	09.017 Logic Function 2 Source 2 Invert		
Short description	Set to invert input 2 of logic function 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 2 Source 2 Invert (09.017) inverts input 2 of logic function 2.

Parameter	09.018 Logic Function 2 Output Invert		
Short description	Set to invert the output of logic function 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

Setting Logic Function 2 Output Invert (09.018) inverts the output of logic function 2.

Parameter	09.019 Logic Function 2 Delay		
Short description	Defines the output delay of logic function 2		
Mode	RFC-A		
Minimum	-25.0	Maximum	25.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW		

Logic Function 2 Delay (09.019) defines the delay at the output of logic function 1. If Logic Function 2 Delay (09.019) is positive then the output does not become 1 until the input to the delay has been at 1 for the delay time. If Logic Function 2 Delay (09.019) is negative then the output remains at 1 until the input to the delay has been 0 for the delay time.

Parameter	09.020 Logic Function 2 Destination		
Short description	Defines the output destination of logic function 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Logic Function 2 Destination (09.020) defines the output destination of logic function 2.

Parameter	09.021 Motorised Pot Mode		
Short description	Defines the motorised pot mode		
Mode	RFC-A		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Motorised Pot Mode (09.021) defines the mode of operation as given in the table below.

<i>Motorised Pot Mode</i> (09.021)	<i>Motorised Pot Output</i> (09.003)	<i>Motorised Pot Up</i> (09.026) and <i>Motorised Pot Down</i> (09.027) active
0	Reset to zero at power-up	Always
1	Set to power-down value at power-up	Always
2	Reset to zero at power-up	When <i>Drive Active</i> (10.002) = 1
3	Set to power-down value at power-up	When <i>Drive Active</i> (10.002) = 1
4	Reset to zero at power-up and when <i>Drive Active</i> (10.002) = 0	When <i>Drive Active</i> (10.002) = 1

Parameter	09.022 Motorised Pot Bipolar Select		
Short description	Set to enable bipolar operation of the motorised pot		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Motorised Pot Bipolar Select* (09.022) = 0 then *Motorised Pot Output* (09.003) is limited in the range 0.00% to 100.00%, otherwise it is allowed to change in the range from -100.00% to 100.00%.

Parameter	09.023 Motorised Pot Rate		
Short description	Defines the rate of change of the motorised pot output		
Mode	RFC-A		
Minimum	0	Maximum	250
Default	20	Units	s
Type	8 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

The rate of change of *Motorised Pot Output* (09.003) is defined by *Motorised Pot Rate* (09.023) which gives the time to change from 0 to 100%. The time to change from -100% to 100% is *Motorised Pot Rate* (09.023) x 2.

Parameter	09.024 Motorised Pot Scaling		
Short description	Defines the scaling applied to the motorised pot output		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

Motorised Pot Scaling (09.024) introduces a scaling factor at the output of the motorised pot before the output is routed to the destination. If *Motorised Pot Scaling* (09.024) > 1.000 the output will exceed the range of the destination parameter, and so the destination parameter will be at its maximum or minimum before the output of the motorised pot reaches the limits of its range.

Parameter	09.025 <i>Motorised Pot Destination</i>		
Short description	Defines the output destination of the motorised pot		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Motorised Pot Destination (09.025) defines the output destination of the motorised pot function.

Parameter	09.026 <i>Motorised Pot Up</i>		
Short description	Set to increase the motorised pot output		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Motorised Pot Up* (09.026) = 1, then the *Motorised Pot Output* (09.003) will increase.

Parameter	09.027 <i>Motorised Pot Down</i>		
Short description	Set to decrease the motorised pot output		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Motorised Pot Down* (09.027) = 1, then the *Motorised Pot Output* (09.003) will decrease.

Parameter	09.028 <i>Motorised Pot Reset</i>		
Short description	Set to reset the motorised pot output to zero		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *Motorised Pot Reset* (09.028) = 1 then the motorised pot is disabled and held in its reset state with *Motorised Pot Output* (09.003) = 0.0%.
If *Motorised Pot Reset* (09.028) the motorised pot is enabled even if *Motorised Pot Destination* (09.025) is not routed to a valid parameter.

Parameter	09.029 <i>Binary Sum Ones</i>		
Short description	Set to add one to the binary sum output		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Binary Sum Output* (09.032).

Parameter	09.030 <i>Binary Sum Twos</i>		
Short description	Set to add two to the binary sum output		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Binary Sum Output* (09.032).

Parameter	09.031 Binary Sum Fours		
Short description	Set to add three to the binary sum output		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Binary Sum Output* (09.032).

Parameter	09.032 Binary Sum Output		
Short description	Shows the output level of the binary sum		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The binary sum function is always active even if the destination is not routed to valid a parameter. The update rate for the binary sum is always 4ms.

The output of the binary sum block is given by

$$\text{Binary Sum Output (09.032)} = \text{Binary Sum Offset (09.034)} + (\text{Binary Sum Ones (09.029)} \times 1) + (\text{Binary Sum Twos (09.030)} \times 2) + (\text{Binary Sum Fours (09.031)} \times 4)$$

Binary Sum Destination (09.033) defines the destination for the binary sum output. The routing for this destination is special if the maximum of the destination parameter $\leq 7 + [\text{Binary Sum Offset (09.034)}]$ as follows:

$$\text{Destination parameter} = \text{Binary Sum Output (09.032)}, \text{ subject to the parameter minimum}$$

Otherwise *Binary Sum Output* (09.032) is routed in the same way as any other destination where the destination target is at its full scale value when the $\text{Binary Sum Output (09.032)} = 7 + \text{Binary Sum Offset (09.034)}$

Example:

$$09.033 = 01.015$$

$$09.029 = 0$$

$$09.030 = 1$$

$$09.031 = 0$$

$$09.034 = 0$$

$$\text{So } 09.032 = 2$$

$$\text{And } 01.015 = (01.015[\text{MAX}] \times 09.032) / (7 + 09.034)$$

$$01.015 = (9 \times 2)/(7+0) = 2.57 = 3 \text{ (rounded to nearest integer)}$$

$$\text{If } 09.034 = 1 \text{ then } 01.015 = (9 \times 3)/(7+1) = 3.37 = 3 \text{ (rounded to nearest integer)}$$

$$\text{If } 09.034 = 2 \text{ then } 01.015 = (9 \times 4)/(7+2) = 4$$

Parameter	09.033 Binary Sum Destination		
Short description	Defines the output destination of the binary sum		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Binary Sum Destination (09.033) defines the destination for the binary sum output.

See *Binary Sum Output* (09.032) for more information.

Parameter	09.034 Binary Sum Offset		
Short description	Defines the offset added to the output of the binary sum		
Mode	RFC-A		
Minimum	0	Maximum	248
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Binary Sum Output* (09.032).

Parameter	09.035 Timer 1 Start Date		
Short description	Defines the start date for timer 1		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 1 Start Date (09.035) defines the start time within the repeat period of timer 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.036 Timer 1 Start Time		
Short description	Defines the start time for timer 1		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 1 Start Time (09.036) defines the start time within the repeat period of timer 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.037 Timer 1 Stop Date		
Short description	Defines the stop date for timer 1		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 1 Stop Date (09.037) defines the stop date within the repeat period of timer 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.038 Timer 1 Stop Time		
Short description	Defines the stop time for timer 1		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 1 Stop Time (09.038) defines the stop time within the repeat period of timer 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.039 Timer 1 Repeat Function		
Short description	Defines the length of the repeat period		
Mode	RFC-A		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	Hour
2	Day
3	Week
4	Month
5	Year
6	One off
7	Minute

Timer 1 Repeat Function (09.039) defines the length of the repeat period. For example if *Timer 1 Repeat Function* (09.039) = 2 then the repeat period is one day. The output is inactive until the time reaches the hour, minute and second defined in *Timer 1 Start Time* (09.036), and remains active until the time reaches the hour, minute and second defined in *Timer 1 Stop Time* (09.038). Different repeat periods may be selected as given in the table below. The table shows the constituent parts of the date and time that are used to determine the start and stop events. If the repeat period is set to every week then *Timer 1 Start Date* (09.035) and *Timer 1 Stop Date* (09.037) define the day of the week and not the date (i.e. 00.00.00 = Sunday, 00.00.01 = Monday, etc.). If the stop time event is set to occur at or before the start time event or the *Timer 1 Repeat Function* (09.039) = 0 or *Timer 1 Enable* (09.040) = 0 the output remains inactive at all times (i.e. *Timer 1 Output* (09.042) = 0 if *Timer 1 Invert* = 0).

Timer 1 Repeat Function (09.039)	Repeat period	Second	Minute	Hour	Day	Month	Year	Day of week
0	None							
1	Hour	.	.					
2	Day	.	.	.				
3	Week
4	Month			
5	Year		
6	One off	
7	Minute	.						

Parameter	09.040 Timer 1 Enable		
Short description	Set to enable the timer 1 function		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 1 Enable (09.040) enables the timer 1 function. If *Timer 1 Enable* (09.040) = 0, then the output of the timer is always inactive, i.e. *Timer 1 Output* (09.042) = 0.

Parameter	09.041 Timer 1 Invert		
Short description	Set to invert the output of timer 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 1 Invert (09.041) inverts the timer output to give an active state of 0 instead of 1. Alternatively it can be used to give an active state of 1, but for a

time period that spans the ends of the repeat period as shown in the example above. It should be noted that if this method is used to allow the active period to span the ends of the repeat period then if the timer is disabled the output of the timer block before the invert becomes 0, and so the final output of the timer after the invert is 1.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.042 Timer 1 Output		
Short description	Shows the output state of timer function 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Timer 1 Output (09.042) shows the output of the timer function 1.

Parameter	09.043 Timer 1 Destination		
Short description	Defines the output destination of timer function 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Timer 1 Destination (09.043) defines the output destination of timer function 1.

Parameter	09.045 Timer 2 Start Date		
Short description	Defines the start date for timer 2		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 2 Start Date (09.045) defines the start date within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.046 Timer 2 Start Time		
Short description	Defines the start time for timer 2		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 2 Start Time (09.046) defines the start time within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.047 Timer 2 Stop Date		
Short description			
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default	0 (Display: 00-00-00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Date	Decimal Places	0
Coding	RW		

Timer 2 Stop Date (09.047) defines the stop date within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.048 Timer 2 Stop Time		
Short description	Defines the stop time for timer 2		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default	0 (Display: 00:00:00)	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Time	Decimal Places	0
Coding	RW		

Timer 2 Stop Time (09.048) defines the stop time within the repeat period of timer 2.

See *Timer 1 Repeat Function* (09.039) for more information.

Parameter	09.049 Timer 2 Repeat Function		
Short description	Defines the length of the repeat period		
Mode	RFC-A		
Minimum	0	Maximum	7
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	Hour
2	Day
3	Week
4	Month
5	Year
6	One off
7	Minute

See *Timer 1 Repeat Function* (09.039).

Parameter	09.050 Timer 2 Enable		
Short description	Set to enable the timer 2 function		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 2 Enable (09.050) enables the timer 2 function. If *Timer 2 Enable* (09.050) = 0, then the output of the timer is always inactive, i.e. *Timer 2 Output* (09.052) = 0.

Parameter	09.051 Timer 2 Invert		
Short description	Set to invert the output of timer 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Timer 2 Invert (09.051) inverts the timer output to give an active state of 0 instead of 1.

See *Timer 1 Invert* (09.041) for more information.

Parameter	09.052 Timer 2 Output		
Short description	Shows the output state of timer function 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Timer 2 Output (09.052) shows the output of timer function 2.

Parameter	09.053 Timer 2 Destination		
Short description	Defines the output destination of timer function 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

Timer 2 Destination (09.053) defines the output destination of timer function 2.

Parameter	09.055 Scope Trace 1 Source		
Short description	Defines the source of scope trace 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Up to four scope sources can be selected using *Scope Trace 1 Source* (09.055) to *Scope Trace 4 Source* (09.058). If the source value is set to 0.000, or the source parameter does not exist or is non-visible, then no source is selected. The sources do not operate in the same way as normal source parameters in that the input to the scope is the actual value of the parameter and not a value scaled to a percentage based on the range of the parameter. If a scope trace source parameter is modified the actual change is not effective until the drive is reset.

Parameter	09.056 Scope Trace 2 Source		
Short description	Defines the source of scope trace 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Scope Trace 1 Source* (09.055).

Parameter	09.057 Scope Trace 3 Source		
Short description	Defines the source of scope trace 3		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Scope Trace 1 Source* (09.055).

Parameter	09.058 Scope Trace 4 Source		
Short description	Defines the source of scope trace 3		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Scope Trace 1 Source* (09.055).

Parameter	09.059 Scope Trigger		
Short description	Set to trigger the scope function		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW		

The scope is triggered by a rising edge at the input to the main scope block. If *Scope Trigger Source* (09.060) is set at its default value of 0.000 then the

output of the trigger threshold comparator is 0, and so the scope can be triggered with *Scope Trigger* (09.059). *Scope Trigger Invert* (09.062) can be used to invert the trigger signal.

Parameter	09.060 <i>Scope Trigger Source</i>		
Short description	Defines the source of the scope trigger		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

If *Scope Trigger* (09.059) = 0, the scope can be triggered based on the level of a parameter defined by *Scope Trigger Source* (09.060) and the *Scope Trigger Threshold* (09.061). This source operates in the same way as the trace sources and a direct comparison is made between the actual parameter value and the threshold. Decimal places are ignored. The threshold detector output is 1 when the value from the scope trigger source is greater than *Scope Trigger Threshold* (09.061). If *Scope Trigger Source* (09.060) = 0.000, or it is used to select a parameter that does not exist or is non-visible, then the output of the threshold detector is 0.

Parameter	09.061 <i>Scope Trigger Threshold</i>		
Short description	Defines the scope trigger threshold		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default	0	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Scope Trigger Source* (09.060).

Parameter	09.062 <i>Scope Trigger Invert</i>		
Short description	Set to invert the scope trigger		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Scope Trigger* (09.059).

Parameter	09.063 <i>Scope Mode</i>		
Short description	Defines the mode of the scope		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Single
1	Normal
2	Auto

Single (0):

If *Scope Arm* (09.064) is set to 1 the scope starts to acquire pre-trigger data (i.e. enough data to provide information for the pre-trigger period) and *Scope Data Not Ready* (09.065) is set to 1. The scope can then be triggered on the next trigger event (i.e. a rising edge on the trigger input of the main scope block). Note that the scope can only be triggered once the required amount of pre-trigger data has been sampled. Failure to do this will result in the scope function not triggering correctly. When the trigger event occurs *Scope Arm* (09.064) is set to 0, and when the post-trigger data has been stored *Scope Data Not Ready* (09.065) is set to 0. If *Scope Auto-save Mode* (09.070) is non-zero, the data in the scope trace buffer is saved to a non-volatile media card fitted in the drive. When the save is complete (or data cannot be saved, i.e. no card fitted or no space left) the scope is ready again to receive data. If *Scope Arm* (09.064) is set to 1 the scope will start to acquire data again.

It is possible to read scope files via comms or into an option module. However, scope file transfer can only be initiated when *Scope Arm (09.064) = 0*, *Scope Data Not Ready (09.065) = 0*, *Scope Saving Data (09.066) = 0* and at least one trace has been set up. While the file transfer is in progress *Scope Saving Data (09.066)* is set to 1.

The scope system is reset under any of the following conditions:

1. At power-up.
2. If the drive is reset when *Scope Trace 1 Source (09.055)* to *Scope Trace 4 Source (09.058)* have been modified.
3. The drive mode is changed.
4. If *Scope Mode (09.063)*, *Scope Sample Time (09.067)* or *Scope Trigger Delay (09.068)* are modified.

When the scope is reset *Scope Arm (09.064)* is reset to 0 and the trace data is all cleared to 0..

Normal (1):

The scope operates in the same way as single mode except that *Scope Arm (09.064)* is automatically set back to 1 after a time delay of 1s once the post-trigger data has been acquired, and the scope data has been saved to a non-volatile media card if *Scope Auto-save Mode (09.070) > 0*.

Auto (2):

After the scope system is reset *Scope Data Not Ready (09.065)* is set to 1 and the scope begins to acquire data. Once the buffer is full *Scope Data Not Ready (09.065)* is set to 0 and the scope continues to acquire data. *Scope Arm (09.064)* has no effect on data acquisition. Provided *Scope Data Not Ready (09.065) = 0* and *Scope Saving Data (09.066) = 0* it is possible to read the data from the scope buffer as a scope file. Data acquisition is stopped when the file transfer begins. When the file transfer is complete, data acquisition begins again and *Scope Data Not Ready (09.065)* is set to 1 for a period that is long enough to fill the scope buffer with new data.

Parameter	09.064 Scope Arm		
Short description	Set to arm the scope		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	250µs read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

See *Scope Mode (09.063)*.

Parameter	09.065 Scope Data Not Ready		
Short description	Shows that the data in the scope buffer is not ready to be read out		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	250µs write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Scope Mode (09.063)*.

Parameter	09.066 Scope Saving Data		
Short description	Shows when the scope is saving data		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Scope Mode (09.063)*.

Parameter	09.067 Scope Sample Time		
Short description	Defines the sample time of the scope		
Mode	RFC-A		
Minimum	1	Maximum	200
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Scope Sample Time (09.067) defines the sample rate of the scope function for all traces in 1m units (i.e. if *Scope Sample Time* (09.067) = 4, the sample time is 4ms).

Parameter	09.068 Scope Trigger Delay		
Short description	Defines how much pre-trigger data is stored by the scope		
Mode	RFC-A		
Minimum	0	Maximum	100
Default	0	Units	%
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Scope Trigger Delay (09.068) defines how much data is stored before and after the scope is triggered. If *Scope Trigger Delay* (09.068) = 0% then no data is stored before the trigger and all the data is after the trigger. If *Scope Trigger Delay* (09.068) = 100% then no data is stored after the trigger, but all the data is before the trigger.

Parameter	09.069 Scope Time Period		
Short description	Shows the time period covered by the scope buffer		
Mode	RFC-A		
Minimum	0.00	Maximum	200000.00
Default		Units	ms
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

The scope function can capture up to 4000 bytes of parameter data. The *Scope Time Period* (09.069) gives the length of the time period covered by the scope buffer which depends on the number of traces stored, the sample time and the size of the parameters used as trace sources.

$$\text{Scope Time Period (09.069)} = 4000 \times 1\text{ms} \times \text{Scope Sample Time (09.067)} / \text{Size of trace data}$$

Size of trace data is the sum of the number of bytes in each of the trace sources selected by *Scope Trace 1 Source* (09.055) to *Scope Trace 4 Source* (09.058).

Parameter	09.070 Scope Auto-save Mode		
Short description	Defines the mode for auto-saving scope files to the NV media card		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disabled
1	Overwrite
2	Keep

Auto-save mode can be used to store a scope file on a non-volatile media card at each trigger event. The auto-save system is held in reset if *Scope Auto-save Reset* (09.072) = 1. When the auto-save system is reset all the scope files in scope file folder on the NV media card are deleted, *Scope Auto-save File Number* (09.071) is reset to 0 and the auto-save system is inactive. If any of the file operations fail during reset *Scope Auto-save Status* (09.073) is 3 (Failed) when the reset is removed.

The following conditions must be met for auto-saving to be active:

1. *Scope Auto-save Mode* (09.070) is non-zero
2. *Scope Auto-save Reset* (09.072) = 0
3. *Scope Auto-save Status* (09.073) = 1 (Active)
4. *Scope Mode* (09.063) = 0 (Single) or 1 (Normal)

If auto-saving is active an attempt is made to copy the scope file to a non-volatile media card fitted to the drive each time the post-trigger data has been acquired. The file name is SCP00XY.DAT, where XY is defined by *Scope Auto-save File Number* (09.071). If *Scope Auto-save Mode* (09.070) = 1 (Overwrite) then a file is over-written if it already exists. If *Scope Auto-save Mode* (09.070) = 2 (Keep) then if the file already exists the auto-save process is aborted. *Scope Auto-save File Number* (09.071) is incremented after a file is saved successfully and rolls over to 0 if it exceeds its maximum value.

If *Scope Auto-save Status* (09.073) = 0 (Disabled) and all the other conditions listed above for auto-saving to be active are met, then *Scope Auto-save Status* (09.073) changes to 1 (Active), so that auto-saving becomes active. If the scope file cannot be saved because the file exists and *Scope Auto-save Mode* (09.070) = 2 (Keep) then *Scope Auto-save Status* (09.073) is set to 2 (Stopped). If the scope file cannot be saved for any other reason then *Scope Auto-save Status* (09.073) is set to 3 (Failed). If *Scope Auto-save Status* (09.073) is no longer 1 (Active), auto-saving is aborted. Auto-saving can be made active again by setting *Scope Auto-save Reset* (09.072) to 1 and then to 0. If *Scope Auto-save Mode* (09.070) = 0 (Disabled) then *Scope Auto-save Status* (09.073) is set to 0 (Disabled), or if *Scope Auto-save Mode* (09.070) is non-zero then *Scope Auto-save Status* (09.073) is set to 1 (Active). It should be noted that *Scope Auto-save Status* (09.073) is a power-down save parameter, and so auto-save will remain inactive if *Scope Auto-save Status* (09.073) is 2 or 3 even if the drive is powered down and then powered up again.

Parameter	09.071 <i>Scope Auto-save File Number</i>		
Short description	Shows the file number to be used for the next auto-saved scope file		
Mode	RFC-A		
Minimum	0	Maximum	99
Default	0	Units	
Type	8 Bit Power Down Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RO		

See *Scope Auto-save Mode* (09.070).

Parameter	09.072 <i>Scope Auto-save Reset</i>		
Short description	Set to reset the scope auto-save function		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Scope Auto-save Mode* (09.070).

Parameter	09.073 <i>Scope Auto-save Status</i>		
Short description	Shows the status of the scope auto-save function		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE		

Value	Text
0	Disabled
1	Active
2	Stopped
3	Failed

See *Scope Auto-save Mode* (09.070).

Menu 10 – Status and Trips

Mode: RFC-A

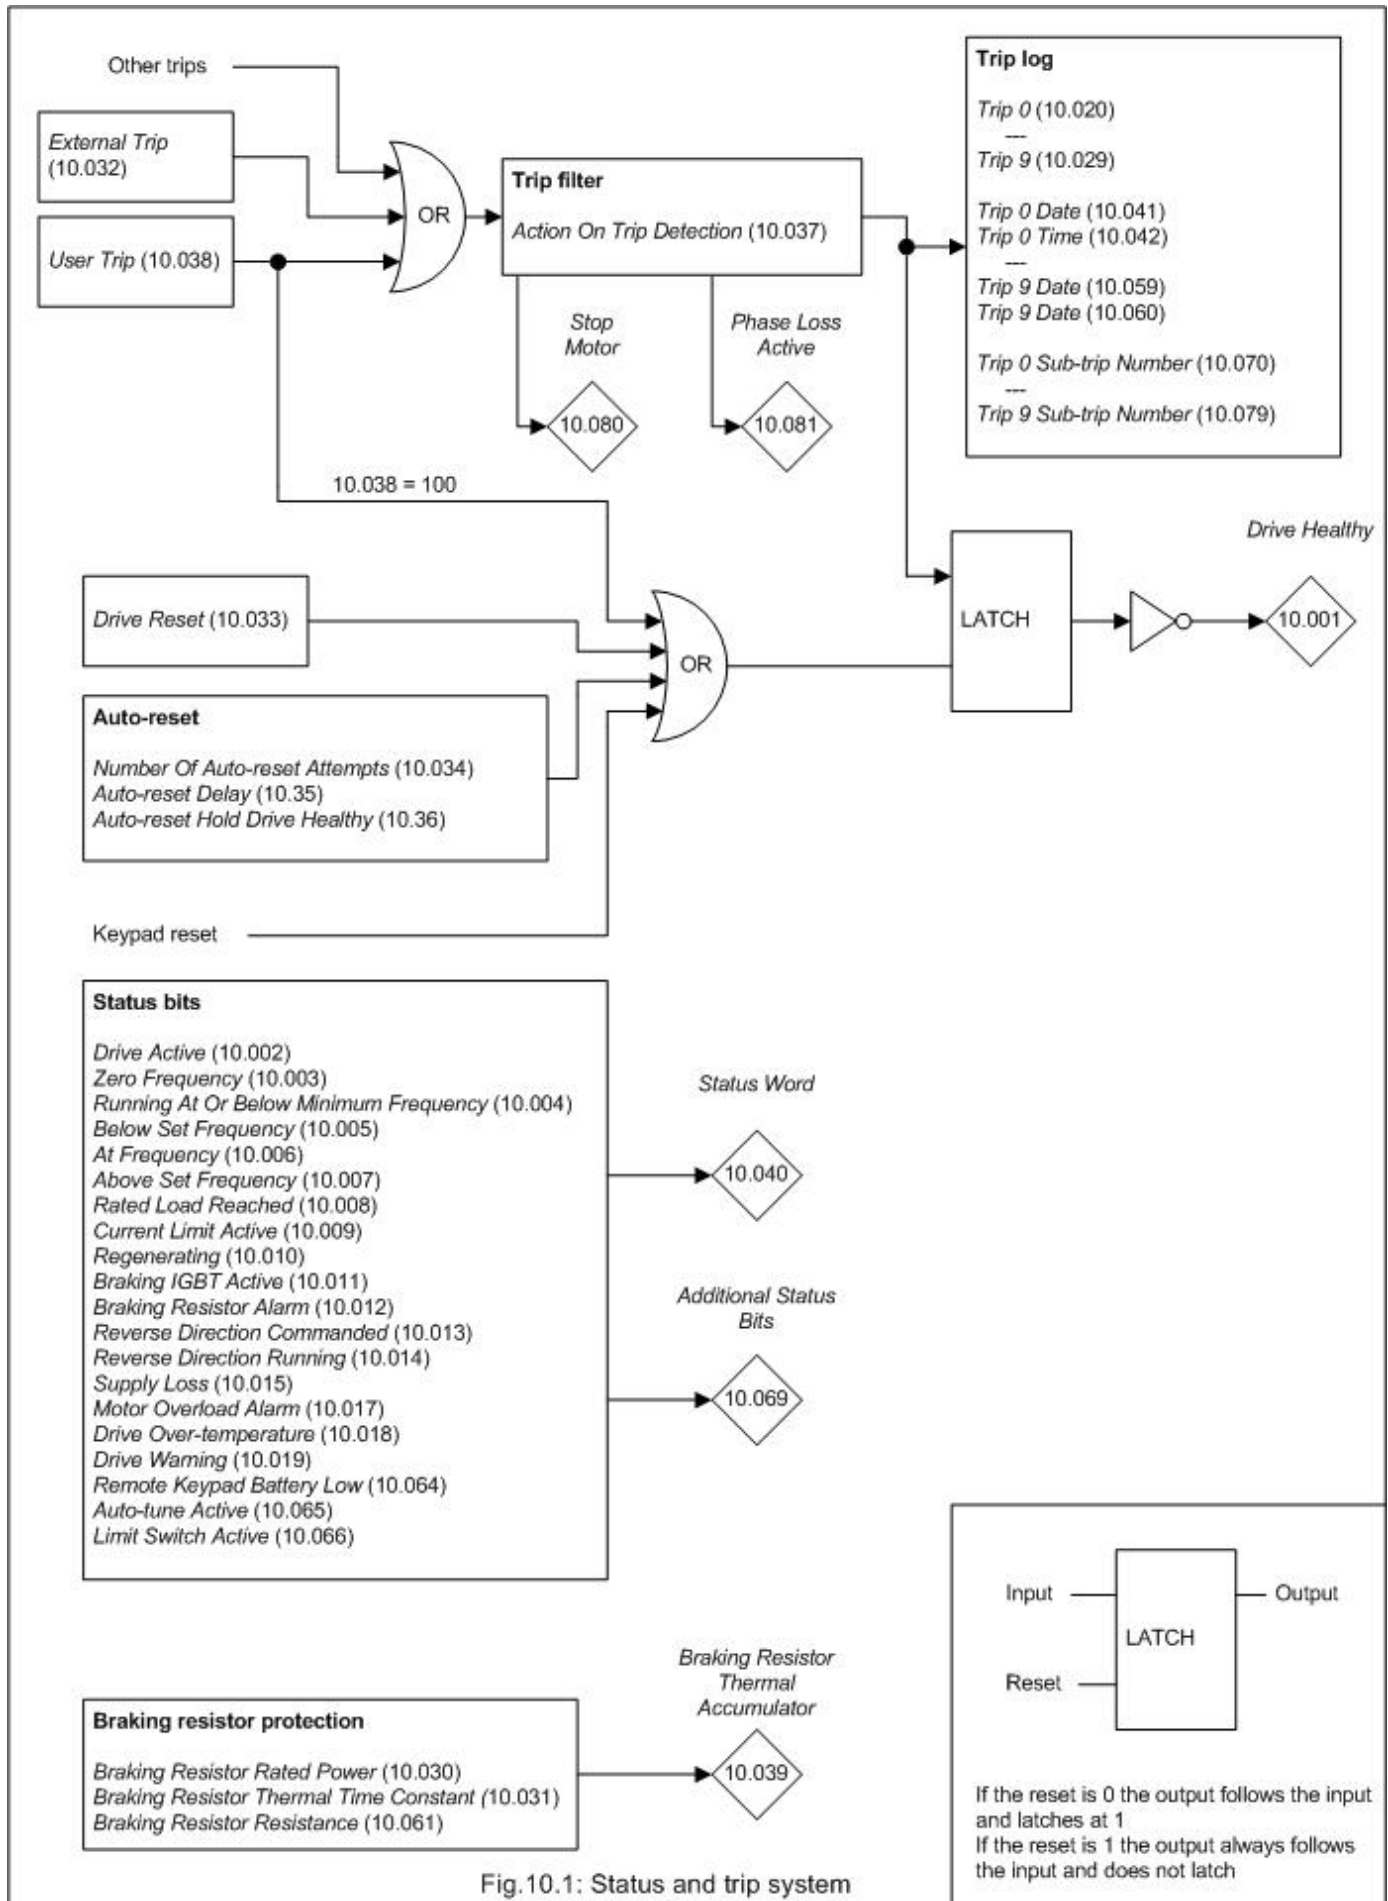

Fig.10.1: Status and trip system

Parameter	10.001 Drive Healthy		
Short description	Indicates that the drive is healthy		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Drive Healthy (10.001) indicates that the drive is not in the trip or the under voltage state if it is set to one. If *Auto-reset Hold Drive Healthy* (10.036) = 1 and auto-reset is being used, *Drive Healthy* (10.001) is not cleared until all auto-resets have been attempted and the next trip occurs.

Parameter	10.002 Drive Active		
Short description	Indicates that the inverter is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

If the drive inverter is active *Drive Active* (10.002) is set to one, otherwise it is zero.

Parameter	10.003 Zero Frequency		
Short description	Indicates that the frequency is below the zero frequency threshold		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Zero Frequency (10.003) is set to one under the zero frequency conditions, otherwise it is zero. See *Zero Frequency Threshold* (03.005).

Parameter	10.004 Running At Or Below Minimum Frequency		
Short description	Indicates that the drive is running at or below the minimum frequency		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

If *Bipolar Reference Enable* (01.010) = 1 then *Running At Or Below Minimum Frequency* (10.004) operates in the same way as *Zero Frequency* (10.003). If *Bipolar Reference Enable* (01.010) = 0 then *Running At Or Below Minimum Frequency* (10.004) is set if *Estimated Frequency* (03.002) \leq *Minimum Reference Clamp* (01.007) + 0.5Hz.

If motor map 2 is active then *M2 Minimum Reference Clamp* (21.002) is used instead of *Minimum Reference Clamp* (01.007).

Parameter	10.005 Below Set Frequency		
Short description	Indicates that the drive is running below the set frequency		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *At Frequency Lower Limit* (03.006).

Parameter	10.006 At Frequency		
Short description	Indicates that the drive is running at the set frequency		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *At Frequency Lower Limit* (03.006).

Parameter	10.007 <i>Above Set Frequency</i>		
Short description	Indicates that the drive is running above the set frequency		
Mode	RFC-A		
Minimum	0	Maximum	1
Default			Units
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *At Frequency Lower Limit* (03.006).

Parameter	10.008 <i>Rated Load Reached</i>		
Short description	Indicates that rated load has been reached		
Mode	RFC-A		
Minimum	0	Maximum	1
Default			Units
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Rated Load Reached (10.008) is set to one when the torque producing current is at or above its rated level. This condition is detected when the modulus of *Percentage Load* (04.020) is greater or equal to 100.0%. It should be noted that this is an indication based on the level of current and not torque, which means that if field weakening is active a value of one in *Rated Load Reached* (10.008) does not necessarily mean that the motor is producing rated torque.

Parameter	10.009 <i>Current Limit Active</i>		
Short description	Indicates that the current limit is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default			Units
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Current Limit Active (10.009) is set to one if the current limit is active.

Parameter	10.010 <i>Regenerating</i>		
Short description	Indicates that power is being transferred from the motor to the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default			Units
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Regenerating (10.010) is set to one if power is being transferred from the motor to the drive

Parameter	10.011 <i>Braking IGBT Active</i>		
Short description	Indicates that the braking IGBT is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default			Units
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Braking IGBT Active (10.011) is set to one if the braking IGBT is active. As the braking IGBT active periods may be short, each time the braking IGBT is switched on *Braking IGBT Active* (10.011) is set to one and remains at one for at least 0.5s.

Parameter	10.012 <i>Braking Resistor Alarm</i>		
Short description	Indicates that the braking IGBT is active and the braking resistor thermal accumulator is greater than 75%		
Mode	RFC-A		
Minimum	0	Maximum	1
Default			Units
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Braking Resistor Alarm (10.012) is set when the braking IGBT is active and *Braking Resistor Thermal Accumulator* (10.039) is greater than 75.00%. As the braking IGBT on periods may be short *Braking Resistor Alarm* (10.012) is always held on for at least 0.5s.

Parameter	10.013 Reverse Direction Commanded		
Short description	Indicates that the reverse direction has been commanded		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Reverse Direction Commanded (10.013) indicates the reference direction at the input to the ramp system. If the *Pre-ramp Reference* (01.003) is negative *Reverse Direction Commanded* (10.013) is one otherwise *Reverse Direction Commanded* (10.013) is zero.

Parameter	10.014 Reverse Direction Running		
Short description	Indicates that the drive is running in the reverse direction		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Reverse Direction Running (10.014) is set to one if the *Estimated Frequency* (03.002) is negative otherwise it is set to zero.

Parameter	10.015 Supply Loss		
Short description	Indicates that the drive is in the supply loss state		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Supply Loss (10.015) indicates that the drive is in the supply loss state. This condition can only occur if supply loss detection is enabled, i.e. *Supply Loss Mode* (06.003) is set to a non-zero value. In the supply loss state the drive will attempt to stop the motor.

Parameter	10.016 Under Voltage Active		
Short description	Indicates that the drive is in the under voltage state		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Under Voltage Active (10.016) indicates that the drive is in the under voltage state.

Parameter	10.017 Motor Overload Alarm		
Short description	Indicates that the motor overload accumulator is above 75% and the output current is high		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Motor Overload Alarm (10.017) is set if the drive output current is higher than the level that will eventually cause an *It(ac)* trip and the *Motor Protection Accumulator* (04.019) for motor control. See *Motor Thermal Time Constant 1* (04.015) for motor control modes for more details.

Parameter	10.018 Drive Over-temperature Alarm		
Short description	Indicates that the drive over-temperature alarm is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Drive Over-temperature Alarm (10.018) is set if Percentage Of Drive Thermal Trip Level (07.036) is greater than 90%.

Parameter	10.019 Drive Warning		
Short description	Indicates that one or more of the drive warning alarms are active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default			Units
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Drive Warning (10.019) is set to one if any of the drive warnings is active it is defined as

Drive Warning (10.019) = Braking Resistor Alarm (10.012) OR Motor Overload Alarm (10.017) OR Drive Over-temperature Alarm (10.018) OR Low AC Alarm (10.107)

Parameter	10.020 Trip 0		
Short description	Shows the current or last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default			Units
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU

Trip 0 (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is

the oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost.

The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017) (See *Date/Time Selector* (06.019)). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

Trip categories and priorities

Trips are grouped into the categories given in the table below. A trip can only occur when the drive is not tripped, or if it is already tripped and the new trip has a higher priority than the active trip (i.e. lower priority number). Unless otherwise stated a trip cannot be reset until 1.0s after it has been initiated.

Priority	Category	Trips	Comments
1	Internal faults	HF01 - HF19	These are fatal problems that cannot be reset. All drive features are inactive after any of these trips occur. If a basic keypad is fitted it will show the trip, but the keypad will not function. These trips are not stored in the trip log.
1	Stored HF trip	<i>Stored HF</i>	This trip cannot be cleared unless 1299 is entered into <i>Parameter mm.000</i> (mm.000) and a reset is initiated.
2	Non-resettable trips	Trip numbers 218 - 247 and <i>Slot1 HF</i>	These trips cannot be reset.
3	Volatile memory failure	<i>EEPROM Fail</i>	This can only be reset if <i>Parameter mm.000</i> (mm.000) is set to 1233 or 1244, or if <i>Load Defaults</i> (11.043) is set to a non-zero value
4	Non-volatile media trips	Trip numbers 174, 175 and 177 - 188	These trips are priority 5 during power-up
5	Trips with extended reset times	<i>OI ac</i> , <i>OI Brake</i> and <i>Reserved</i>	These trips cannot be reset until 10s after the trip was initiated.
5	Phase loss and d.c. link power circuit protection	<i>Phase Loss</i> and <i>OHT dc bus</i>	The drive will attempt to stop the motor before tripping if a <i>Phase Loss.000</i> trip occurs unless this feature has been disabled (see <i>Action On Trip Detection</i> (10.037)). The drive will always attempt to stop the motor before tripping if an <i>OHT dc bus</i> occurs.
5	Standard trips	All other trips	

Trips {HF01} to {HF19} are internal faults that do not have trip numbers. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. The error can only be reset by powering the drive down and up again. The table below gives the reasons for internal faults and their corresponding trip

Trip	Reason	
{HF01}	CPU hardware fault during exception processing	
{HF02}	CPU memory management fault is an exception that occurs because of a memory protection related fault	
{HF03}	CPU has detected a Bus Fault. A Bus Fault is an exception that occurs because of a memory related fault for an instruction or data memory transaction. This might be from an error detected on a bus in the memory system.	
{HF04}	<p>CPU has detected a usage fault: A Usage Fault is an exception that occurs because of a fault related to instruction execution. This includes:</p> <ul style="list-style-type: none"> • an undefined instruction • an illegal unaligned access • invalid state on instruction execution • an error on exception return. <p>The following can cause a Usage Fault when the core is configured to report them:</p> <ul style="list-style-type: none"> • an unaligned address on word and half word memory access • division by zero. 	
{HF05}	Reserved	
{HF06}	Reserved	
{HF07}	Watchdog failure	
{HF08}	CPU Interrupt crash. Interrupt crash level indicated by subtrip number.	
{HF09}	Free store overflow	
{HF10}	Reserved	
{HF11}	The <i>HF11</i> trip indicates that a non-volatile memory comms error has occurred.	
	Sub-trip	Reason
	Recommended action	
1	Non-volatile memory comms error.	Hardware fault – contact the supplier of the drive.
2	EEPROM size is incompatible with the user firmware.	After 1min the drive will go to its bootloader. Re-program drive with compatible user firmware using UniMConnect
{HF12}	Stack overflow	
	Sub-trip	Reason
	1	User program or derivative background stack overflow
	2	User program or derivative timed stack overflow
	3	Main system interrupt stack overflow
4	Main system background stack overflow	
{HF13}	Reserved	
{HF14}	Reserved	
{HF15}	Reserved	
{HF16}	RTOS error (the background task has returned)	
{HF17}	Reserved	
	The <i>HF18</i> trip indicates that the internal flash memory has failed when writing option module parameter data. The reason for the trip can be identified by the sub-trip number.	

	Sub-trip	Reason
{HF18}	1	Option module initialization timed out
	2	Programming error while writing menu in flash
	3	Erase flash block containing setup menus failed
	4	Erase flash block containing application menus failed
	5	Incorrect setup menu CRC contained in flash
	6	Incorrect application menu CRC contained in flash
{HF19}	The <i>HF19</i> trip indicates that the drive firmware is partially or completely deleted. The drive is now in its bootloader and is waiting for a new image to be downloaded using UniMConnect. Once a new image is downloaded, the drive can run normally.	

When the drive is subsequently powered up a *Stored HF* trip is initiated where the sub-trip number is the number of the HF trip that last occurred. This trip will occur at every power-up until it is reset. The trip can only be reset by first entering 1299 into *Parameter mm.000* (mm.000). If the drive is powered up and a *Stored HF* trip occurs, *Onboard User Program: Enable* (11.047) is reset to zero to prevent the on-board user program from running. This ensures that the user program can be changed or erased in case it causes an HF trip at every power-up

Trip descriptions

Trips shown in the table below can be generated either from the drive control system or from the power system. The sub-trip number which is in the form *xyzz* is used to identify the source of the trip. The digits *xx* are 00 for a trip generated by the control system or the number of a power module if generated by the power system. If the drive is not a multi-power module drive then *xx* will always have a value of 1 the trip is related to the power system. The *y* digit is used to identify the location of a trip which is generated by a rectifier module connected to a power module. Where the *y* digit is relevant it will have a value of 1 or more, otherwise it will be 0. The *zz* digits give the reason for the trip and are defined in each trip description.

<i>Over Volts</i>	<i>OHT dc bus</i>
<i>OI ac</i>	<i>Phase Loss</i>
<i>OI Brake</i>	<i>LF Power Comms</i>
<i>PSU</i>	<i>OI Snubber</i>
<i>OHT Inverter</i>	<i>Reserved</i>
<i>OHT Power</i>	<i>Temp Feedback</i>
	<i>Power Data</i>

Parameter	10.021 Trip 1		
Short description	Shows the 2nd from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.022 Trip 2		
Short description	Shows the 3rd from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.023 Trip 3		
Short description	Shows the 4th from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.024 Trip 4		
Short description	Shows the 5th from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.025 Trip 5		
Short description	Shows the 6th from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.026 Trip 6		
Short description	Shows the 7th from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.027 Trip 7		
Short description	Shows the 8th from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.028 Trip 8		
Short description	Shows the 9th from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.029 Trip 9		
Short description	Shows the 10th from last trip to have occurred		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

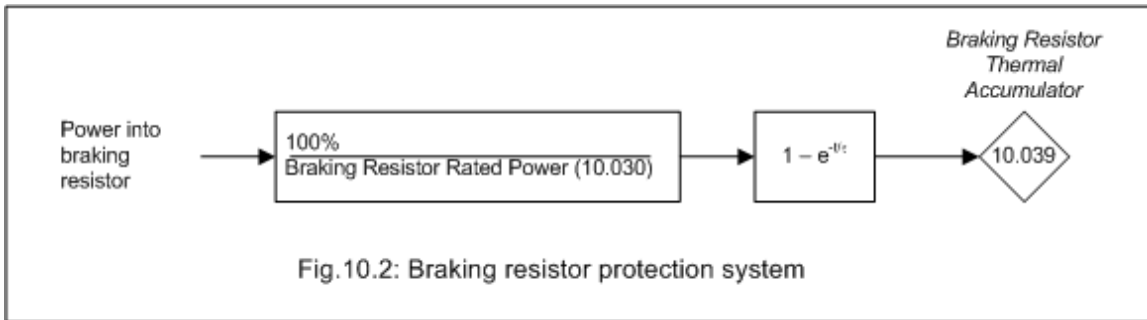

See Trip 0 (10.020).

Parameter	10.030 Braking Resistor Rated Power		
Short description	Set to the rated power of the braking resistor		
Mode	RFC-A		
Minimum	0.0	Maximum	99999.9
Default	0.0	Units	kW
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

A thermal protection system is provided for the braking resistor. If *Braking Resistor Rated Power* (10.030) is set to zero this protection system is disabled and the *Braking Resistor Thermal Accumulator* (10.039) is held at zero. If braking resistor thermal protection is required the *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061) should be set up with the braking resistor parameters. The thermal time constant of the resistor can be calculated from the single pulse energy rating (E) and continuous power rating (P) of the resistor.

$$\text{Braking Resistor Thermal Time Constant (10.031)} = \tau = E / P$$

The braking resistor is protected with a single time constant model as shown below.

The drive monitors the power flowing into the braking resistor and updates the *Braking Resistor Thermal Accumulator* (10.039). If bit 1 of *Action On Trip Detection* (10.037) = 0 and the accumulator reaches 100% an *Brake R Too Hot* trip is initiated. If bit 1 of *Action On Trip Detection* (10.037) = 1 and the accumulator reaches 100% the braking IGBT is disabled until the accumulator falls below 95.0%.

Parameter	10.031 Braking Resistor Thermal Time Constant		
Short description	Set to the thermal time constant of the braking resistor		
Mode	RFC-A		
Minimum	0.00	Maximum	1500.00
Default	0.00	Units	s
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Braking Resistor Rated Power* (10.030) .

Parameter	10.032 External Trip		
Short description	Set to initiate an external trip		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *External Trip* (10.032) is set to one an *External Trip.003* is initiated. A digital input can be routed to *External Trip* (10.032) to provide an external trip input function.

Parameter	10.033 Drive Reset		
Short description	Set to initiate a drive reset		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

A 0 to 1 transition in *Drive Reset* (10.033) causes a drive reset. If a drive reset terminal is required a digital input should be routed to *Drive Reset* (10.033).

Parameter	10.034 Number Of Auto-reset Attempts		
Short description	Set to the number of required auto-reset attempts		
Mode	RFC-A		
Minimum	0	Maximum	6
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	None
1	1
2	2
3	3
4	4
5	5
6	Infinite

If *Number Of Auto-reset Attempts* (10.034) = 0 then no auto-reset attempts are made. Any other value will cause the drive to automatically reset following a trip for the number of times programmed after a delay defined by *Auto-reset Delay* (10.035) subject to the minimum reset time allowed for the type of trip. Note that for some trips the minimum is 10s. The auto-reset count is only incremented when the trip is the same as the previous trip otherwise it is reset to 0. When the auto-reset count reaches the programmed value, any further trip of the same value will not cause an auto-reset. If there has been no trip for 5 minutes then the auto-reset count is cleared. Auto reset will not occur after any trips with priority levels 1, 2 or 3 as defined in Section 4. When a manual reset occurs the auto-reset counter is reset to zero.

If *Number Of Auto-reset Attempts* (10.034) = 6 the auto-reset counter is held at zero, and so there is no limit on the number of auto-reset attempts.

Parameter	10.035 Auto-reset Delay		
Short description	Set to the required auto-reset delay		
Mode	RFC-A		
Minimum	1.0	Maximum	600.0
Default	1.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

See *Number Of Auto-reset Attempts* (10.034).

Parameter	10.036 Auto-reset Hold Drive Healthy		
Short description	Set to hold drive healthy if further auto-reset attempts are possible		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

If *Auto-reset Hold Drive Healthy* (10.036) = 0 then *Drive Healthy* (10.001) is cleared every time the drive trips regardless of any auto-reset that may occur. If *Auto-reset Hold Drive Healthy* (10.036) = 1 then *Drive Healthy* (10.001) is not cleared on a trip if any further auto-reset attempts are possible. Note that if the under voltage state becomes active *Drive Healthy* (10.001) is always set to zero.

Parameter	10.037 Action On Trip Detection		
Short description	Defines the action of the drive on detection of a trip		
Mode	RFC-A		
Minimum	0 (Display: 00000)	Maximum	31 (Display: 11111)
Default	0 (Display: 00000)	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Binary	Decimal Places	0
Coding	RW		

The bits in *Action On Trip Detection* (10.037) are defined as follows:

Bit 0: Stop on defined non-important trips

If bit 0 is set to one the drive will attempt to stop before tripping if any of the following trip conditions are detected: *I/O Overload*, *Keypad Mode*, *Motor Too Hot*, *EEPROM Fail* or user 24V failure.

Bit 1: Disable braking resistor overload detection

See *Braking Resistor Rated Power* (10.030).

Bit 2: Disable phase loss stop

Normally the drive will stop when the input phase loss condition is detected. If this bit is set to 1 the drive will continue to run and will only trip when the drive is brought to a stop by the user.

Bit 3: Disable braking resistor temperature monitoring

If hardware based braking resistor thermal monitoring is provided this can be disabled by setting this bit to one.

Bit 4: Disable parameter freeze on trip

If this bit is 0 then the parameters listed below are frozen on trip until the trip is cleared. If this bit is 1 then this feature is disabled.

<i>Reference Selected</i> (01.001)
<i>Pre-skip Filter Reference</i> (01.002)
<i>Pre-ramp Reference</i> (01.003)
<i>Frequency Reference</i> (03.045)
<i>Estimated Frequency</i> (03.002)
<i>Frequency Error</i> (03.003)
<i>Frequency Controller Output</i> (03.004)
<i>Current Magnitude</i> (04.001)
<i>Torque Producing Current</i> (04.002)
<i>Magnetising Current</i> (04.017)
<i>Output Frequency</i> (05.001)
<i>Output Voltage</i> (05.002)
<i>Output Power</i> (05.003)
<i>D.c. Link Voltage</i> (05.005)
<i>Analogue Input 1</i> (07.001)
<i>Analogue Input 2</i> (07.002)

Parameter	10.038 User Trip		
Short description	Defines which user trip is to occur		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, BU		

When a value other than zero is written to the *User Trip* (10.038) the actions described in the following table are performed. The drive immediately writes the value back to zero. If the value is not included in the table, then the action is the same as if the trip with the same number (with sub-trip zero) occurred provided the drive is not already tripped.

Because the drive clears immediately this parameter to 0, the value must be written via serial communication or user program if supported.

Action	User Trip (10.038)
No action	Numbers corresponding to priority 1, 2 or 3 trips
Drive reset	100
Clear trip logs (<i>Trip 0</i> (10.020) to <i>Trip 9</i> (10.029), <i>Trip 0 Date</i> (10.041) to <i>Trip 9 Time</i> (10.060) and <i>Trip 0 Sub-trip Number</i> (10.070) to <i>Trip 9 Sub-trip Number</i> (10.079))	255

Parameter	10.039 <i>Braking Resistor Thermal Accumulator</i>		
Short description	Shows the level of the braking resistor thermal accumulator		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

See *Braking Resistor Rated Power* (10.030).

Parameter	10.040 <i>Status Word</i>		
Short description	Shows the status word for the drive		
Mode	RFC-A		
Minimum	0 (Display: 0000000000000000)	Maximum	32767 (Display: 1111111111111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

The bits in *Status Word* (10.040) mirror the status bit parameters as shown below. Where the parameters do not exist in any mode the bit remains at zero.

Bit	Status parameter
0	<i>Drive Healthy</i> (10.001)
1	<i>Drive Active</i> (10.002)
2	<i>Zero Frequency</i> (10.003)
3	<i>Running At Or Below Minimum Frequency</i> (10.004)
4	<i>Below Set Frequency</i> (10.005)
5	<i>At Frequency</i> (10.006)
6	<i>Above Set Frequency</i> (10.007)
7	<i>Rated Load Reached</i> (10.008)
8	<i>Current Limit Active</i> (10.009)
9	<i>Regenerating</i> (10.010)
10	<i>Braking IGBT Active</i> (10.011)
11	<i>Braking Resistor Alarm</i> (10.012)
12	<i>Reverse Direction Commanded</i> (10.013)
13	<i>Reverse Direction Running</i> (10.014)
14	<i>Supply Loss</i> (10.015)

Parameter	10.041 <i>Trip 0 Date</i>		
Short description	Shows the date at which trip 0 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.042 <i>Trip 0 Time</i>		
Short description	Shows the time at which trip 0 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.043 Trip 1 Date		
Short description	Shows the date at which trip 1 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.044 Trip 1 Time		
Short description	Shows the time at which trip 1 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.045 Trip 2 Date		
Short description	Shows the date at which trip 2 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.046 Trip 2 Time		
Short description	Shows the time at which trip 2 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.047 Trip 3 Date		
Short description	Shows the date at which trip 3 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.048 Trip 3 Time		
Short description	Shows the time at which trip 3 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.049 Trip 4 Date		
Short description	Shows the date at which trip 4 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.050 Trip 4 Time		
Short description	Shows the time at which trip 4 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.051 Trip 5 Date		
Short description	Shows the date at which trip 5 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.052 Trip 5 Time		
Short description	Shows the time at which trip 5 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.053 Trip 6 Date		
Short description	Shows the date at which trip 6 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.054 Trip 6 Time		
Short description	Shows the time at which trip 6 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.055 Trip 7 Date		
Short description	Shows the date at which trip 7 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.056 Trip 7 Time		
Short description	Shows the time at which trip 7 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.057 Trip 8 Date		
Short description	Shows the date at which trip 8 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.058 Trip 8 Time		
Short description	Shows the time at which trip 8 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.059 Trip 9 Date		
Short description	Shows the date at which trip 9 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00-00-00)	Maximum	311299 (Display: 31-12-99)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Date	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.060 Trip 9 Time		
Short description	Shows the time at which trip 9 occurred		
Mode	RFC-A		
Minimum	0 (Display: 00:00:00)	Maximum	235959 (Display: 23:59:59)
Default		Units	
Type	32 Bit Power Down Save	Update Rate	Write on trip
Display Format	Time	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Trip 0* (10.020).

Parameter	10.061 Braking Resistor Resistance		
Short description	Set to the resistance value of the braking resistor		
Mode	RFC-A		
Minimum	0.00	Maximum	10000.00
Default	0.00	Units	Ω
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Braking Resistor Rated Power* (10.030).

Parameter	10.064 Remote Keypad Battery Low		
Short description	Indicates that the real time clock battery in the remote keypad is low		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Remote Keypad Battery Low (10.064) is set to one when a keypad is connected to the drive user comms port with an internal real-time clock and the battery is not fitted or the voltage is below the minimum threshold.

Parameter	10.065 Auto-tune Active		
Short description	Indicates that an auto-tune sequence is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Auto-tune Active (10.065) is set to one while an auto-tune sequence is active.

Parameter	10.066 Limit Switch Active		
Short description	Indicates that a limit switch is enabled and active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Limit Switch Active (10.066) is set to one when a limit switch is enabled and active.

Parameter	10.068 Hold Drive Healthy on Under Voltage		
Short description	Set to hold drive healthy if the drive is in the under voltage state		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Hold Drive Healthy on Under Voltage (10.068) can be used to hold the drive healthy active (*Drive Healthy* (10.001) = 1) and not flash the status LED on the front of the drive) when the drive is in the under voltage state (*Under Voltage Active* (10.016) = 1).

If *Hold Drive Healthy on Under Voltage* (10.068) = 0 and *Under Voltage Active* (10.016) = 1, then *Drive Healthy* (10.001) will be set to 0 and the status LED on the front of the drive will flash.

If *Hold Drive Healthy on Under Voltage* (10.068) = 1, *Under Voltage Active* (10.016) = 1 and the drive is not tripped (i.e. *Drive Status* (10.101) does not equal 9), then *Drive Healthy* (10.001) will be set to 1 and the status LED on the front of the drive will not flash.

If the drive is tripped then *Drive Healthy* (10.001) will be set to 0 and the status LED will flash independent of what *Hold Drive Healthy on Under Voltage* (10.068) is set to.

Parameter		10.069 Additional Status Bits	
Short description	Shows the additional status bits for the drive		
Mode	RFC-A		
Minimum	0 (Display: 00000000000)	Maximum	2047 (Display: 11111111111)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT		

The bits in *Additional Status Bits* (10.069) mirror the status bits parameters as shown below. Where the parameters do not exist in any mode the bit remains at zero.

Bit	Status parameter
0	Reserved
1	<i>Motor Overload Alarm</i> (10.017)
2	<i>Drive Over-temperature Alarm</i> (10.018)
3	<i>Drive Warning</i> (10.019)
4	Reserved
5	Reserved
6	<i>Remote Keypad Battery Low</i> (10.064)
7	<i>Auto-tune Active</i> (10.065)
8	<i>Limit Switch Active</i> (10.066)
9	Reserved
10	<i>Low AC Alarm</i> (10.107)
11	<i>Current Limit Active</i> (10.009)

Parameter		10.070 Trip 0 Sub-trip Number	
Short description	Shows the sub-trip number for trip 0		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter		10.071 Trip 1 Sub-trip Number	
Short description	Shows the sub-trip number for trip 1		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter		10.072 Trip 2 Sub-trip Number	
Short description	Shows the sub-trip number for trip 2		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.073 Trip 3 Sub-trip Number		
Short description	Shows the sub-trip number for trip 3		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.074 Trip 4 Sub-trip Number		
Short description	Shows the sub-trip number for trip 4		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.075 Trip 5 Sub-trip Number		
Short description	Shows the sub-trip number for trip 5		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.076 Trip 6 Sub-trip Number		
Short description	Shows the sub-trip number for trip 6		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.077 Trip 7 Sub-trip Number		
Short description	Shows the sub-trip number for trip 7		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.078 Trip 8 Sub-trip Number		
Short description	Shows the sub-trip number for trip 8		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.079 Trip 9 Sub-trip Number		
Short description	Shows the sub-trip number for trip 9		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

See *Trip 0* (10.020).

Parameter	10.080 Stop Motor		
Short description	Indicates that the motor is being stopped before the drive trips		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

It is possible for some trips to cause the motor to stop before the trip is initiated (see *Action On Trip Detection* (10.037)). During the period while the motor is being stopped before the trip is initiated *Stop Motor* (10.080) is set to one. Once the motor stops *Stop Motor* (10.080) is set back to zero.

Parameter	10.081 Phase Loss		
Short description	Indicates that the drive has detected an input phase loss		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

If phase loss or imbalance is detected that would initiate a phase loss trip with sub-trip 0, i.e. *Phase Loss.000*, then *Phase Loss* (10.081) is set to one. Either the motor will be stopped and the drive tripped or the drive will continue to operate normally until the user stops the motor and the drive trips (see *Action On Trip Detection* (10.037)). In either case *Phase Loss* (10.081) is set to one when the phase loss condition is detected and remains set until the drive trips.

Parameter	10.090 Drive Ready		
Short description	Indicates that the drive is ready and a run command is not active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Drive Ready (10.090) indicates that the drive is ready and a run command is not active.

Parameter	10.101 Drive Status		
Short description	Shows the present status of the drive		
Mode	RFC-A		
Minimum	0	Maximum	15
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

Value	Text
0	Inhibit
1	Ready
2	Stop
3	Scan
4	Run
5	Supply Loss
6	Deceleration
7	dc Injection
8	Reserved
9	Trip
10	Active
14	Heat
15	Under Voltage

Drive Status (10.101) shows the present status of the drive. The strings from this parameter are also used by the basic keypad to provide the status display text.

Premium only

The LED on the front of the drive gives an indication of the drive state as shown in the table below.

Drive state	Drive Healthy (10.001)	Drive Active (10.002)	Active Alarm (10.104)	Drive Warning (10.019)	LED
Healthy	1	0	0	0	Continuous
Tripped	0	X	X	X	Flashing: 0.5s on and 0.5s off
HF trip	0	X	X	X	Flashing: 0.25s on and 0.25s off
Standby	1	X	0	0	Flasing: 0.125s on and 0.125s off

X = Don't care

Parameter	10.102 Trip Reset Source		
Short description	Indicates whether a trip in the trip log has been reset		
Mode	RFC-A		
Minimum	0	Maximum	1023
Default		Units	
Type	16 Bit Power Down Save	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The bits in *Trip Reset Source* (10.102) correspond to each of the trips in the trip log (i.e. bit 0 corresponds to trip 0, bit 1 corresponds to trip 1, etc.). When a trip occurs, bit 0 is set to one and the other bits corresponding to the trips already in the trip log are shifted left one bit. If the trip is reset then bit 0 is set back to zero, otherwise if a higher priority trip occurs bit 0 is shifted left by one bit. The result is that each of the bits in *Trip Reset Source* (10.102) show whether trips in the trip log were reset or moved up the trip log by a higher priority trip.

Parameter	10.103 Trip Time Identifier		
Short description	Shows time in milliseconds since the drive powered up when a trip occurred		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default		Units	ms
Type	32 Bit Volatile	Update Rate	Write on trip
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

When a trip occurs the time in milliseconds since the drive powered up is stored in *Trip Time Identifier* (10.103). The time rolls-over when it reaches $2^{32} - 1$, but if the time is 0 a value of 1 is written. *Trip Time Identifier* (10.103) can be used to determine when a new trip has occurred as the value will change (unless there were exactly 2^{32} ms between trips) and will be non-zero.

Parameter	10.104 Active Alarm		
Short description	Shows the value of the active alarm		
Mode	RFC-A		
Minimum	0	Maximum	15
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

Value	Text	Description
0	None	No alarm
1	Brake Resistor	Braking overload
2	Motor Overload	Motor overload
3	Reserved	Inductor alarm (reserved)
4	Drive Overload	Drive overload
5	Auto Tune	Auto tune in progress
6	Limit Switch	Limit switch active
8	Reserved	Low load active
9	Option Slot 1	Slot 1 alarm
10	Reserved	Slot 2 alarm (Reserved)
11	Reserved	Slot 3 alarm (Reserved)
12	Reserved	Slot 4 alarm (Reserved)
13	Low AC	Low voltage mode
14	Current limit	Current limit active
15	24V Backup Lost	24V backup not present

If there is no alarm then *Active Alarm* (10.104) = 0. If one alarm is active then *Active Alarm* (10.104) shows the value of the alarm. If more than one alarm is active then *Active Alarm* (10.104) shows the active alarm with the lowest value. The strings from this parameter are also used by the basic keypad to provide the status display text except for option slot warnings where the option module may supply the string.

Parameter	10.106 Potential Drive Damage Conditions		
Short description	Indicates that the user has put the drive in a condition that could potentially damage the drive		
Mode	RFC-A		
Minimum	0 (Display: 00)	Maximum	3 (Display: 11)
Default	Units		
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Binary	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

The bits in *Potential Drive Damage Conditions* (10.106) are set under the conditions shown in the table below to indicate that the user has put the drive in a condition that could potentially damage the drive. The bits in this parameter cannot be cleared by users.

Potential Drive Damage Conditions (10.106)	Condition
0	Reserved
1	If <i>Cooling Fan control</i> (06.045) = 0 and the control board gets too hot, the drive trips <i>Oht Control</i> and the option module is put in standby.
2	Reserved
3	Reserved

Parameter	10.107 Low AC Alarm		
Short description	Indicates that the low AC alarm is active		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	Units		
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Low DC Link Operation* (06.077).

Parameter	10.108 Reversed cooling fan detected		
Short description	Indicates that the drive cooling fan may be fitted with the air being blown in the wrong direction		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	Units		
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, PT		

The *Reversed cooling fan detected* (10.108) detected flag is used to indicate that the pattern of IGBT temperatures shows that the cooling fan could be reversed. The fan is user replaceable so should be checked if this flag is set.

Menu 11 – Miscellaneous

Mode: RFC-A

Parameter	11.018 Status Mode Parameter 1		
Short description	Defines the parameter displayed on the upper row of the keypad when in status mode		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	2.001	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Status Mode Parameter 1 (11.018) and *Status Mode Parameter 2* (11.019) defines which parameters are displayed in Status mode.

If one of the two Status parameter does not exist or is 0.000, only one Status parameter is displayed.

If the two Status parameters do not exist or are 0.000, the active parameter is displayed.

Parameter	11.019 Status Mode Parameter 2		
Short description	Defines the parameter displayed on the lower row of the keypad when in status mode		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	4.020	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Status Mode Parameter 1* (11.018).

Parameter	11.020 Reset Serial Communications		
Short description	Set to one to update communications set-up		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC		

When *Serial Address* (11.023), *Serial Mode* (11.024), *Serial Baud Rate* (11.025), *Minimum Comms Transmit Delay* (11.026) or *Silent Period* (11.027) are modified the changes do not have an immediate effect on the serial communications system. The new values are used after the next power-up or if *Reset Serial Communications* (11.020) is set to one. *Reset Serial Communications* (11.020) is automatically cleared to zero after the communications system is updated.

Parameter	11.021 Customer defined scaling		
Short description	Defines the scaling of 11.018 in status view		
Mode	RFC-A		
Minimum	0.000	Maximum	10.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

Customer defined scaling (11.021) defines the scaling applied to *Status Mode Parameter 1* (11.018). The scaling is only applied in the Status mode.

Parameter	11.022 Active Parameter At Power-up		
Short description	Defines which parameter is displayed at power-up in view mode		
Mode	RFC-A		
Minimum	0.000	Maximum	0.080
Default	0.010	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Active Parameter At Power-up (11.022) defines which Menu 0 parameter is initially active at power-up in view mode.

See *Status Mode Parameter 1* (11.018).

Parameter	11.023 Serial Address		
Short description	Defines the serial address of the drive		
Mode	RFC-A		
Minimum	1	Maximum	247
Default	1	Units	
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

Serial Address (11.023) defines the node address for the serial comms interface in the range from 1 to 247.

Serial Address (11.023) to *Silent Period* (11.027) can be used to change the configuration of the drive 485 serial interface if present on the MFP adapter. The master should wait at least 20ms before sending a new message using the new protocol.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.024 Serial Mode		
Short description	Defines the serial mode of the drive		
Mode	RFC-A		
Minimum	0	Maximum	11
Default	0	Units	
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	8 2 NP
1	8 1 NP
2	8 1 EP
3	8 1 OP
4	8 2 NP M
5	8 1 NP M
6	8 1 EP M
7	8 1 OP M
8	7 1 EP
9	7 1 OP
10	7 1 EP M
11	7 1 OP M

The core drive always uses the Modbus rtu protocol and is always a slave. *Serial Mode* (11.024) defines the data format used by the serial comms interface. The bits in the value of *Serial Mode* (11.024) define the data format as follows. Bit 3 is always 0 in the core product as 8 data bits are required for Modbus rtu. The parameter value can be extended in derivative products which provide alternative communications protocols if required.

Bits	3	2	1 and 0
Format	Number of data bits 0 = 8 bits	Register mode 0 = Standard 1 = Modified	Stop bits and parity 0 = 2 stop bits, no parity 1 = 1 stop bit, no parity 2 = 1 stop bit, even parity 3 = 1 stop bit, odd parity

Bit 2 selects either standard or modified register mode. The menu and parameter numbers are derived for each mode as given in the table below. Standard mode is compatible with Commander SK. Modified mode is provided to allow register numbers up to 255 to be addressed. If any menus with numbers above 63 should contain more than 99 parameters, then these parameters cannot be accessed via Modbus rtu.

Register mode	Register address
Standard	(mm x 100) + ppp - 1 where mm ≤ 162 and ppp ≤ 99
Modified	(mm x 256) + ppp - 1 where mm ≤ 63 and ppp ≤ 255

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.025 Serial Baud Rate		
Short description	Defines the serial baud rate of the drive		
Mode	RFC-A		
Minimum	1	Maximum	10
Default	6	Units	Baud
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
1	600
2	1200
3	2400
4	4800
5	9600
6	19200
7	38400
8	57600
9	76800
10	115200

Serial Baud Rate (11.025) defines the baud rate used by the serial comms interface.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.026 <i>Minimum Comms Transmit Delay</i>		
Short description	Defines the minimum delay between the host and drive		
Mode	RFC-A		
Minimum	0	Maximum	250
Default	2	Units	ms
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

There will always be a finite delay between the end of a message from the host (master) and the time at which the host is ready to receive the response from the drive (slave). The drive does not respond until at least 1ms after the message has been received from the host allowing 1ms for the host to change from transmit to receive mode. This initial delay can be extended using *Minimum Comms Transmit Delay* (11.026) if required.

<i>Minimum Comms Transmit Delay</i> (11.026)	Action
0	The transmitters are turned on and data transmission begins immediately after the initial delay ($\geq 1\text{ms}$)
1	The transmitters are turned on after the initial delay ($\geq 1\text{ms}$) and data transmission begins 1ms later
2 or more	The transmitters are turned on after a delay of at least the time specified by <i>Minimum Comms Transmit Delay</i> (11.026) and data transmission begins 1ms later

The drive holds its own transmitters active for up to 1ms after it has transmitted data before switching to the receive mode; the host should not send any data during this time.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.027 <i>Silent Period</i>		
Short description	Defines the idle time required to detect the end of a received data message		
Mode	RFC-A		
Minimum	0	Maximum	250
Default	0	Units	ms
Type	8 Bit User Save	Update Rate	Read on serial communications reset
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

The silent period defines the idle time required to detect the end of a received data message. If *Silent Period* (11.027) = 0 then the silent period is at least 3.5 characters at the selected baud rate. This is the standard silent period for Modbus rtu. If *Silent Period* (11.027) is non-zero it defines the minimum silent period in milliseconds.

Changing the parameters does not immediately change the serial communications settings. See *Reset Serial Communications* (11.020) for more details.

Parameter	11.028 <i>Drive Derivative</i>		
Short description	Displays the drive derivative identifier		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

A drive can be made into a derivative drive by adding a derivative customisation image. The derivative software should specify a derivative identifier which is put into *Drive Derivative* (11.028) at power-up. Each derivative should have a unique identifier.

Parameter			
11.029 Software Version			
Short description	Displays the software version in the drive		
Mode	RFC-A		
Minimum	0	Maximum	99999999
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Version	Decimal Places	0
Coding	RO, ND, NC, PT		

Software Version (11.029) displays the drive software version number as a decimal number wwxxyy.

Parameter			
11.030 User Security Code			
Short description	Defines the user security code of the drive		
Mode	RFC-A		
Minimum	0	Maximum	9999
Default		Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, PT		

Defines the user security code of the drive.

Parameter			
11.031 User Drive Mode			
Short description	Defines the mode of the drive		
Mode	RFC-A		
Minimum	1	Maximum	2
Default		Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE, ND, NC, PT		

Value	Text
1	Open-loop
2	RFC-A

Select the drive mode on drive reset. The drive must be inactive (*Drive Active* (10.002) = 0) to take effect.

This parameter will change *Drive Mode* (11.084) to the active mode.

Parameter			
11.032 Maximum Heavy Duty Rating			
Short description	Displays the maximum heavy duty current rating of the drive		
Mode	RFC-A		
Minimum	0.00	Maximum	9999.99
Default		Units	A
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Maximum Heavy Duty Rating (11.032) defines the maximum setting for *Motor Rated Current* that gives heavy duty operation. If *Maximum Heavy Duty Rating* (11.032) = 0.00 then heavy duty operation is not possible. If *Maximum Heavy Duty Rating* (11.032) = VM_RATED_CURRENT[MAX] then normal duty operation is not possible.

Parameter			
11.033 Drive Rated Voltage			
Short description	Displays the voltage rating of the drive		
Mode	RFC-A		
Minimum	0	Maximum	4
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	110V
1	200V
2	400V
3	575V
4	690V

Drive Rated Voltage (11.033) shows the input voltage rating of the drive.

Parameter	11.034 Drive Configuration		
Short description	Defines the configuration of the drive		
Mode	RFC-A		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	Actioned on exit of edit mode and on drive reset
Display Format	Standard	Decimal Places	0
Coding	RW, TE, PT, BU		

Value	Text	Description
0	AV	Analog input 1 (voltage) Analog input 2 (voltage) selected by terminal (Local/Remote)
1	AI	Analog input 1 (current) or Analog input 2 (voltage) selected by terminal (Local/Remote)
2	AV Preset	Analog input 1 (voltage) or 3 presets selected by terminal
3	AI Preset	Analog input 1 (current) or 3 presets selected by terminal
4	Preset	Four presets selected by terminal
5	Keypad	Keypad reference
6	Keypad Ref	Keypad reference with terminal control
7	Electronic Pot	Electronic Potentiometer
8	Torque Control	Torque mode, Analog input 1 (current frequency reference) or Analog input 2 (voltage torque reference) selected by terminal
9	Pid Control	PID mode, Analog input 1 (current feedback source) and Analog input 2 (voltage reference source)

This parameter is used to automatically setup the user programmable area in the level 2 parameter set according to drive configurations. Other default values may also be changed by drive configuration. Parameters are stored in EEPROM automatically following a configuration change. Defaults are loaded before drive configuration changes are made. Defaults loaded are defined by *Defaults Previously Loaded* (11.046).

Action will only occur if the drive is inactive, not in UU state and no User Actions are running. Otherwise, the parameter will return to its pre altered value on exit from edit mode.

All parameters are saved if this parameter changes.

Parameter number	AV	AI	AV Preset	AI Preset	Preset	Keypad	Keypad Ref	Electronic Pot	Torque Control	Pid Control
Reference Selector (01.014)	0	0	1	1	3	4	6	3	0	1

Parameter	11.035 Power Software Version		
Short description	Displays the power processor firmware		
Mode	RFC-A		
Minimum	0	Maximum	99999999
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Version	Decimal Places	0
Coding	RO, ND, NC, PT		

Indicates the version of power processor software fitted.

Parameter	11.036 NV Media Card File Previously Loaded		
Short description	Displays the number of the last parameter file transferred from an NV Media Card to the drive		
Mode	RFC-A		
Minimum	0	Maximum	999
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, NC, PT		

NV Media Card File Previously Loaded (11.036) shows the number of the last parameter file transferred from an NV Media Card to the drive. If defaults are subsequently reloaded *NV Media Card File Previously Loaded* (11.036) is set to 0.

Parameter	11.037 NV Media Card File Number		
Short description	Selects a file by its file identification number		
Mode	RFC-A		
Minimum	0	Maximum	999
Default	0	Units	
Type	16 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

NV Media Card File Number (11.037) is used to select a file by its file identification number and can only be changed to values that correspond to files that are recognised by the drive on the NV media card or a value of 0. When *NV Media Card File Number* (11.037) corresponds to the number of a file the following data about the file is shown.

Parameter
<i>NV Media Card File Type</i> (11.038)
<i>NV Media Card File Version</i> (11.039)

The actions of erasing a card, erasing a file, creating a new file, changing a Menu 0 parameter or removing a card resets *NV Media Card File Number* (11.037) to 0.

Parameter	11.038 NV Media Card File Type		
Short description	Displays the file type of the file selected		
Mode	RFC-A		
Minimum	0	Maximum	5
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Open-loop
2	RFC-A
5	User Program

NV Media Card File Type (11.038) shows the file type of the file selected with *NV Media Card File Number* (11.037) as shown in the table below.

<i>NV Media Card File Type</i> (11.038)	File
0	No file selected
1	Open-loop mode parameter file
2	RFC-A mode parameter file
3	Reserved
4	Reserved
5	Onboard user program file

Parameter	11.039 NV Media Card File Version		
Short description	Displays the version number stored with the file selected		
Mode	RFC-A		
Minimum	0	Maximum	9999
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

NV Media Card File Version (11.039) shows the version number stored with the file selected with NV Media Card File Number (11.037).

Parameter	11.042 Parameter Cloning		
Short description	Defines the behaviour of cloning to an NV media card		
Mode	RFC-A		
Minimum	0	Maximum	4
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RW, TE, NC		

Value	Text
0	None
1	Read
2	Program
3	Auto
4	Boot

Parameter Cloning (11.042) can also be used to initiate data transfer to or from an NV media card as described below for each possible value of this parameter.

1: Read

Provided a parameter file with file identification number 1 exists on the NV media card then setting *Parameter Cloning* (11.042) = 1 and initiating a drive reset will transfer the parameter data to the drive (i.e. the same action as writing 6001 to Parameter mm.000 (mm.000)). When the action is complete *Parameter Cloning* (11.042) is automatically reset to zero.

2: Program

Setting *Parameter Cloning* (11.042) = 2 and initiating a drive reset will transfer the parameter data from the drive to a parameter file with file identification number 1. This is the same action as writing 4001 to Parameter mm.000 (mm.000) except that the file will be overwritten if it already exists. When the action is complete *Parameter Cloning* (11.042) is automatically reset to zero.

3: Auto

Setting *Parameter Cloning* (11.042) = 3 and initiating a drive reset will transfer the parameter data from the drive to a parameter file with file identification number 1. This is the same action as writing 4001 to Parameter mm.000 (mm.000) except that the file will be overwritten if it already exists. When the action is complete *Parameter Cloning* (11.042) remains at 3.

If the card is removed when *Parameter Cloning* (11.042) = 3, then *Parameter Cloning* (11.042) is set to 0, which forces the user to change *Parameter Cloning* (11.042) back to 3 if auto mode is still required. The user will need to set *Parameter Cloning* (11.042) = 3 and initiate a drive reset to write the complete parameter set to the new card.

When a parameter in Menu zero is changed via the keypad and *Parameter Cloning* (11.042) = 3 the parameter is saved both to the drive non-volatile memory and to the parameter file with identification number 1 on the card. Only the new value of the modified parameter, and not the value of all the other drive parameters, is stored each time. If *Parameter Cloning* (11.042) is not cleared automatically when a card is removed, then when a new card is inserted that contains a parameter file with identification number 1 the modified parameter would be written to the existing file on the new card and the rest of the parameters in this file may not be the same as those in the drive.

When *Parameter Cloning* (11.042) = 3 and the drive parameters are saved to non-volatile memory, the file on the card is also updated, therefore this file becomes a copy of the drive parameters. At power up, if *Parameter Cloning* (11.042) = 3, the drive will save its complete parameter set to the card. This is done to ensure that if a card is inserted whilst the drive is powered down the new card will have the correct data after the drive is powered up again.

4: Boot

When *Parameter Cloning* (11.042) = 4 the drive operates in the same way as with *Parameter Cloning* (11.042) = 3 and automatically creates a copy of it parameters on the NV Media card. The NC (not clonable) attribute for *Parameter Cloning* (11.042) is 1, and so it does not have a value stored in the parameter file on the card in the normal way. However, the value of *Parameter Cloning* (11.042) is held in the parameter file header. If *Parameter Cloning* (11.042) = 4 in the parameter file with a file identification value of 1 on an NV media card fitted to a drive at power-up then the following actions are taken:

1. The parameters from the parameter file with file identification number 1 are transferred to the drive and then saved in non-volatile memory.
2. If an onboard user program file with file identification number 2 exists then the onboard user program from this file is transferred to the drive.
3. *Parameter Cloning* (11.042) is set to 0 after the data transfer is complete.

It is possible to create a bootable parameter file by setting Parameter mm.000 (mm.000) = 2001 and initiating a drive reset. This file is created in one operation and is not updated when further parameter changes are made.

When the drive is powered up it detects which option modules are fitted before loading parameters from an NV media card which has been set up for boot mode. If a new option module has been fitted since the last time the drive was powered up, a *Slot1 Different* trip is initiated and then the parameters are transferred from the card. If the parameter file includes the parameters for the newly fitted option module then these are also transferred to the drive and the *Slot1 Different* trip is reset. If the parameter file does not include the parameters for the newly fitted option module then the drive does not reset the *Slot1 Different* trip. Once the transfer is complete the drive parameters are saved to non-volatile memory. The trip can be reset either by initiating a drive reset or by powering down and then powering up again.

Parameter	11.043 Load Defaults		
Short description	Defines which defaults are to be loaded into the drive		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit Volatile	Update Rate	Exit from edit of menus 0 or a drive reset.
Display Format	Standard	Decimal Places	0
Coding	RW, TE, NC		

Value	Text
0	None
1	Standard
2	US

If *Load Defaults* (11.043) is non-zero and a drive reset (or exit from edit on menu 0) is initiated then the drive will load and save default parameters. If *Load Defaults* (11.043) = 1 then standard defaults are loaded and if *Load Defaults* (11.043) = 2 then US defaults are loaded. This parameter has priority over actions defined by *Parameter mm.000* (mm.000) and *Parameter Cloning* (11.042). If *Load Defaults* (11.043) is used to initiate loading defaults then it is cleared along with *Parameter mm.00* and *Parameter Cloning* (11.042) when the action is completed.

Parameter	11.044 User Security Status		
Short description	Defines the security level within the drive		
Mode	RFC-A		
Minimum	0	Maximum	5
Default		Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE, ND, PT		

Value	Text
0	Menu 0
1	All Menus
2	Read-only Menu 0
3	Read-only
4	Status Only
5	No Access

Parameter	11.045 Select Motor 2 Parameters		
Short description	Set to 1 to select motor 2 parameters		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Motor 1
1	Motor 2

Select Motor 2 Parameters (11.045) is used to select the motor map 2 parameters from Menu 21 to be substituted for the standard motor parameters. If *Select Motor 2 Parameters* (11.045) is modified when *Drive Active* (10.002) = 1 the change only becomes effective when *Drive Active* (10.002) = 0. When *Select Motor 2 Parameters* (11.045) = 1 the results from auto-tuning are written to the motor map 2 parameters in Menu 21 instead of to the standard parameters. Each time *Select Motor 2 Parameters* (11.045) is changed *Motor Protection Accumulator* (04.019) is reset to zero. *Motor 2 Active* (21.015) shows the motor map that is active.

Parameter	11.046 Defaults Previously Loaded		
Short description	Displays the defaults previously loaded in the drive		
Mode	RFC-A		
Minimum	0	Maximum	2000
Default		Units	
Type	16 Bit User Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Defaults Previously Loaded (11.046) shows the value used to load the previously loaded defaults (i.e. 1233 for standard defaults, or 1244 for US defaults).

Parameter	11.047 Onboard User Program: Enable		
Short description	Enables the onboard user program		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Stop
1	Run

Onboard user programming provides a background task that loops continuously and a timed task that is executed each time at a defined rate.

Onboard User Program: Enable (11.047) allows the onboard user program to be stopped or run.

0: Stop

The onboard user program is stopped. If it is restarted by setting *Onboard User Program: Enable* (11.047) to a non-zero value the background task starts from the beginning.

1: Run

The onboard user program will run.

Parameter	11.048 Onboard User Program: Status		
Short description	Displays the status of the onboard user program		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Onboard User Program: Status (11.048) shows the status of the onboard user program. This is a value written to this parameter from the user program itself.

0: Stopped

Indicates that a valid user program is present, but not currently running.

1: Running

Indicates that a valid user program is present and running.

3: Not present

Indicates that no user program is present.

Parameter	11.049 Onboard User Program: Programming Events		
Short description	Displays the number of programming events of the onboard user program		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Onboard User Program: Programming Events (11.049) = 0 when the drive is manufactured and is incremented each time an onboard user program image is written to the drive. If an onboard user program image is written more than 65535 times *Onboard User Program: Programming Events* (11.049) = 65535. *Onboard User Program: Programming Events* (11.049) shows how many times the flash memory within the drive has been reprogrammed.

Parameter	11.050 Onboard User Program: FreewheelingTasks Per Second		
Short description	Displays the rate of freewheeling tasks of the onboard user program		
Mode	RFC-A		
Minimum	0	Maximum	65535
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

During each scan in a background task it is possible to give an indication to the drive that the scan loop is starting. If this indication is given then *Onboard User Program: FreewheelingTasks Per Second* (11.050) will give the number of times this indication is given per second.

Parameter	11.051 Onboard User Program: Clock Task Time Used		
Short description	Displays the percentage of the available time used by the onboard user program clock task		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default		Units	%
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	1
Coding	RO, ND, NC, PT		

Onboard User Program: Clock Task Time Used (11.051) shows the percentage of the available time used by the onboard user program timed task.

Parameter	11.052 Serial Number LS		
Short description	Shows the least significant 9 decimal digits of the drive serial number		
Mode	RFC-A		
Minimum	0 (Display: 000000)	Maximum	999999 (Display: 999999)
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Lead Zero Pad	Decimal Places	0
Coding	RO, ND, NC, PT		

The drive serial number is available as a pair of 32 bit values where *Serial Number LS* (11.052) provides the least significant 6 decimal digits and *Serial Number MS* (11.053) provides the most significant 4 decimal digits. The reconstructed serial number is ((*Serial Number MS* (11.053) x 1000000) + *Serial Number LS* (11.052)).

Example 1

Serial number "1234567890" would be stored as 11.053 = 1234, 11.052 = 567890.

Example 2

Serial number "1234000056" would be stored as 11.053 = 1234, 11.052 = 56. *Serial Number LS* (11.052) will be shown on the keypad as 000056 (i.e. including the leading zeros).

Parameter	11.053 Serial Number MS		
Short description	Shows the most significant 9 decimal digits of the drive serial number		
Mode	RFC-A		
Minimum	0	Maximum	999999
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Serial Number LS* (11.052).

Parameter	11.054 Drive Date Code		
Short description	Shows the drive date code		
Mode	RFC-A		
Minimum	0 (Display: 0000)	Maximum	9999 (Display: 9999)
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Lead Zero Pad	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Drive Date Code (11.054) is a four-digit number in the form yyww where yy is the year and ww is the week.

Parameter	11.055 Onboard User Program: Clock Task Schedule Rate		
Short description	Displays the interval at which the clock task is scheduled in ms		
Mode	RFC-A		
Minimum	0	Maximum	262128
Default		Units	ms
Type	32 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

Onboard User Program: Clock Task Schedule Rate (11.055) shows the rate at which the timed task is scheduled in ms.

Parameter	11.060 Maximum Rated Current		
Short description	Displays the maximum rated current or normal duty rating of the drive		
Mode	RFC-A		
Minimum	0.000	Maximum	999.999
Default		Units	A
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	3
Coding	RO, ND, NC, PT		

Maximum Rated Current (11.060) defines the variable maximum VM_RATED_CURRENT[MAX] which defines the maximum *Motor Rated Current* (05.007). Therefore Maximum *Maximum Rated Current* (11.060) is the maximum rated current for normal duty operation (if normal duty operation is allowed).

Parameter	11.061 Full Scale Current Kc		
Short description	Displays the full scale current Kc		
Mode	RFC-A		
Minimum	0.000	Maximum	999.999
Default		Units	A
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	3
Coding	RO, ND, NC, PT		

Full Scale Current Kc (11.061) shows the full scale current in r.m.s. Amps. If the drive current exceeds this level it will cause an over-current trip.

Parameter	11.063 Product Type		
Short description	Displays the core product type		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Product Type (11.063) shows the core product type as given in the table below. The drive could be the basic product or a derivative of the basic product as defined by *Drive Derivative* (11.028).

Product Type (11.063)	Core product range
0	Unidrive M600 to M800
1	Unidrive M100 to M400

Parameter	11.064 Product Identifier Characters		
Short description	Displays the product identifier characters		
Mode	RFC-A		
Minimum	1295265840	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

The drive model and rating can be identified as AAAAnnnpppppBBBBCCCCDDDD where each section of the model identifier is taken from a parameter. 'AAAA', 'BBBB', 'CCCC' and 'DDDD' is alpha-numeric characters. 'nnn' and 'ppppp' are decimal digits.

The drive model and rating can be identified as AAAA B nnnppppp CCCC DD EE FFF where each section of the model identifier is taken from a parameter. AAAA, B, CCCC, DDDD, EE and FFF are alpha-numeric characters. nnn and ppppp are decimal digits.

Section of identifier	Parameter
AAAA	<i>Product Identifier Characters</i> (11.064)
nnn	<i>Frame size and voltage code</i> (11.065)
ppppp	<i>Drive current rating</i> (11.068)
CCCC	<i>Additional Identifier Characters 1</i> (11.091)
DDEE	<i>Additional Identifier Characters 2</i> (11.092)
FFFB	<i>Additional Identifier Characters 3</i> (11.093)

Product Identifier Characters (11.064) as defined in the table below.

Digits	Meaning
3 to 0	Product identifier (i.e. M100, M201)

Frame size and voltage code (11.065) is split into two fields as defined in the table below.

Digits	Meaning
2 to 1	Frame size determined by Derivative or required current.
0	Voltage code (1 = 110V, 2 = 230V, 4 = 400V, 5 = 575V, 6 = 690V)

Drive current rating (11.068) is as defined in the table below.

Digits	Meaning
4 to 0	Drive current rating (i.e. 00133 = 13.3A)

Example

The model number M101-04200133 A101 00 AB100 would be displayed in parameters as follows

Parameter	Value
Product Identifier Characters (11.064)	M101
Frame size and voltage code (11.065)	042
Drive current rating (11.068)	00133
Additional Identifier Characters 1 (11.091)	A101
Additional Identifier Characters 2 (11.092)	00AB
Additional Identifier Characters 3 (11.093)	100-

Parameter	11.065 Frame size and voltage code		
Short description	Displays the frame size and voltage code		
Mode	RFC-A		
Minimum	0 (Display: 000)	Maximum	999 (Display: 999)
Default		Units	
Type	16 Bit Volatile	Update Rate	Power-up write
Display Format	Lead Zero Pad	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.066 Power Stage Identifier		
Short description	Displays the power stage identifiers within the drive		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Power Stage Identifier (11.066) is used to show power stages that require changes to the drive user parameters (i.e. visibility, range or defaults). It is anticipated that all power stages will require the same parameter structure, and so *Power Stage Identifier* (11.066) will always be equal to zero. It should be noted that this parameter does not identify the rating of the power stage.

Power Stage Identifier (11.066)	Power stage
0	Standard M600-M800
1	Standard M100-M400

Parameter	11.067 Control Board Identifier		
Short description	Displays the control board identifiers within the drive		
Mode	RFC-A		
Minimum	0	Maximum	255
Default		Units	
Type	8 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT, BU		

Control Board Identifier (11.067) identifies the main control board hardware as given in the table below.

Control Board Identifier (11.067)	Control board
0	Reserved
1	Reserved
2	M100
3	Reserved
4	Reserved
5	M101
6	Reserved
7	Reserved
8	M200
9	Reserved
10	Reserved
11	M201
12	Reserved
13	Reserved
14	M300
15	Reserved
16	Reserved
17	M400
18	Reserved

Parameter	11.068 Drive current rating		
Short description	Drive current rating in 0.1 of Amps		
Mode	RFC-A		
Minimum	0 (Display: 00000)	Maximum	32767 (Display: 32767)
Default		Units	
Type	16 Bit Volatile	Update Rate	Power-up write
Display Format	Lead Zero Pad	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.070 Core Parameter Database Version		
Short description	Displays the core parameter database version within the drive		
Mode	RFC-A		
Minimum	0.00	Maximum	99.99
Default		Units	
Type	16 Bit Volatile	Update Rate	Power-up write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Core Parameter Database Version (11.070) gives the version number of the parameter database used to define the core parameter menus in the drive (Menu 1 to 14 and 21 to 23) in 2 digit BCD format. All other menus are customisable and if these menus are changed their default values are automatically loaded. However, if the drive software is changed it may be necessary to load defaults for all menus, although this will only be required rarely. Defaults for all menus are loaded when the most significant digit of *Core Parameter Database Version* (11.070) changes. Therefore if the drive firmware is modified and the most significant digit of the core database version has changed an *EEPROM Fail.001* trip is initiated and default parameters are loaded.

Parameter	11.072 NV Media Card Create Special File		
Short description	Defines if a parameter file is created as a macro file during transfer		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, NC		

If *NV Media Card Create Special File* (11.072) = 1 when a parameter file is transferred to an NV media card the file is created as a macro file. *NV Media Card Create Special File* (11.072) is reset to 0 after the file is created or the transfer fails.

Parameter	11.073 NV Card Type Fitted		
Short description	Displays the type of the currently fitted NV media card		
Mode	RFC-A		
Minimum	0	Maximum	2
Default		Units	
Type	8 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Reserved
2	SD Card

NV Card Type Fitted (11.073) shows the type of non-volatile media card inserted in the drive.

Parameter	11.075 NV Media Card Read-only Flag		
Short description	Displays the state of the read-only flag for the currently fitted card		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

NV Media Card Read-only Flag (11.075) shows the state of the read-only flag for the currently fitted card.

Parameter	11.076 NV Media Card Warning Suppression Flag		
Short description	Displays the state of the warning flag for the currently fitted card		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

NV Media Card Warning Suppression Flag (11.076) shows the state of the warning flag for the currently fitted card.

Parameter	11.077 NV Media Card File Required Version		
Short description	Displays the version number for a file when it is created on an NV media card		
Mode	RFC-A		
Minimum	0	Maximum	9999
Default		Units	
Type	16 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RW, ND, NC, PT		

The value of NV Media Card File Required Version (11.077) is used as the version number for a file when it is created on an NV media card. NV Media Card File Required Version (11.077) is reset to 0 when the file is created or the transfer fails.

Parameter	11.079 Drive Name Characters 1-4		
Short description	Defines characters 1-4 of a string which can be used to identify the drive		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default	757935405	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

Drive Name Characters 1-4 (11.079) to Drive Name Characters 13-16 (11.082) can be used to store a 16 character string which can be used to identify the drive. The string is arranged as shown below.

1	4	5	8	9	12	13	16
Pr 11.079		Pr 11.080		Pr 11.082		Pr 11.083	

This uses the standard ASCII character set.

If *Status Mode Parameter 1* (11.018) or *Status Mode Parameter 2* (11.019) are set to 11.079 then the drive name is fully displayed in status view using *Drive Name Characters 1-4* (11.079) to *Drive Name Characters 13-16* (11.082). Note that only 15 characters can be displayed on M400 and only 6 characters on M100-M300.

Parameter	11.080 Drive Name Characters 5-8		
Short description	Defines characters 5-8 of a string which can be used to identify the drive		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default	757935405	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

See *Drive Name Characters 1-4* (11.079).

Parameter	11.081 Drive Name Characters 9-12		
Short description	Defines characters 9-12 of a string which can be used to identify the drive		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default	757935405	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

See *Drive Name Characters 1-4* (11.079).

Parameter	11.082 Drive Name Characters 13-16		
Short description	Defines characters 13-16 of a string which can be used to identify the drive		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default	757935405	Units	
Type	32 Bit User Save	Update Rate	N/A
Display Format	String	Decimal Places	0
Coding	RW, PT		

See *Drive Name Characters 1-4* (11.079).

Parameter	11.084 Drive Mode		
Short description	Defines and displays the current drive mode		
Mode	RFC-A		
Minimum	1	Maximum	2
Default		Units	
Type	8 Bit User Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
1	Open-loop
2	RFC-A

Drive Mode (11.084) is used to hold the currently active drive mode.

Parameter	11.085 Security Status		
Short description	Displays the security status within the drive		
Mode	RFC-A		
Minimum	0	Maximum	3
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	None
1	Read-only
2	Status-only
3	No Access

Security Status (11.085) shows the security that will apply when security is enabled by setting a non-zero value for User Security Code (11.030).

Parameter	11.086 Menu Access Status		
Short description	Displays the amount of access of the menus within the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	8 Bit Power Down Save	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT		

Value	Text
0	Menu 0
1	All Menus

If *Menu Access Status* (11.086) = 0 then only Menu 0 can be accessed with a keypad. If *Menu Access Status* (11.086) = 1 then all menus can be accessed with a keypad.

Parameter	11.090 Keypad Port Serial Address		
Short description	Defines the node address for the keypad port serial comms interface		
Mode	RFC-A		
Minimum	1	Maximum	16
Default	1	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

Keypad Port Serial Address (11.090) defines the node address for the keypad port serial comms interface. Normally the default value of 1 is used, but this can be changed if required. The keypad attached to the port will sense the address automatically.

Parameter	11.091 Additional Identifier Characters 1		
Short description	Displays the additional identifier characters		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.092 Additional Identifier Characters 2		
Short description	Displays the additional identifier characters		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.093 Additional Identifier Characters 3		
Short description	Displays the additional identifier characters		
Mode	RFC-A		
Minimum	-2147483648	Maximum	2147483647
Default		Units	
Type	32 Bit Volatile	Update Rate	Power-up write
Display Format	String	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Product Identifier Characters* (11.064).

Parameter	11.097 AI ID Code		
Short description	Indicates the AI module type fitted in the AI slot		
Mode	RFC-A		
Minimum	0	Maximum	4
Default		Units	
Type	8 Bit Volatile	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RO, TE, ND, NC, PT, BU		

Value	Text
0	None
1	SD Card
2	RS-485
3	boot
4	RS-485

AI ID Code (11.097) indicates the Adaptor Interface module type fitted in the AI slot.

Parameter	11.098 24V Alarm Loss Enable		
Short description	Indicate if the 24V alarm loss is enabled		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	background
Display Format	Standard	Decimal Places	0
Coding	RW		

24V Alarm Loss Enable (11.098) enable the 24V alarm loss. If 24V Supply Input State (08.043) = 0 and 24V Alarm Loss Enable (11.098) = 1 then the 24V is active.

Parameter	11.099 Modbus Parameter Conversion		
Short description	Convert read/write parameter via Modbus serial comm.		
Mode	RFC-A		
Minimum	0 (Display: 0000)	Maximum	15 (Display: 1111)
Default	0 (Display: 0000)	Units	
Type	16 Bit User Save	Update Rate	
Display Format	Binary	Decimal Places	0
Coding	RW		

If Modbus Parameter Conversion (11.099) bits are turned on then the following parameters are converted when read or written by modbus serial comm.

This is NOT a full comms compatibility to previous drive generations. Only the following parameters are converted.

Modbus Parameter Conversion (11.099) bits	Effect
0	Frequency parameters: 1.001,1.002,1.003,1.004,1.005,1.006,1.007,1.017,1.021,1.022, 1.023,1.024,1.025,1.026,1.027,1.028,1.029,1.030,1.031,1.032, 1.033,1.034,1.036,1.037,1.038,2.001,3.005,3.006,3.022,3.043, 3.045,5.001,5.006,12.044,12.045,21.001,21.002,21.006 scaled by 10.
1	Source/Destination parameters: 7.010,7.014,7.019,8.021,8.022,8.023,8.024,8.025,8.028,9.004,9.006, 9.010,9.014,9.016,9.020,9.025,9.033,12.003,12.007,12.008,12.009, 12.011,12.023,12.027,12.028,12.029,12.031,14.002,14.003,14.004,14.009,14.016. Parameter number is converted from 3 to 2 digits (i.e. #1.01 is #1.001)
2	Percentage parameters: 7.001,7.002,7.030,7.031,9.003,12.004,12.005,12.012,12.024,12.025, 12.032,14.001,14.013,14.014,14.019,14.020,14.021,14.022 scaled by 10
3	Motor parameters: 5.008,5.017,5.024,21.008,21.012,21.014 scaled by 10

Examples:

bit 0:

01.021 = 1.23Hz and Modbus Parameter Conversion (11.099) = 1 then value read is 12 equivalent of 1.20Hz

01.021 = 1.23Hz and Modbus Parameter Conversion (11.099) = 0 then value read is 123 equivalent of 1.23Hz

Value 123 is written to 01.021 and Modbus Parameter Conversion (11.099) = 1 then 01.021 = 12.30Hz

Value 123 is written to 01.021 and *Modbus Parameter Conversion* (11.099) = 0 then 01.021 = 1.23Hz

Menu 12 Single Line Descriptions – User Functions 2 and Brake Control

Mode: RFC-A

Parameter		Range	Default	Type

Menu 12 – User Functions 2 and Brake Control

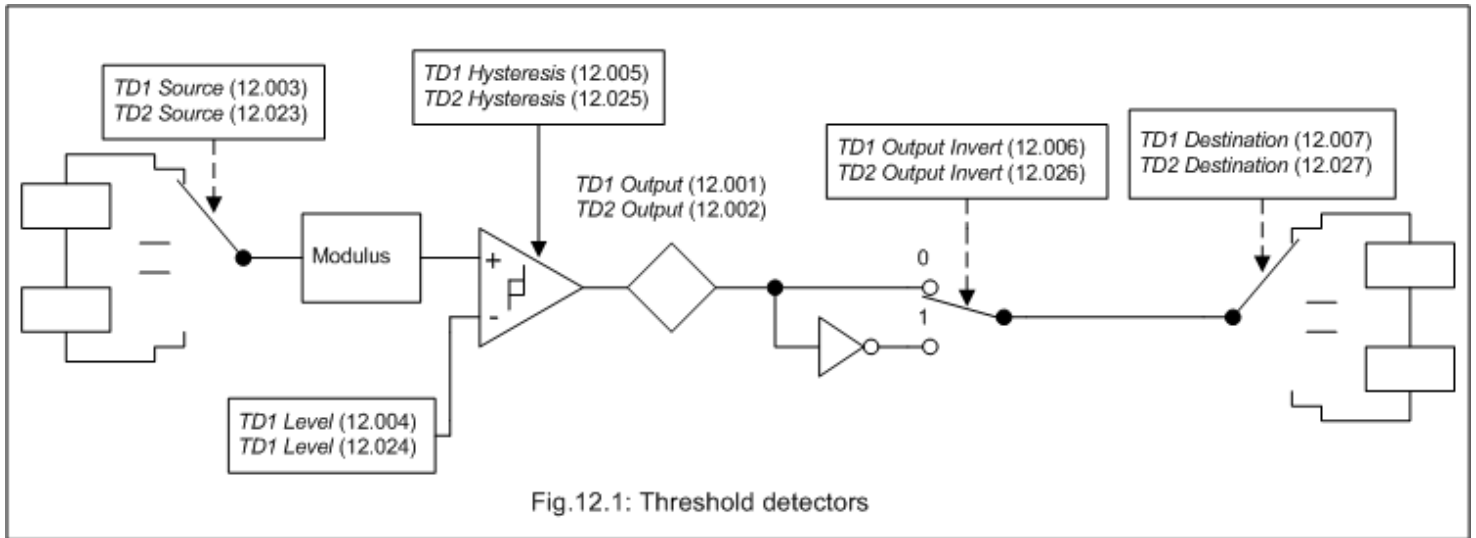

Mode: RFC-A

Menu 12 provides parameters for the following features:

1. Threshold detectors
2. Variable selectors
3. Mechanical brake controller

Parameter	12.001 <i>Threshold Detector 1 Output</i>		
Short description	Displays the output of threshold detector 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

The threshold detector functions are always active even if the source and destination are not routed to valid parameters. If the source is not a valid parameter then the source value is taken as 0. The update rate for each of the threshold detector functions is always 4ms.

The following description is for threshold detector 1, but threshold detector 2 operates in the same way. The level of the parameter defined by *Threshold Detector 1 Source* (12.003) is converted to a percentage and compared to *Threshold Detector 1 Level* (12.004) with hysteresis to give *Threshold Detector 1 Output* (12.001) as follows:

Source	<i>Threshold Detector 1 Output</i> (12.001)
Source	0
Lower threshold ≤ Source	No change of state
Source ≥ Upper threshold	1

$$\text{Lower threshold} = \text{Threshold Detector 1 Level (12.004)} - (\text{Threshold Detector 1 Hysteresis (12.005)} / 2)$$

$$\text{Upper threshold} = \text{Threshold Detector 1 Level (12.004)} + (\text{Threshold Detector 1 Hysteresis (12.005)} / 2)$$

The output value can then be inverted with *Threshold Detector 1 Output Invert* (12.006) before being routed to the destination defined by *Threshold Detector 1 Destination* (12.007).

Parameter	12.002 <i>Threshold Detector 2 Output</i>		
Short description	Displays the output of threshold detector 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.003 Threshold Detector 1 Source		
Short description	Defines the source parameter for threshold detector 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.004 Threshold Detector 1 Level		
Short description	Defines the reference level for threshold detector 1		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.005 Threshold Detector 1 Hysteresis		
Short description	Defines the hysteresis for threshold detector		
Mode	RFC-A		
Minimum	0.00	Maximum	25.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.006 Threshold Detector 1 Output Invert		
Short description	Set to 1 to invert the output of threshold detector 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.007 Threshold Detector 1 Destination		
Short description	Defines the destination parameter for threshold detector 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.008 Variable Selector 1 Source 1		
Short description	Defines the 1st source parameter for variable selector 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

The variable selector functions are always active even if the source and destination are not routed to valid parameters. If a source is not a valid parameter then the source value is taken as 0. The update rate for each of the variable selector functions is always 4ms.

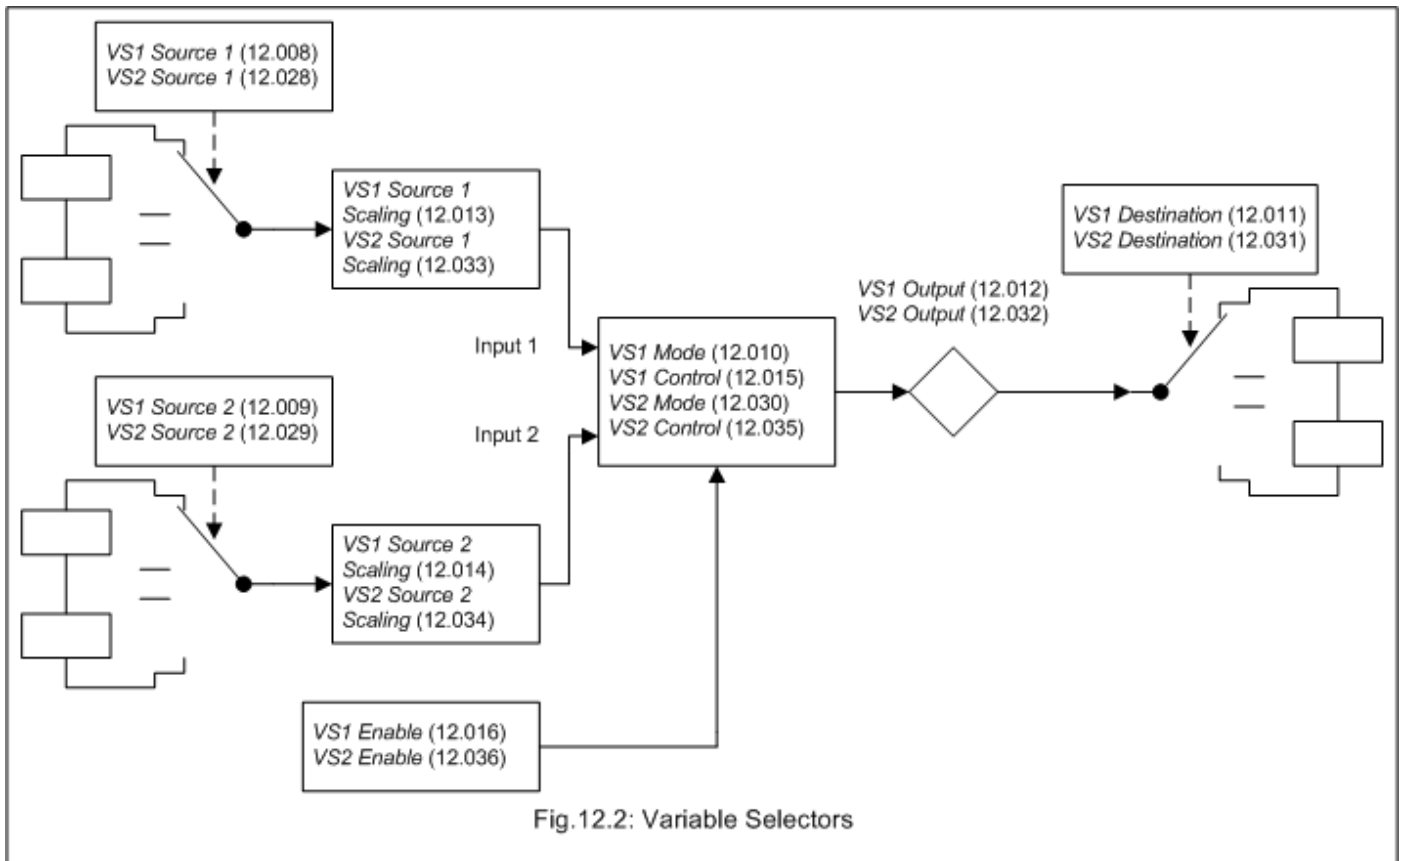

Fig.12.2: Variable Selectors

The following description is for variable selector 1, but variable selector 2 operates in the same way. The source parameters selected with *Variable Selector 1 Source 1* (12.008) and *Variable Selector 1 Source 2* (12.009) are converted to a percentage value, scaled with *Variable Selector 1 Source 1 Scaling* (12.013) and *Variable Selector 1 Source 2 Scaling* (12.014) respectively and then combined with a function defined by *Variable Selector 1 Mode* (12.010) to give *Variable Selector 1 Output* (12.012) as a percentage value. If *Variable Selector 1 Enable* (12.016) = 1 then the function operates normally. If *Variable Selector 1 Enable* (12.016) = 0 then *Variable Selector 1 Output* (12.012) = 0.00% and any states within the function are reset (i.e. the time constant function accumulator is held at zero). If the value of *Variable Selector 1 Mode* (12.010) is changed then all internal function state are also reset.

The table below shows the functions that can be selected with *Variable Selector 1 Mode* (12.010).

Variable Selector 1 Mode (12.010)	Variable Selector 1 Output (12.012)
0: Input 1	Input 1
1: Input 2	Input 2
2: Add	Input 1 + Input 2
3: Subtract	Input 1 - Input 2
4: Multiply	(Input 1 x Input 2) x 100.00%
5: Divide	(Input 1 x 100.00%) / Input 2
6: Time Const	Input 1 / (1 + τs) where τ <i>Variable Selector 1 Control</i> (12.015) seconds
7: Ramp	Input 1 as an input to a linear ramp function where the time to ramp 0.00% to 100.00% is defined by <i>Variable Selector 1 Control</i> (12.015)
8: Modulus	Input 1
9: Powers	If <i>Variable Selector 1 Control</i> (12.015) = 0.02 then Input ² / 100.00% Else if <i>Variable Selector 1 Control</i> (12.015) = 0.03 then Input ³ / 100.00% Else Input 1

Parameter	12.009 <i>Variable Selector 1 Source 2</i>		
Short description	Defines the 2nd source parameter for variable selector 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.010 Variable Selector 1 Mode		
Short description	Defines the mode for variable selector		
Mode	RFC-A		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Input 1
1	Input 2
2	Add
3	Subtract
4	Multiply
5	Divide
6	Time Const
7	Ramp
8	Modulus
9	Powers

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.011 Variable Selector 1 Destination		
Short description	Defines the destination parameter for variable selector 1		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.012 Variable Selector 1 Output		
Short description	Displays the output of variable selector 1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.013 Variable Selector 1 Source 1 Scaling		
Short description	Defines the scaling for the 1st input for variable selector 1		
Mode	RFC-A		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.014 Variable Selector 1 Source 2 Scaling		
Short description	Defines the scaling for the 2nd input for variable selector 1		
Mode	RFC-A		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.015 Variable Selector 1 Control		
Short description	Defines the control for variable selector 1		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.016 Variable Selector 1 Enable		
Short description	Enables variable selector 1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Variable Selector 1 Source 1* (12.008) for more details. *Variable Selector 1 Enable* (12.016) and *Variable Selector 2 Enable* (12.036) have a default of 1 so that if these parameters are not used the variable selectors will still function.

Parameter	12.023 Threshold Detector 2 Source		
Short description	Defines the source parameter for threshold detector 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.024 Threshold Detector 2 Level		
Short description	Defines the reference level for threshold detector 2		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.025 Threshold Detector 2 Hysteresis		
Short description	Defines the hysteresis for threshold detector 2		
Mode	RFC-A		
Minimum	0.00	Maximum	25.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.026 Threshold Detector 2 Output Invert		
Short description	Set to 1 to invert the output of threshold detector 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.027 Threshold Detector 2 Destination		
Short description	Defines the destination parameter for threshold detector 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Threshold Detector 1 Output* (12.001).

Parameter	12.028 Variable Selector 2 Source 1		
Short description	Defines the 1st source parameter for variable selector 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.029 Variable Selector 2 Source 2		
Short description	Defines the 2nd source parameter for variable selector 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.030 Variable Selector 2 Mode		
Short description	Defines the mode for variable selector 2		
Mode	RFC-A		
Minimum	0	Maximum	9
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Input 1
1	Input 2
2	Add
3	Subtract
4	Multiply
5	Divide
6	Time Const
7	Ramp
8	Modulus
9	Powers

See *Variable Selector 1 Source 1* (12.008).

Parameter	12.031 Variable Selector 2 Destination		
Short description	Defines the destination parameter for variable selector 2		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter			
12.032 Variable Selector 2 Output			
Short description	Displays the output of variable selector 2		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *Variable Selector 1 Source 1* (12.008).

Parameter			
12.033 Variable Selector 2 Source 1 Scaling			
Short description	Defines the scaling for the 1st input for variable selector 2		
Mode	RFC-A		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter			
12.034 Variable Selector 2 Source 2 Scaling			
Short description	Defines the scaling for the 2nd input for variable selector 2		
Mode	RFC-A		
Minimum	-4.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *Variable Selector 1 Source 1* (12.008).

Parameter			
12.035 Variable Selector 2 Control			
Short description	Defines the control for variable selector 2		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	0.00	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter			
12.036 Variable Selector 2 Enable			
Short description	Enables variable selector 2		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	1	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *Variable Selector 1 Source 1* (12.008).

Parameter			
12.040 BC Brake Release			
Short description	Indicates that the brake controller has released the mechanical brake		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

The functions of *BC Brake Release* (12.040) and *BC Enable* (12.041) are the same in all drive modes and are described below. The functions of other brake controller parameters vary between drive modes, and these are described in separate sections.

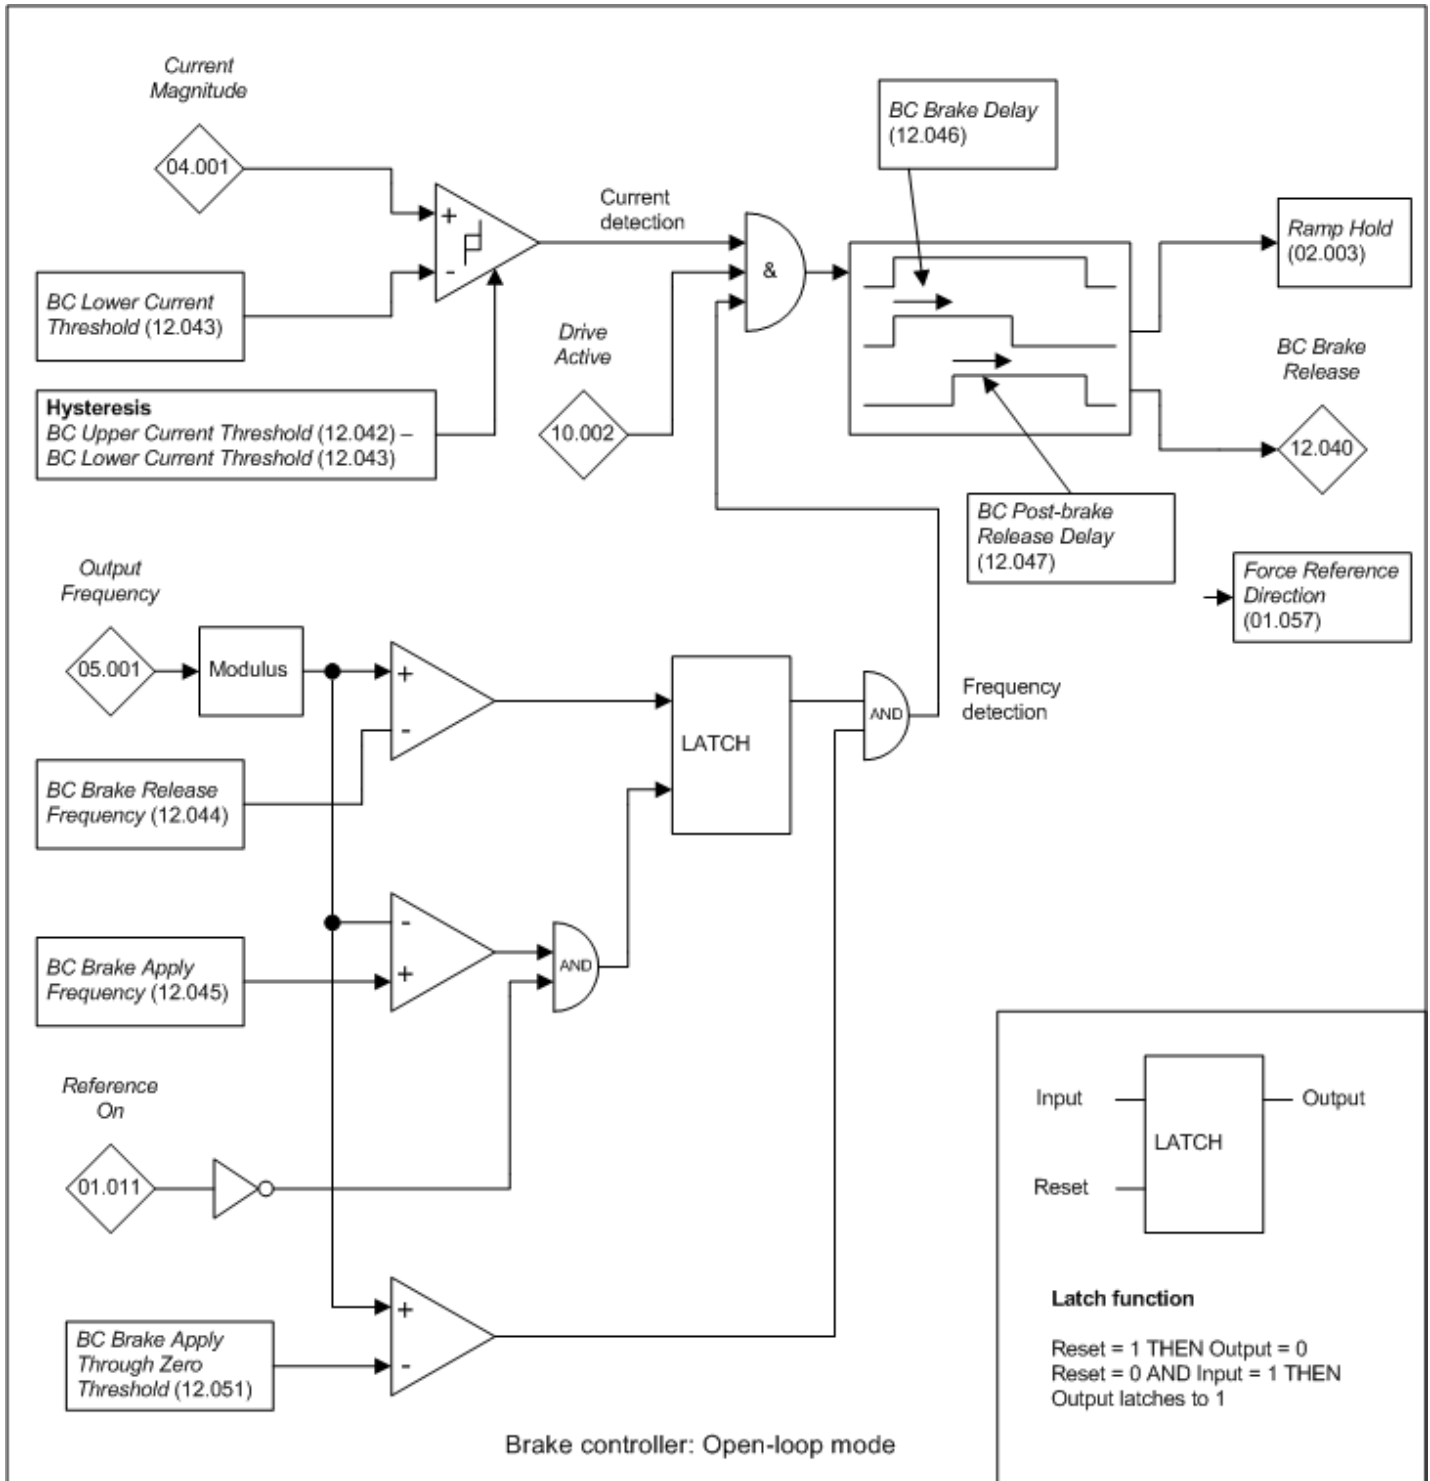

The mechanical brake control function can be used to control an electro-mechanical brake via digital I/O.

BC Brake Release (12.040) = 0 when the brake should be applied and 1 when the brake should be released. Normally this should be routed to a digital output to control the mechanical brake.

If *BC Enable* (12.041) = 0 then the brake controller is disabled. The following parameters which are used by the brake controller to operate the drive are reset to 0 on the transition of *BC Enable* (12.041) from 1 to 0.

Parameter
<i>Force Reference Direction</i> (01.057)
<i>Ramp Hold</i> (02.003)

Open loop mode

Current detection

The *Current Magnitude* (04.001) is compared to an upper and lower threshold by a comparator with hysteresis to give torque present and drive output open detection functions respectively. *BC Lower Current Threshold* (12.043) and *BC Upper Current Threshold* (12.042) are given as a percentage of *Motor Rated Current* (05.007). *BC Upper Current Threshold* (12.042) should be set to the current level that indicates that there is magnetising current and sufficient torque producing current in the motor to deliver the required amount of torque when the brake is released. The output of the comparator remains active after this level has been reached unless the current has subsequently fallen below *BC Lower Current Threshold* (12.043) which should be set to the required level to detect the condition where the motor has been disconnected from the drive. If *BC Lower Current Threshold* (12.043) \geq *BC Upper Current Threshold* (12.042) then the upper threshold applies with a hysteresis band of 0. If *BC Lower Current Threshold* (12.043) = *BC Upper Current Threshold* (12.042) = 0 then the output of the comparator is always one.

Frequency detection

The frequency comparator is used on starting, to detect when the motor frequency has reached a level where the motor can produce the required amount of torque to ensure that the motor rotates in the demanded direction when the brake is released. *BC Brake Release Frequency* (12.044) should be set to

a level slightly above the motor slip frequency that is likely to occur under the highest expected load that is applied to the motor when the brake is released.

The brake apply frequency threshold is used to ensure that the brake is applied before the motor frequency reaches zero and to prevent the motor rotating (in the reverse direction due to an overhauling load for example) during the brake apply time. If the frequency falls below *BC Brake Apply Frequency* (12.045), but the motor is not required to stop (i.e. reversing direction without stopping) then *Reference On* (01.011) will be one, and so the brake is not applied. This prevents the brake from activating and de-activating as the motor passes through zero speed. If the frequency falls below *BC Brake Apply Frequency* (12.045) and *Reference On* (01.011) = 0 then the brake will be applied.

Brake controller sequence

The brake controller sequence is shown for forward movement in the diagram below.

Fig.12.6: Brake controller sequence: Open-loop mode

The current detection, frequency detection and *Drive Active* (10.002) levels are used to allow the brake to be released. *BC Brake Delay* (12.046) is the delay allowed after the correct current and frequency levels have been detected before the brake is released. *BC Post-brake Release Delay* (12.047) is the time allowed for the brake to be released before the frequency is allowed to increase above the *BC Brake Release Frequency* (12.044).

Applying the brake as the frequency passes through zero

In Open-loop mode the torque produced may reduce as the frequency passes through zero. To prevent the load from falling during this period in a vertical application, it is possible to apply the brake momentarily to hold the load. If *BC Brake Apply Through Zero Threshold* (12.051) = 0 then the brake is not applied when the frequency passes through zero unless *Reference On* (01.011) = 0. If *BC Brake Apply Through Zero Threshold* (12.051) is non-zero then the brake is always applied when the modulus of frequency is less than *BC Brake Apply Through Zero Threshold* (12.051) even if *Reference On* (01.011) = 1. This ensures that the brake is applied and then released as the frequency passes through zero. *BC Brake Apply Through Zero Threshold* (12.051) should be set to a value that is lower than both *BC Brake Release Frequency* (12.044) and *BC Brake Apply Frequency* (12.045) so that it does not interfere with the control of the brake when starting and stopping.

Forced initial direction

If *BC Initial Direction* (12.050) = 0 then the brake controller operates as described above and the user reference is used to define the direction of operation. If *BC Initial Direction* (12.050) = 1 then *Force Reference Direction* (01.057) is used force the frequency reference to the positive modulus of its value until the end of the post-brake release period whatever the direction of the reference from the user. This can be used for example to ensure that in a vertical application the motor will definitely hold the load at the point when the brake is released. The diagram below shows the brake controller sequence when *BC Initial Direction* (12.050) = 1, but the user reference direction is reverse. It should be noted that *BC Initial Direction* (12.050) has no effect if *BC Brake Apply Through Zero Threshold* (12.051) is non-zero, and that the reference direction is always used as the initial direction, to prevent a condition where the brake would release then apply repeatedly.

If *BC Initial Direction* (12.050) = 2 then *Force Reference Direction* (01.057) is used to force the frequency reference to minus the modulus of its value until the end of the post-brake release period to ensure that the output frequency is negative during this period.

RFC-A

In closed loop mode, the torque produced may reduce as the frequency passes through zero. A brake controller similar to the one used for open loop mode is provided as shown in the diagram below.

The brake controller operates in the same way as the open loop mode brake controller except for the following differences.

1. *Final Demand Reference* (03.001) is used instead of *Output Frequency* (05.001).
2. The frequency thresholds are replaced with estimated frequency thresholds.
3. Current detection is replaced with flux and current detection as described below.

Flux and current detection

The flux and current detection signal is made active to allow the brake to be released when the motor flux exceeds 90% of its rated level. The flux and current detection signal remains active unless the motor current falls below *BC Lower Current Threshold* (12.043) or the drive is disabled. *BC Lower Current Threshold* (12.043) is used to detect if the motor has been disconnected from the drive and should be set to a suitable level to detect this condition.

Parameter	12.041 BC Enable		
Short description	Enables the brake control function		
Mode	RFC-A		
Minimum	0	Maximum	3
Default	0	Units	
Type	8 Bit User Save	Update Rate	Action on exit from edit and reset
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Disable
1	Relay
2	Digital IO
3	User

If *BC Enable* (12.041) = 0, the brake controller is disabled.

If *BC Enable* (12.041) = 1, the brake controller is enabled with I/O set up to control the brake via the relay output. Drive healthy is re-routed to digital I/O.

If *BC Enable* (12.041) = 2, the brake controller is enabled with I/O set up to control the brake via digital I/O. Drive healthy is routed to the relay output.

If *BC Enable* (12.041) = 3, the brake controller is enabled, but no parameters are set up to select the brake output.

Previous value of BC Enable (12.041)	New value of BC Enable (12.041)	Digital I/O 1 Invert (08.011)	Relay 1 Invert (08.018)	Digital I/O 01 mode (08.031)	DO1 Control (08.091)	Relay 1 Control (08.098)
Any	0	0	0	1	0	0
Any	1	0	0	1	15	18
Not 1	2	0	No change	1	18	No change
1	2	0	0	1	18	15
0 or 1	3	0	0	1	0	0
2	3	0	No change	1	0	0

Action will only occur if the drive is inactive, not in UU state and no User Actions are running. Otherwise, the parameter will return to its pre altered value on exit from edit mode.

All parameters are saved if this parameter changes.

See *BC Brake Release* (12.040)

Parameter	12.042 BC Upper Current Threshold		
Short description	Defines the upper current threshold for the brake		
Mode	RFC-A		
Minimum	0	Maximum	200
Default	50	Units	%
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *BC Brake Release* (12.040).

Parameter	12.043 BC Lower Current Threshold		
Short description	Defines the lower current limit for the brake		
Mode	RFC-A		
Minimum	0	Maximum	200
Default	10	Units	%
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

See *BC Brake Release* (12.040).

Parameter	12.044 BC Brake Release Frequency		
Short description	Defines the brake release frequency		
Mode	RFC-A		
Minimum	0.00	Maximum	20.00
Default	1.00	Units	Hz
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

See *BC Brake Release* (12.040).

Parameter	12.045 BC Brake Apply Frequency		
Short description	Defines the brake apply frequency		
Mode	RFC-A		
Minimum	0.00	Maximum	20.00
Default	2.00	Units	Hz
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

See *BC Brake Release* (12.040).

Parameter	12.046 BC Brake Delay		
Short description	Defines the pre-brake release delay		
Mode	RFC-A		
Minimum	0.0	Maximum	25.0
Default	1.0	Units	s
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

See *BC Brake Release* (12.040).

Parameter	12.047 BC Post-brake Release Delay		
Short description	Defines the post-brake release delay		
Mode	RFC-A		
Minimum	0.0	Maximum	25.0
Default	1.0	Units	s
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	1
Coding	RW, BU		

See *BC Brake Release* (12.040).

Parameter	12.050 BC Initial Direction		
Short description	Defines the initial direction of the brake		
Mode	RFC-A		
Minimum	0	Maximum	2
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text
0	Ref
1	Forward
2	Reverse

See *BC Brake Release* (12.040).

Parameter	12.051 BC Brake Apply Through Zero Threshold		
Short description	Defines if the brake is applied through zero threshold		
Mode	RFC-A		
Minimum	0.00	Maximum	20.00
Default	1.00	Units	Hz
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

See *BC Brake Release* (12.040).

Menu 14 – User PID Controller

Mode: RFC-A

PID controllers

One general purpose PID controllers is provided as shown in the diagram below. The sample rate for the PID controllers is always 4ms.

Fig.14.1: PID controllers

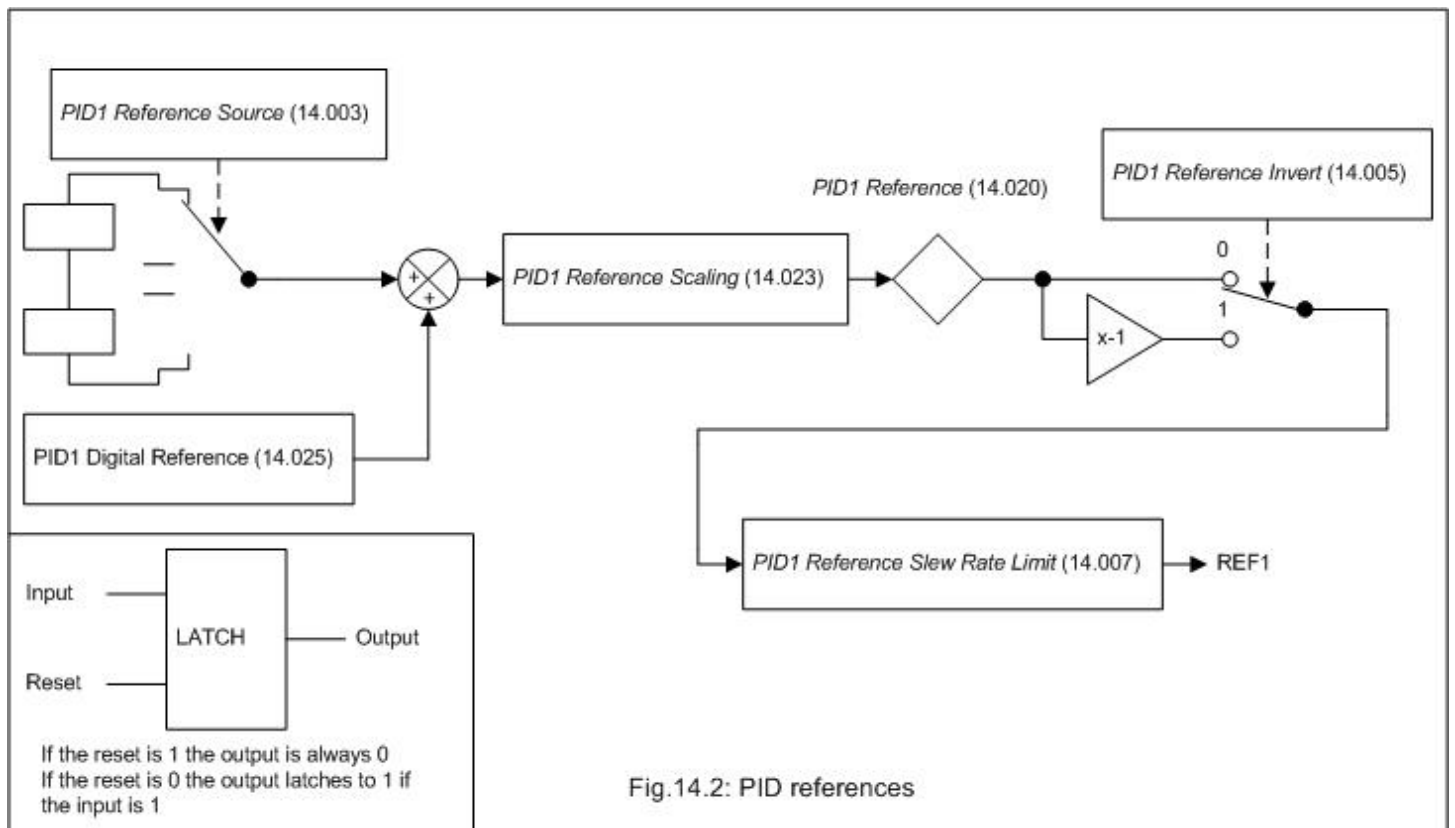

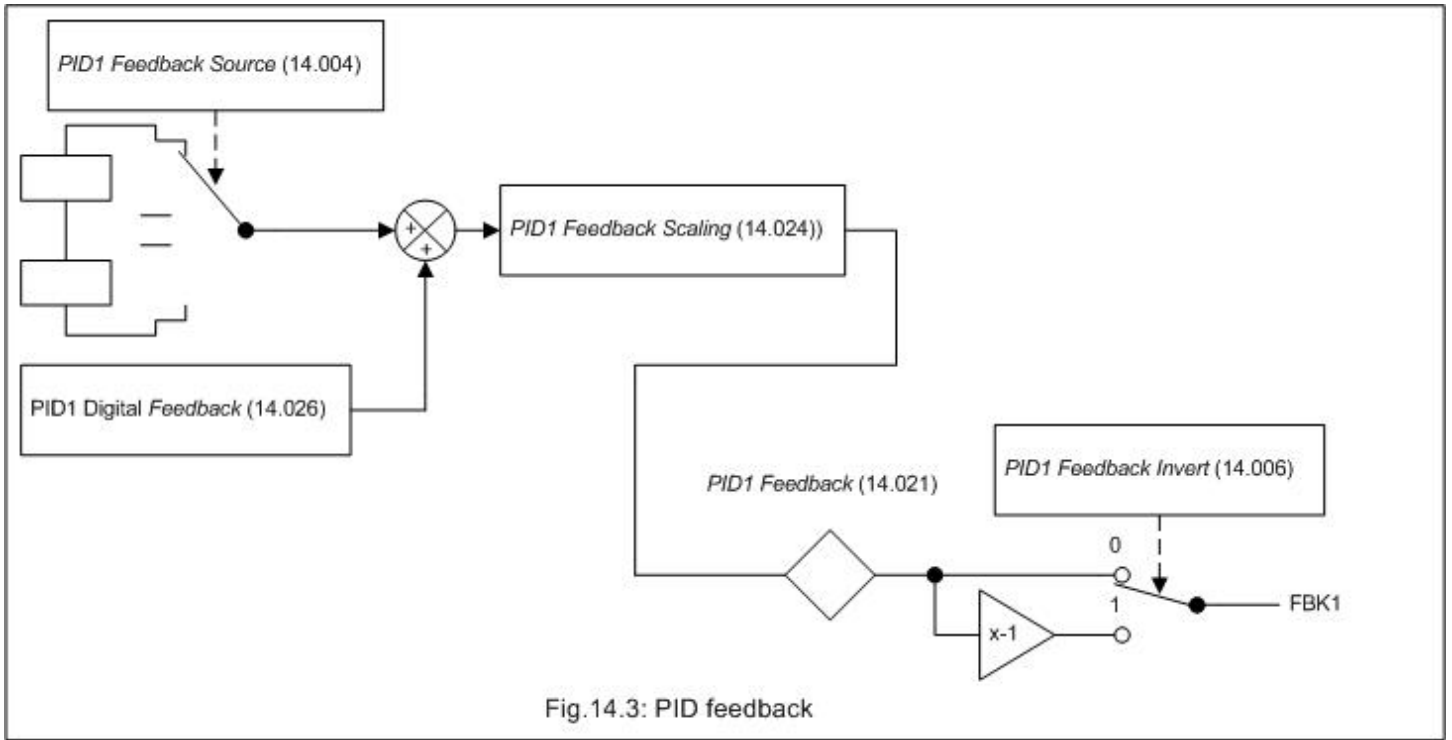

Fig.14.2: PID references

Parameter	14.001 PID1 Output		
Short description	Displays the output for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

Controller

The controller section for the PID controllers is shown in the introduction. If the enable is active the PID controller is active even if the destination is not routed to a valid parameter or to 0.000. It should be noted that if either of the enable sources is routed to 0.000 or to a non-valid parameter the source value is taken as 1, therefore with default settings, *PID1 Enable Source 1* (14.009) = 0.000 and *PID1 Enable Source 2* (14.027) = 0.000, the PID controller can be enabled by simply setting *PID1 Enable* (14.008).

PID1 Error (14.022) is the difference between the reference and feedback produced by the reference and feedback systems described in the previous sections. The PID controller output is defined as follows:

$$PID1\ Output\ (14.001) = PID1\ Error\ (14.022) \times [Kp + Ki/s + sKd/(0.064s + 1)]$$

$$Kp = PID1\ Proportional\ Gain\ (14.010)$$

$$Ki = PID1\ Integral\ Gain\ (14.011)$$

$$Kd = PID1\ Differential\ Gain\ (14.012)$$

Therefore:

1. If *PID1 Error* (14.022) = 100.00% the proportional term gives a value of 100.00% if *PID1 Proportional Gain* (14.010) = 1.000.
2. If *PID1 Error* (14.022) = 100.00% the integral term gives a value that increases linearly by 100.00% per second if *PID1 Integral Gain* (14.011) = 1.000.
3. If *PID1 Error* (14.022) increases linearly by 100.00% per second the differential term gives a value of 100.00% if *PID1 Differential Gain* (14.012) = 1.000. (A filter with a time constant of 64ms is provided on the differential gain to reduce the noise produced by this term.)

The output may be limited to a range that is less than the maximum range of *PID1 Output* (14.001) using *PID1 Output Upper Limit* (14.013) and *PID1 Output Lower Limit* (14.014). If *PID1 Output Lower Limit* (14.014) > *PID1 Output Upper Limit* (14.013) then the output is held at the value defined by *PID1 Output Upper Limit* (14.013). If *PID1 Symmetrical Limit Enable* (14.018) = 1 then the lower limit = -(*PID1 Output Upper Limit* (14.013)). If the output reaches either of these limits the integral term accumulator is frozen until the output moves away from the limit to prevent integral wind-up. The integral hold function can also be enabled by the user by setting *PID1 Integral Hold* (14.017) = 1.

PID1 Output Scaling (14.015) can be used to scale the output, which is limited to a range from -100.00% to 100.00% after this function. The output is then added to *PID1 Feed-forwards Reference* (14.019) and is again limited to the range from -100.00% to 100.00% before being routed to the destination defined by *PID1 Destination* (14.016).

Parameter	14.002 PID1 Feed-forwards Reference Source		
Short description	Defines the input source for the feed-forwards reference source for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Output* (14.001).

Parameter	14.003 PID1 Reference Source		
Short description	Defines the input source for the reference for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

The reference section for the PID controllers is shown in the introduction. The pre-sleep boost control is only included in PID controller 1. The reference sections are always active even if the PID controller itself is disabled or the reference sources are not routed to valid parameters. If a reference source is not a valid parameter or is 0.000 then the value is taken as zero.

The reference *PID1 Digital Reference* (14.025) is multiplied by *PID1 Reference Scaling* (14.023) and then limited to +/-100.00%. The reference can then be inverted if required (*PID1 Reference Invert* (14.005) = 1) and then a slew rate limit is applied with *PID1 Reference Slew Rate* (14.007). This limits the maximum rate of change so that a change from 0.00 to 100.00% takes the time given in *PID1 Reference Slew Rate* (14.007).

Parameter	14.004 PID1 Feedback Source		
Short description	Defines the input source for the feedback for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Feedback

The feedback section for the PID controllers is shown in the introduction. The feedback sections are always active even if the PID controller itself is disabled or the feedback sources are not routed to valid parameters. If a reference source is not a valid parameter or is 0.000 then the value is taken as zero.

The feedback is the sum of the feedback source and the *PID1 Digital Feedback* (14.026). The result is multiplied by *PID1 Feedback Scaling* (14.024) and then limited to +/-100.00%. The feedback can be inverted if required (*PID1 Feedback Invert* (14.006) = 1).

Parameter	14.005 PID1 Reference Invert		
Short description	Set to 1 to invert PID1 reference		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.006 PID1 Feedback Invert		
Short description	Set to 1 to invert the PID1 feedback		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Feedback Source* (14.004).

Parameter	14.007 PID1 Reference Slew Rate		
Short description	Defines the rate in change of output for PID1		
Mode	RFC-A		
Minimum	0.0	Maximum	3200.0
Default	0.0	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.008 PID1 Enable		
Short description	Enables the use of PID1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.009 PID1 Enable Source 1		
Short description	Defines the input source for enabling PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Output* (14.001).

Parameter	14.010 <i>PID1 Proportional Gain</i>		
Short description	Defines the Kp gain used for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.011 <i>PID1 Integral Gain</i>		
Short description	Defines the Ki gain used for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	0.500	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.012 <i>PID1 Differential Gain</i>		
Short description	Defines the Kd gain used for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.013 <i>PID1 Output Upper Limit</i>		
Short description	Defines the maximum value of the output for PID1		
Mode	RFC-A		
Minimum	0.00	Maximum	100.00
Default	100.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.014 <i>PID1 Output Lower Limit</i>		
Short description	Defines the minimum value of the output for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	-100.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.015 <i>PID1 Output Scaling</i>		
Short description	Defines the scaling factor of the output for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.016 PID1 Destination		
Short description	Defines the output parameter for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, DE, PT, BU		

See *PID1 Output* (14.001).

Parameter	14.017 PID1 Integral Hold		
Short description	Enables the integral hold function for PID1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit Volatile	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.018 PID1 Symmetrical Limit Enable		
Short description	Enables the symmetrical limit for PID1		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	1 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

See *PID1 Output* (14.001).

Parameter	14.019 PID1 Feed-forwards Reference		
Short description	Displays the value of the feed-forwards reference for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Output* (14.001).

Parameter	14.020 PID1 Reference		
Short description	Displays the value of the reference for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Reference Source* (14.003).

Parameter	14.021 PID1 Feedback		
Short description	Displays the value of the feedback for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Feedback Source* (14.004).

Parameter	14.022 PID1 Error		
Short description	Displays the value of the error for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default		Units	%
Type	16 Bit Volatile	Update Rate	4ms write
Display Format	Standard	Decimal Places	2
Coding	RO, ND, NC, PT		

See *PID1 Output* (14.001).

Parameter	14.023 PID1 Reference Scaling		
Short description	Defines the scaling factor for the reference for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.024 PID1 Feedback Scaling		
Short description	Defines the scaling factor of the feedback for PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	4.000
Default	1.000	Units	
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	3
Coding	RW		

See *PID1 Feedback Source* (14.004).

Parameter	14.025 PID1 Digital Reference		
Short description	Defines the value of the digital reference for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Reference Source* (14.003).

Parameter	14.026 PID1 Digital Feedback		
Short description	Defines the value of the digital feedback for PID1		
Mode	RFC-A		
Minimum	-100.00	Maximum	100.00
Default	0.00	Units	%
Type	16 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	2
Coding	RW		

See *PID1 Feedback Source* (14.004).

Parameter	14.027 PID1 Enable Source 2		
Short description	Defines the input source for enabling PID1		
Mode	RFC-A		
Minimum	0.000	Maximum	59.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Drive reset read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

See *PID1 Output* (14.001).

Menu 18 – Application Menu 1

Mode: RFC-A

General option module application menus

Menus 18 and 20 are general application menus that can be used by one of the option modules fitted to the drive. These menus are customisable and the following RAM is provided to be shared between all 2 menus.

	1	8	16	32
Volatile	0	0	8	9
User save	19	0	19	0
Power-down save	0	0	1	0

If no option modules provide customisation tables for these menus then the drive provides the customisation tables to give the following parameters.

Parameter	18.001 Application Menu 1 Power-down Save Integer		
Short description	General power-down save integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit Power Down Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.002 Application Menu 1 Read-only Integer 2		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.003 Application Menu 1 Read-only Integer 3		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.004 Application Menu 1 Read-only Integer 4		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.005 Application Menu 1 Read-only Integer 5		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.006 Application Menu 1 Read-only Integer 6		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.007 Application Menu 1 Read-only Integer 7		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.008 Application Menu 1 Read-only Integer 8		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.009 Application Menu 1 Read-only Integer 9		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.010 Application Menu 1 Read-only Integer 10		
Short description	General read-only integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default		Units	
Type	16 Bit Volatile	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RO, PR, ND, NC		

Parameter	18.011 Application Menu 1 Read-write Integer 11		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.012 Application Menu 1 Read-write Integer 12		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.013 Application Menu 1 Read-write Integer 13		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.014 Application Menu 1 Read-write Integer 14		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.015 Application Menu 1 Read-write Integer 15		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.016 Application Menu 1 Read-write Integer 16		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.017 Application Menu 1 Read-write Integer 17		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.018 Application Menu 1 Read-write Integer 18		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.019 Application Menu 1 Read-write Integer 19		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.020 Application Menu 1 Read-write Integer 20		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.021 Application Menu 1 Read-write Integer 21		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.022 Application Menu 1 Read-write Integer 22		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.023 Application Menu 1 Read-write Integer 23		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.024 Application Menu 1 Read-write Integer 24		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.025 Application Menu 1 Read-write Integer 25		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.026 Application Menu 1 Read-write Integer 26		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.027 Application Menu 1 Read-write Integer 27		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.028 Application Menu 1 Read-write Integer 28		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.029 Application Menu 1 Read-write Integer 29		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.030 Application Menu 1 Read-write Integer 30		
Short description	General read-write integer application parameter		
Mode	RFC-A		
Minimum	-32768	Maximum	32767
Default	0	Units	
Type	16 Bit User Save	Update Rate	N/A
Display Format	Standard	Decimal Places	0
Coding	RW		

Parameter	18.031 Application Menu 1 Read-write bit 31		
Short description	General read-write bit application parameter		
Mode	RFC-A		
Minimum	0	Maximum	1

Menu 21 – Motor 2 Parameters

Mode: RFC-A

If *Select Motor 2 Parameters* (11.045) = 1 then the motor set-up parameters given in the table below are used instead of the equivalent parameters in other menus. The motor 2 parameters have the same attributes etc. as the equivalent parameters in other menus.

Parameter	Motor map 2 parameter	Equivalent parameter
21.001	M2 Maximum Reference Clamp (21.001)	Maximum Reference Clamp (01.006)
21.002	M2 Minimum Reference Clamp (21.002)	Minimum Reference Clamp (01.007)
21.003	M2 Reference Selector (21.003)	Reference Selector (01.014)
21.004	M2 Acceleration Rate 1 (21.004)	Acceleration Rate 1 (02.011)
21.005	M2 Deceleration Rate 1 (21.005)	Deceleration Rate 1 (02.021)
21.006	M2 Motor Rated Frequency (21.006)	Motor Rated Frequency (05.006)
21.007	M2 Motor Rated Current (21.007)	Motor Rated Current (05.007)
21.008	M2 Motor Rated Speed (21.008)	Motor Rated Speed (05.008)
21.009	M2 Motor Rated Voltage (21.009)	Motor Rated Voltage (05.009)
21.010	M2 Motor Rated Power Factor (21.010)	Motor Rated Power Factor (05.010)
21.011	M2 Number of Motor Poles (21.011)	Number Of Motor Poles (05.011)
21.012	M2 Stator Resistance (21.012)	Stator Resistance
21.014	M2 Transient Inductance (21.014)	Transient Inductance (05.024)
21.015	Motor 2 Active (21.015)	N/A
21.016	M2 Motor Thermal Time Constant 1 (21.016)	Motor Thermal Time Constant 1
21.017	M2 Frequency Controller Proportional Gain Kp1 (21.017)	Frequency Controller Proportional Gain Kp1 (03.010)
21.018	M2 Frequency Controller Integral Gain Ki1 (21.018)	Frequency Controller Integral Gain Ki1 (03.011)
21.019	M2 Frequency Controller Differential Feedback Gain Kd1 (21.019)	Frequency Controller Differential Feedback Gain Kd1 (03.012)
21.022	M2 Current Controller Kp Gain (21.022)	Current Controller Kp Gain (04.013)
21.023	M2 Current Controller Ki Gain (21.023)	Current Controller Ki Gain (04.014)
21.024	M2 Stator Inductance (21.024)	Stator Inductance (05.025)
21.025	M2 Saturation Breakpoint 1 (21.025)	Saturation Breakpoint 1 (05.029)
21.026	M2 Saturation Breakpoint 3 (21.026)	Saturation Breakpoint 3 (05.030)
21.027	M2 Motoring Current Limit (21.027)	Motoring Current Limit (04.005)
21.028	M2 Regenerating Current Limit (21.028)	Regenerating Current Limit (04.006)
21.029	M2 Symmetrical Current Limit (21.029)	Symmetrical Current Limit (04.007)
21.033	M2 Low Frequency Thermal Protection Mode (21.033)	Low Frequency Thermal Protection Mode (04.025)
21.041	M2 Saturation Breakpoint 2 (21.041)	Saturation Breakpoint 2 (05.062)
21.042	M2 Saturation Breakpoint 4 (21.042)	Saturation Breakpoint 4 (05.063)

Parameter	21.001 M2 Maximum Reference Clamp		
Short description	Defines the maximum reference clamp for motor map 2		
Mode	RFC-A		
Minimum	-VM_POSITIVE_REF_CLAMP	Maximum	VM_POSITIVE_REF_CLAMP
Default	See exceptions below	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

Region	Default Value
50Hz	50.00
60Hz	60.00

This is the motor map 2 equivalent parameter for *Maximum Reference Clamp* (01.006).

Parameter	21.002 M2 Minimum Reference Clamp		
Short description	Defines the minimum reference clamp for motor map 2		
Mode	RFC-A		
Minimum	-VM_NEGATIVE_REF_CLAMP2	Maximum	VM_NEGATIVE_REF_CLAMP2
Default	0.00	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, VM		

This is the motor map 2 equivalent for *Minimum Reference Clamp* (01.007).

Parameter	21.003 M2 Reference Selector		
Short description	Defines which reference is used for motor map 2		
Mode	RFC-A		
Minimum	0	Maximum	6
Default	0	Units	
Type	8 Bit User Save	Update Rate	4ms read
Display Format	Standard	Decimal Places	0
Coding	RW, TE		

Value	Text	Description
0	A1 A2	Analogue reference 1 or 2 selected by terminal input
1	A1 Preset	Analogue reference 1 or Presets selected by terminal input
2	A2 Preset	Analogue reference 2 or Presets selected by terminal input
3	Preset	Preset reference selected by terminal
4	Keypad	Keypad reference selected
5	Reserved	Reserved
6	Keypad Ref	Keypad reference selected but no control mode

This is the motor map 2 equivalent for *Reference Selector* (01.014).

Parameter	21.004 M2 Acceleration Rate 1		
Short description	Defines the acceleration rate used for motor map 2		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	5.0	Units	
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

This is the motor map 2 equivalent for *Acceleration Rate 1* (02.011).

Parameter	21.005 M2 Deceleration Rate 1		
Short description	Defines the deceleration rate used for motor map 2		
Mode	RFC-A		
Minimum	-VM_ACCEL_RATE	Maximum	VM_ACCEL_RATE
Default	10.0	Units	
Type	32 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM		

This is the motor map 2 equivalent for *Acceleration Rate 1* (02.011).

Parameter	21.006 M2 Motor Rated Frequency		
Short description	Defines the motor rated frequency used for motor map 2		
Mode	RFC-A		
Minimum	0.00	Maximum	550.00
Default	See exceptions below	Units	Hz
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

Region	Default Value
50Hz	50.00
60Hz	60.00

This is the motor map 2 equivalent for *Motor Rated Frequency* (05.006).

Parameter	21.007 M2 Motor Rated Current		
Short description	Defines the motor rated used for motor map 2		
Mode	RFC-A		
Minimum	-VM_RATED_CURRENT	Maximum	VM_RATED_CURRENT
Default	0.00	Units	A
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, VM, RA		

This is the motor map 2 equivalent for *Motor Rated Current* (05.007).

Parameter	21.008 M2 Motor Rated Speed		
Short description	Defines the motor rated speed used for motor map 2		
Mode	RFC-A		
Minimum	0.0	Maximum	80000.0
Default	See exceptions below	Units	rpm
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

Region	Default Value
50Hz	1500.0
60Hz	1800.0

This is the motor map 2 equivalent for *Motor Rated Speed* (05.008).

Parameter	21.009 M2 Motor Rated Voltage		
Short description	Defines the motor rated voltage used for motor map 2		
Mode	RFC-A		
Minimum	-VM_AC_VOLTAGE_SET	Maximum	VM_AC_VOLTAGE_SET
Default	See exceptions below	Units	V
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	0
Coding	RW, VM, RA		

Voltage	Region	Default Value
110V	All	230
200V	All	230
400V	50Hz	400
400V	60Hz	460
575V	All	575
690V	All	690

This is the motor map 2 equivalent for *Motor Rated Voltage* (05.009).

Parameter	21.010 M2 Motor Rated Power Factor		
Short description	Defines the motor rated power factor used for motor map 2		
Mode	RFC-A		
Minimum	0.00	Maximum	1.00
Default	0.85	Units	
Type	16 Bit User Save	Update Rate	Background read/write
Display Format	Standard	Decimal Places	2
Coding	RW, RA		

This is the motor map 2 equivalent for *Motor Rated Power Factor* (05.010).

Parameter	21.011 M2 Number of Motor Poles		
Short description	Defines the number of motor poles used for motor map 2		
Mode	RFC-A		
Minimum	0	Maximum	16
Default	0	Units	PolePairs
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW, BU		

This is the motor map 2 equivalent for *Number Of Motor Poles* (05.011).

Parameter	21.012 M2 Stator Resistance		
Short description	Defines the stator resistance used for motor map 2		
Mode	RFC-A		
Minimum	0.0000	Maximum	99.9999
Default	0.0000	Units	Ω
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	4
Coding	RW, RA		

This is the motor map 2 equivalent for *Stator Resistance* (05.017).

Parameter	21.014 M2 Transient Inductance		
Short description	Defines the transient inductance used for motor map 2		
Mode	RFC-A		
Minimum	0.000	Maximum	500.000
Default	0.000	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, RA		

This is the motor map 2 equivalent for *Transient Inductance* (05.024).

Parameter	21.015 Motor 2 Active		
Short description	Indicates if motor 2 parameters are being used by the drive		
Mode	RFC-A		
Minimum	0	Maximum	1
Default		Units	
Type	1 Bit Volatile	Update Rate	Background write
Display Format	Standard	Decimal Places	0
Coding	RO, ND, NC, PT		

If *Motor 2 Active* (21.015) = 0 then the standard motor set-up parameters are being used or if *Motor 2 Active* (21.015) = 1 then the motor 2 parameters are being used. The motor set-up parameters do not necessarily change immediately when *Select Motor 2 Parameters* (11.045) is changed (i.e. the drive may be enabled). *Motor 2 Active* (21.015) shows the actual motor parameters being used and only changes when the new parameters start being used by the drive.

Parameter	21.016 M2 Motor Thermal Time Constant 1		
Short description	Defines the thermal time constant of the motor used for motor map 2		
Mode	RFC-A		
Minimum	1	Maximum	3000
Default	179	Units	s
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

This is the motor map 2 equivalent of *Motor Thermal Time Constant 1* (04.015).

Parameter	21.017 M2 Frequency Controller Proportional Gain Kp1		
Short description	Defines the Kp value of the frequency controller used for motor map 2		
Mode	RFC-A		
Minimum	0.000	Maximum	200.000
Default	0.100	Units	s/rad
Type	32 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	3
Coding	RW		

This is the motor map 2 equivalent for *Frequency Controller Proportional Gain Kp1* (03.010).

Parameter	21.018 M2 Frequency Controller Integral Gain Ki1		
Short description	Defines the Ki value of the frequency controller used for motor map 2		
Mode	RFC-A		
Minimum	0.00	Maximum	655.35
Default	0.10	Units	s ² /rad
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	2
Coding	RW, BU		

This is the motor map 2 equivalent for *Frequency Controller Integral Gain Ki1* (03.011).

Parameter	21.019 M2 Frequency Controller Differential Feedback Gain Kd1		
Short description	Defines the Kd value of the frequency controller used for motor map 2		
Mode	RFC-A		
Minimum	0.00000	Maximum	0.65535
Default	0.00000	Units	1/rad
Type	16 Bit User Save	Update Rate	Background
Display Format	Standard	Decimal Places	5
Coding	RW, BU		

This is the motor map 2 equivalent for *Frequency Controller Differential Feedback Gain Kd1* (03.012).

Parameter	21.022 M2 Current Controller Kp Gain		
Short description	Defines the Kp value of the current controller used for motor map 2		
Mode	RFC-A		
Minimum	0.00	Maximum	4000.00
Default	20.00	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW		

This is the motor map 2 equivalent for *Current Controller Kp Gain* (04.013).

Parameter	21.023 M2 Current Controller Ki Gain		
Short description	Defines the Ki value of the current controller used for motor map 2		
Mode	RFC-A		
Minimum	0.000	Maximum	600.000
Default	40.000	Units	
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW		

This is the motor map 2 equivalent for *Current Controller Ki Gain* (04.014).

Parameter	21.024 M2 Stator Inductance		
Short description	Defines the stator inductance of the motor used for motor map 2		
Mode	RFC-A		
Minimum	0.00	Maximum	5000.00
Default	0.00	Units	mH
Type	32 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	2
Coding	RW, RA		

This is the motor map 2 equivalent for *Stator Inductance* (05.025).

Parameter	21.025 M2 Saturation Breakpoint 1		
Short description	Defines the 1st saturation breakpoint for motor map 2		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default	50.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

This is the motor map 2 equivalent for *Saturation Breakpoint 1* (05.029).

Parameter	21.026 M2 Saturation Breakpoint 3		
Short description	Defines the 3rd saturation breakpoint for motor map 2		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default	75.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

This is the motor map 2 equivalent for *Saturation Breakpoint 3* (05.030).

Parameter	21.027 M2 Motoring Current Limit		
Short description	Defines the motoring current limit used for motor map 2		
Mode	RFC-A		
Minimum	-VM_MOTOR2_CURRENT_LIMIT	Maximum	VM_MOTOR2_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

This is the motor map 2 equivalent for *Motoring Current Limit* (04.005).

Parameter	21.028 M2 Regenerating Current Limit		
Short description			
Mode	RFC-A		
Minimum	-VM_MOTOR2_CURRENT_LIMIT	Maximum	VM_MOTOR2_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

This is the motor map 2 equivalent for *Regenerating Current Limit* (04.006).

Parameter	21.029 M2 Symmetrical Current Limit		
Short description	Defines the symmetrical current limit used for motor map 2		
Mode	RFC-A		
Minimum	-VM_MOTOR2_CURRENT_LIMIT	Maximum	VM_MOTOR2_CURRENT_LIMIT
Default	165.0	Units	%
Type	16 Bit User Save	Update Rate	16ms
Display Format	Standard	Decimal Places	1
Coding	RW, VM, RA		

This is the motor map 2 equivalent for *Symmetrical Current Limit* (04.007).

Parameter	21.033 M2 Low Frequency Thermal Protection Mode		
Short description	Set to enable low frequency thermal protection mod		
Mode	RFC-A		
Minimum	0	Maximum	1
Default	0	Units	
Type	8 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	0
Coding	RW		

This is the motor map 2 equivalent for *Low Frequency Thermal Protection Mode* (04.025).

Parameter	21.041 M2 Saturation Breakpoint 2		
Short description	Defines the 2nd saturation breakpoint for motor map 2		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

This is the motor map 2 equivalent for *Saturation Breakpoint 2* (05.062).

Parameter	21.042 M2 Saturation Breakpoint 4		
Short description	Defines the 4th saturation breakpoint for motor map 2		
Mode	RFC-A		
Minimum	0.0	Maximum	100.0
Default	0.0	Units	%
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	1
Coding	RW		

This is the motor map 2 equivalent for *Saturation Breakpoint 4* (05.063).

Mode: RFC-A

Parameter	22.001 Parameter 00.001 Set-up		
Short description	Defines the parameter to be shown in 00.001		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.007	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.002 Parameter 00.002 Set-up		
Short description	Defines the parameter to be shown in 00.002		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.006	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.003 Parameter 00.003 Set-up		
Short description	Defines the parameter to be shown in 00.003		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	2.011	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.004 Parameter 00.004 Set-up		
Short description	Defines the parameter to be shown in 00.004		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	2.021	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.005 Parameter 00.005 Set-up		
Short description	Defines the parameter to be shown in 00.005		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.034	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.006 Parameter 00.006 Set-up		
Short description	Defines the parameter to be shown in 00.006		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.007	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.007 Parameter 00.007 Set-up		
Short description	Defines the parameter to be shown in 00.007		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.008	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.008 Parameter 00.008 Set-up		
Short description	Defines the parameter to be shown in 00.008		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.009	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.009 Parameter 00.009 Set-up		
Short description	Defines the parameter to be shown in 00.009		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.010	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.010 Parameter 00.010 Set-up		
Short description	Defines the parameter to be shown in 00.010		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.044	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.011 Parameter 00.011 Set-up		
Short description	Defines the parameter to be shown in 00.011		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.012 Parameter 00.012 Set-up		
Short description	Defines the parameter to be shown in 00.012		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	8.010	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.013 Parameter 00.013 Set-up		
Short description	Defines the parameter to be shown in 00.013		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.014 Parameter 00.014 Set-up		
Short description	Defines the parameter to be shown in 00.014		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.015 Parameter 00.015 Set-up		
Short description	Defines the parameter to be shown in 00.015		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.005	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.016 Parameter 00.016 Set-up		
Short description	Defines the parameter to be shown in 00.016		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	7.007	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.017 Parameter 00.017 Set-up		
Short description	Defines the parameter to be shown in 00.017		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.010	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.018 Parameter 00.018 Set-up		
Short description	Defines the parameter to be shown in 00.018		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.021	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.019 Parameter 00.019 Set-up		
Short description	Defines the parameter to be shown in 00.019		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.020 Parameter 00.020 Set-up		
Short description	Defines the parameter to be shown in 00.020		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.021 Parameter 00.021 Set-up		
Short description	Defines the parameter to be shown in 00.021		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.022 Parameter 00.022 Set-up		
Short description	Defines the parameter to be shown in 00.022		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.023 Parameter 00.023 Set-up		
Short description	Defines the parameter to be shown in 00.023		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.024 Parameter 00.024 Set-up		
Short description	Defines the parameter to be shown in 00.024		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.025 Parameter 00.025 Set-up		
Short description	Defines the parameter to be shown in 00.025		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.030	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.026 Parameter 00.026 Set-up		
Short description	Defines the parameter to be shown in 00.026		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.027 Parameter 00.027 Set-up		
Short description	Defines the parameter to be shown in 00.027		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	1.051	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.028 Parameter 00.028 Set-up		
Short description	Defines the parameter to be shown in 00.028		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	2.004	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.029 Parameter 00.029 Set-up		
Short description	Defines the parameter to be shown in 00.029		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	2.002	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.030 Parameter 00.030 Set-up		
Short description	Defines the parameter to be shown in 00.030		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.042	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.031 Parameter 00.031 Set-up		
Short description	Defines the parameter to be shown in 00.031		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	6.001	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.032 Parameter 00.032 Set-up		
Short description	Defines the parameter to be shown in 00.032		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.013	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.033 Parameter 00.033 Set-up		
Short description	Defines the parameter to be shown in 00.033		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	6.009	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.034 Parameter 00.034 Set-up		
Short description	Defines the parameter to be shown in 00.034		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	8.035	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.035 Parameter 00.035 Set-up		
Short description	Defines the parameter to be shown in 00.035		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	8.091	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.036 Parameter 00.036 Set-up		
Short description	Defines the parameter to be shown in 00.036		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	7.055	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.037 Parameter 00.037 Set-up		
Short description	Defines the parameter to be shown in 00.037		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.018	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.038 Parameter 00.038 Set-up		
Short description	Defines the parameter to be shown in 00.038		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.012	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.039 Parameter 00.039 Set-up		
Short description	Defines the parameter to be shown in 00.039		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.006	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.040 Parameter 00.040 Set-up		
Short description	Defines the parameter to be shown in 00.040		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.011	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.041 Parameter 00.041 Set-up		
Short description	Defines the parameter to be shown in 00.041		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.014	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.042 Parameter 00.042 Set-up		
Short description	Defines the parameter to be shown in 00.042		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.015	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.043 Parameter 00.043 Set-up		
Short description	Defines the parameter to be shown in 00.043		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.025	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.044 Parameter 00.044 Set-up		
Short description	Defines the parameter to be shown in 00.044		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.023	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.045 Parameter 00.045 Set-up		
Short description	Defines the parameter to be shown in 00.045		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.020	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.046 Parameter 00.046 Set-up		
Short description	Defines the parameter to be shown in 00.046		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999

Coding	RW, PT, BU		

Parameter	22.047 Parameter 00.047 Set-up		
Short description	Defines the parameter to be shown in 00.047		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.043	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.048 Parameter 00.048 Set-up		
Short description	Defines the parameter to be shown in 00.048		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.044	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.049 Parameter 00.049 Set-up		
Short description	Defines the parameter to be shown in 00.049		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.045	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.050 Parameter 00.050 Set-up		
Short description	Defines the parameter to be shown in 00.050		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.046	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.051 Parameter 00.051 Set-up		
Short description	Defines the parameter to be shown in 00.051		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.047	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.052 Parameter 00.052 Set-up		
Short description	Defines the parameter to be shown in 00.052		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.048	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.053 Parameter 00.053 Set-up		
Short description	Defines the parameter to be shown in 00.053		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.050	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.054 Parameter 00.054 Set-up		
Short description	Defines the parameter to be shown in 00.054		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.051	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.055 Parameter 00.055 Set-up		
Short description	Defines the parameter to be shown in 00.055		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	12.041	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.056 Parameter 00.056 Set-up		
Short description	Defines the parameter to be shown in 00.056		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.057 Parameter 00.057 Set-up		
Short description	Defines the parameter to be shown in 00.057		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.058 Parameter 00.058 Set-up		
Short description	Defines the parameter to be shown in 00.058		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.059 Parameter 00.059 Set-up		
Short description	Defines the parameter to be shown in 00.059		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.047	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.060 Parameter 00.060 Set-up		
Short description	Defines the parameter to be shown in 00.060		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.061 Parameter 00.061 Set-up		
Short description	Defines the parameter to be shown in 00.061		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.062 Parameter 00.062 Set-up		
Short description	Defines the parameter to be shown in 00.062		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.063 Parameter 00.063 Set-up		
Short description	Defines the parameter to be shown in 00.063		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.064 Parameter 00.064 Set-up		
Short description	Defines the parameter to be shown in 00.064		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.065 Parameter 00.065 Set-up		
Short description	Defines the parameter to be shown in 00.065		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	3.010	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.066 Parameter 00.066 Set-up		
Short description	Defines the parameter to be shown in 00.066		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	3.011	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.067 Parameter 00.067 Set-up		
Short description	Defines the parameter to be shown in 00.067		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	3.079	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.068 Parameter 00.068 Set-up		
Short description	Defines the parameter to be shown in 00.068		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.069 Parameter 00.069 Set-up		
Short description	Defines the parameter to be shown in 00.069		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	5.040	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.070 Parameter 00.070 Set-up		
Short description	Defines the parameter to be shown in 00.070		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.071 Parameter 00.071 Set-up		
Short description	Defines the parameter to be shown in 00.071		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.072 Parameter 00.072 Set-up		
Short description	Defines the parameter to be shown in 00.072		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.073 Parameter 00.073 Set-up		
Short description	Defines the parameter to be shown in 00.073		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.074 Parameter 00.074 Set-up		
Short description	Defines the parameter to be shown in 00.074		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.075 Parameter 00.075 Set-up		
Short description	Defines the parameter to be shown in 00.075		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.076 Parameter 00.076 Set-up		
Short description	Defines the parameter to be shown in 00.076		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	10.037	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.077 Parameter 00.077 Set-up		
Short description	Defines the parameter to be shown in 00.077		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.032	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.078 Parameter 00.078 Set-up		
Short description	Defines the parameter to be shown in 00.078		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.029	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.079 Parameter 00.079 Set-up		
Short description	Defines the parameter to be shown in 00.079		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	11.031	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Parameter	22.080 Parameter 00.080 Set-up		
Short description	Defines the parameter to be shown in 00.080		
Mode	RFC-A		
Minimum	0.000	Maximum	30.999
Default	0.000	Units	
Type	16 Bit User Save	Update Rate	Background read
Display Format	Standard	Decimal Places	3
Coding	RW, PT, BU		

Trips

Mode: RFC-A

Trip 0 (10.020) to *Trip 9* (10.029) store the most recent 10 trips that have occurred where *Trip 0* (10.020) is the most recent and *Trip 9* (10.029) is the oldest. When a new trip occurs it is written to *Trip 0* (10.020) and all the other trips move down the log, with oldest being lost.

The date and time when each trip occurs are also stored in the date and time log, i.e. *Trip 0 Date* (10.041) to *Trip 9 Time* (10.060). The date and time are taken from *Date* (06.016) and *Time* (06.017) (See *Date/Time Selector* (06.019)). Some trips have sub-trip numbers which give more detail about the reason for the trip. If a trip has a sub-trip number its value is stored in the sub-trip log, i.e. *Trip 0 Sub-trip Number* (10.070) to *Trip 9 Sub-trip Number* (10.079). If the trip does not have a sub-trip number then zero is stored in the sub-trip log.

Trip categories and priorities

Trips are grouped into the categories given in the table below. A trip can only occur when the drive is not tripped, or if it is already tripped and the new trip has a higher priority than the active trip (i.e. lower priority number). Unless otherwise stated a trip cannot be reset until 1.0s after it has been initiated.

Priority	Category	Trips	Comments
1	Internal faults	HF01 - HF19	These are fatal problems that cannot be reset. All drive features are inactive after any of these trips occur. If a basic keypad is fitted it will show the trip, but the keypad will not function. These trips are not stored in the trip log.
1	Stored HF trip	<i>Stored HF</i>	This trip cannot be cleared unless 1299 is entered into <i>Parameter mm.000</i> (mm.000) and a reset is initiated.
2	Non-resettable trips	Trip numbers 218 - 247 and <i>Slot1 HF</i>	These trips cannot be reset.
3	Volatile memory failure	<i>EEPROM Fail</i>	This can only be reset if <i>Parameter mm.000</i> (mm.000) is set to 1233 or 1244, or if <i>Load Defaults</i> (11.043) is set to a non-zero value
4	Non-volatile media trips	Trip numbers 174, 175 and 177 - 188	These trips are priority 5 during power-up
5	Trips with extended reset times	<i>OI ac</i> , <i>OI Brake</i> and <i>Reserved</i>	These trips cannot be reset until 10s after the trip was initiated.
5	Phase loss and d.c. link power circuit protection	<i>Phase Loss</i> and <i>OHT dc bus</i>	The drive will attempt to stop the motor before tripping if a <i>Phase Loss.000</i> trip occurs unless this feature has been disabled (see <i>Action On Trip Detection</i> (10.037)). The drive will always attempt to stop the motor before tripping if an <i>OHT dc bus</i> occurs.
5	Standard trips	All other trips	

Trips {HF01} to {HF19} are internal faults that do not have trip numbers. If one of these trips occurs, the main drive processor has detected an irrecoverable error. All drive functions are stopped and the trip message will be displayed on the drive keypad. The error can only be reset by powering the drive down and up again. The table below gives the reasons for internal faults and their corresponding trip

Trip	Reason	
{HF01}	CPU hardware fault during exception processing	
{HF02}	CPU memory management fault is an exception that occurs because of a memory protection related fault	
{HF03}	CPU has detected a Bus Fault. A Bus Fault is an exception that occurs because of a memory related fault for an instruction or data memory transaction. This might be from an error detected on a bus in the memory system.	
{HF04}	<p>CPU has detected a usage fault: A Usage Fault is an exception that occurs because of a fault related to instruction execution. This includes:</p> <ul style="list-style-type: none"> • an undefined instruction • an illegal unaligned access • invalid state on instruction execution • an error on exception return. <p>The following can cause a Usage Fault when the core is configured to report them:</p> <ul style="list-style-type: none"> • an unaligned address on word and half word memory access • division by zero. 	
{HF05}	Reserved	
{HF06}	Reserved	
{HF07}	Watchdog failure	
{HF08}	CPU Interrupt crash. Interrupt crash level indicated by subtrip number.	
{HF09}	Free store overflow	
{HF10}	Reserved	
{HF11}	The <i>HF11</i> trip indicates that a non-volatile memory comms error has occurred.	
	Sub-trip	Reason
	Recommended action	
1	Non-volatile memory comms error.	Hardware fault – contact the supplier of the drive.
2	EEPROM size is incompatible with the user firmware.	After 1min the drive will go to its bootloader. Re-program drive with compatible user firmware using UniMConnect
{HF12}	Stack overflow	
	Sub-trip	Reason
	1	User program or derivative background stack overflow
	2	User program or derivative timed stack overflow
	3	Main system interrupt stack overflow
4	Main system background stack overflow	
{HF13}	Reserved	
{HF14}	Reserved	
{HF15}	Reserved	
{HF16}	RTOS error (the background task has returned)	
{HF17}	Reserved	
	The <i>HF18</i> trip indicates that the internal flash memory has failed when writing option module parameter data. The reason for the trip can be identified by the sub-trip number.	

	Sub-trip	Reason
{HF18}	1	Option module initialization timed out
	2	Programming error while writing menu in flash
	3	Erase flash block containing setup menus failed
	4	Erase flash block containing application menus failed
	5	Incorrect setup menu CRC contained in flash
	6	Incorrect application menu CRC contained in flash
{HF19}	The <i>HF19</i> trip indicates that the drive firmware is partially or completely deleted. The drive is now in its bootloader and is waiting for a new image to be downloaded using UniMConnect. Once a new image is downloaded, the drive can run normally.	

When the drive is subsequently powered up a *Stored HF* trip is initiated where the sub-trip number is the number of the HF trip that last occurred. This trip will occur at every power-up until it is reset. The trip can only be reset by first entering 1299 into *Parameter mm.000* (mm.000). If the drive is powered up and a *Stored HF* trip occurs, *Onboard User Program: Enable* (11.047) is reset to zero to prevent the on-board user program from running. This ensures that the user program can be changed or erased in case it causes an HF trip at every power-up

Trip descriptions

Trips shown in the table below can be generated either from the drive control system or from the power system. The sub-trip number which is in the form *xyzz* is used to identify the source of the trip. The digits *xx* are 00 for a trip generated by the control system or the number of a power module if generated by the power system. If the drive is not a multi-power module drive then *xx* will always have a value of 1 the trip is related to the power system. The *y* digit is used to identify the location of a trip which is generated by a rectifier module connected to a power module. Where the *y* digit is relevant it will have a value of 1 or more, otherwise it will be 0. The *zz* digits give the reason for the trip and are defined in each trip description.

<i>Over Volts</i>	<i>Oht dc bus</i>
<i>OI ac</i>	<i>Phase Loss</i>
<i>OI Brake</i>	<i>LF Power Comms</i>
<i>PSU</i>	<i>OI Snubber</i>
<i>Oht Inverter</i>	<i>Reserved</i>

Trips (alphabetical order)

Trip	An Input 1 Loss
Value	28
Short description	

Indicates that a current loss was detected in current mode on Analog Input 1. In 4-20mA and 20-4mA modes. loss of input is detected if the current falls below 3mA. See *Analogue Input 1 Mode* (07.007) for further details.

Recommended actions:

- Check control wiring is correct.
- Check control wiring is undamaged.
- Check *Analogue Input 1 Mode* (07.007).
- Check that the current signal is present and greater than 3mA

Trip	An Input 1 OI
Value	189
Short description	

Analogue input 1 over current.

Trip	An Input 2 Loss
Value	29
Short description	

Indicates that a current loss was detected in current mode on Analog Input 2. In 4-20mA and 20-4mA modes. loss of input is detected if the current falls below 3mA. See *Analogue Input 2 Mode* (07.011) for further details.

Recommended actions:

- Check control wiring is correct.
- Check control wiring is undamaged.
- Check *Analogue Input 2 Mode* (07.011).
- Check that the current signal is present and greater than 3mA

Trip	An Input 2 OI
Value	190
Short description	

Analogue input 2 over current.

Trip	An Input 3 Loss
Value	39
Short description	

Indicates that a current loss was detected in current mode on Analog Input 3. In 4-20mA and 20-4mA modes. loss of input is detected if the current falls below 3mA. See *Analogue I/O 3 Mode* (07.015) for further details.

Recommended actions:

- Check control wiring is correct.
- Check control wiring is undamaged.
- Check *Analogue I/O 3 Mode* (07.015)
- Check that the current signal is present and greater than 3mA

Trip	An Input 3 OI
Value	191
Short description	

Not supported

Trip	Autotune 1
Value	11
Short description	

The drive has tripped during an auto-tune. The cause of the trip can be identified from the sub-trip number.

Sub-trip	Reason
1	Reserved
2	The motor did not reach the required speed during rotating auto-tune or mechanical load measurement.

Recommended actions:

- Ensure the motor is free to turn i.e. mechanical brake is released.
- Ensure *Mechanical Load Test Level* (05.021) is set correctly

Trip	Autotune 3
Value	13
Short description	

The drive has tripped during a rotating auto-tune or mechanical load measurement. The cause of the trip can be identified from the associated sub-trip number.

Sub-trip	Reason
1	Measured inertia has exceeded the parameter range during a mechanical load measurement.
2	Reserved
3	The mechanical load test has been unable to identify the motor inertia.

Recommended actions:

- Check motor cable wiring is correct.

Recommended actions for sub-trip 3:

- Increase the test level.
- If the test was carried out at standstill repeat the test with the motor rotating within the recommended speed range.

Trip	Autotune Stopped
Value	18
Short description	

The drive was prevented from completing an auto-tune, because either the Final drive enable or the Final drive run were removed.

Recommended actions:

- Check the drive enable signal (Terminal 31&34) was active during the auto-tune.
- Check the run command was active in *Digital Input 5 State* (08.005) during the auto-tune.

Trip	Brake R Too Hot
Value	19
Short description	

This trip indicates that braking resistor overload has timed out. The value in *Braking Resistor Thermal Accumulator* (10.039) is calculated using *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061). This trip is initiated when *Braking Resistor Thermal Accumulator* (10.039) reaches 100%.

Recommended actions:

- Ensure the values entered in *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061) are correct.
- If an external thermal protection device is being used and the braking resistor software overload protection is not required, set *Braking Resistor Rated Power* (10.030), *Braking Resistor Thermal Time Constant* (10.031) and *Braking Resistor Resistance* (10.061) to 0 to disable the trip.

Trip	Card Access
Value	185
Short description	

A communications failure has occurred with a NV media card. If this occurs during a data transfer to the card then the file being written may be corrupted. If this occurs when data is being transferred from the card then the data transfer may be incomplete. If a parameter file is transferred to the drive and this trip occurs during the transfer the parameters are not saved to non-volatile memory, and so the original parameters can be restored by powering the drive down and up again.

Recommended actions:

- Check the NV media card is installed / located correctly.
- Replace the NV media card.

Trip	Card Busy
Value	178
Short description	

An attempt has been made to access a file on a NV media card, but the file is already being accessed by an Option Module, such as one of the

Applications modules. No data is transferred.

Recommended actions:

- Wait for the Option Module to finish accessing the NV media card and re-attempt the required function.

Trip	<i>Card Compare</i>
Value	188
Short description	

A compare has been carried out between a file on a NV media card and the drive and these are different and no other NV media card related trips have occurred.

Recommended actions:

- Set Pr *mm.000* to 0 to reset the trip.
- Check to ensure the correct data block on the NV media card has been used for the compare.

Trip	<i>Card Data Exists</i>
Value	179
Short description	

An attempt has been made to store data on a NV media card, but the file already exists. No data is transferred. The file should be erased first to prevent this trip.

Recommended actions:

- Erase the data in data location.
- Write data to an alternative data location.

Trip	<i>Card Drive Mode</i>
Value	187
Short description	

This trip is produced during a compare if the drive mode in the file on the NV media card is different from the current drive mode and the file is a parameter file. This trip is also produced if an attempt is made to transfer a parameter file where the source and target drive modes are different and the drive mode is outside the range allowed for the target drive.

Recommended actions:

- Ensure the destination drive supports the drive operating mode in the parameter file.
- Clear the value in Pr *mm.000* and reset the drive.
- Ensure destination derive operating mode is the same as the source parameter file.

Trip	<i>Card Error</i>
Value	182
Short description	

An attempt has been made to access a NV media card, but an error has been detected in the data structure on the card. Resetting this trip will cause the drive to erase the <MCDF> folder from the NV media card (if it exists) and create the correct folder structure. On an SD card, whilst this trip is still present, missing directories will be created, and if the header file is missing it will be created. The following sub-trip numbers are used with this trip.

Sub-trip	Reason
1	The required folder and file structure is not present.
2	The <000> file is corrupted.
3	Two or more files in the <MCDF> folder have the same file identification number.

Recommended actions:

- Erase all the data block and re-attempt the process.
- Ensure the card is located correctly.
- Replace the NV media card.

Trip	<i>Card Full</i>
Value	184
Short description	

An attempt has been made to write to a NV media card, but there is insufficient space available. No data is transferred.

Recommended actions:

- Delete a data block or the entire NV media card to create space.
- Replace the NV media card.

Trip	Card No Data
Value	183
Short description	

An attempt has been made to access a non-existent file on a NV media card. No data is transferred.

Recommended actions:

- Ensure data block number is correct.

Trip	Card Option
Value	180
Short description	

A parameter file has been transferred from a NV media card to the drive, but at least one of the option modules are difference between source and target drives. This trip does not stop the data transfer, but is a warning that the data for the option modules that are different will be set to the default values and not the values from the card. This trip also applies if a compare is performed between a parameter file on a card and the drive and the option modules fitted are different between the source and target.

Recommended actions:

- Ensure the correct option modules are installed.
- Ensure the option modules are in the same option module slot as the parameter set stored.
- Press the red reset button to acknowledge that the parameters for one or more of the option modules installed will be at their default vaules.
- This trip can be suppressed by setting Pr *mm.000* to 9666 and resetting the drive.

Trip	Card Product
Value	175
Short description	

Product or derivative are incompatible between the source and target drives.

Sub-trip	Reason
1	If <i>Drive Derivative</i> (11.028) is different between the source and target drives. This trip is initiated either at power-up or when the SDcard is accessed. This trip can be reset and data can be transferred in either direction between the drive and the card.
2	If <i>Product Type</i> (11.063) is different between the source and target drives or the file is corrupted or incompatible. This trip is initiated either at power-up or when the SDcard is accessed. This trip can be reset but no data are transferred in either direction between the drive and the card.
3	Reserved

Recommended actions:

Sub-trip	Actions
1	<ul style="list-style-type: none"> • Use a different NV media card or choose a file compatible between the source and target drives. • This trip can be suppressed by setting Pr <i>mm.000</i> to 9666 and resetting the drive.
2	<ul style="list-style-type: none"> • Use a different NV media card or choose a file compatible between the source and target drives.

Trip	Card Rating
Value	186
Short description	

A parameter file has been transferred from a NV media card to the drive, but the current and/or voltage rating are different between source and target drive. This trip does not stop the data transfer, but is a warning that the data for rating dependent parameters may not be the same on the target as the source drive. This trip also applies if a compare (using Pr *mm.000* set to 8yyy) is performed between a parameter file on the card on the drive.

Recommended actions:

- Reset the drive to clear the trip.
- This trip can be suppressed by setting Pr *mm.000* to 9666 and resetting the drive.

Trip	Card Read Only
Value	181
Short description	

An attempt has been made to modify data on a read-only NV media card or to modify a read-only file (i.e. erase the card, erase a file or create a file). No data is transferred.

Recommended actions:

- Clear the read only flag by setting Pr *mm.000* to 9777 and reset the drive. This will clear the read only flag for all data blocks in the NV media card.

Trip	Card Slot
Value	174
Short description	

The transfer of an option module application program to or from an application module can fail because the option module does not respond correctly. If this happens this trip is produced with the sub-trip indicating the option module slot number.

Sub-trip number	Reason
1	Error in option slot 1

Recommended actions:

- Ensure the source / destination option module is installed on the correct slot.

Trip	Control Word
Value	35
Short description	

This trip is initiated by setting bit 12 on the control word in *Control Word (06.042)* when the control word is enabled (*Control Word Enable (06.043) = On*).

Recommended actions:

- Check the value of *Control Word (06.042)*.
- Disable the control word in *Control Word Enable (06.043)*.

Trip	Current Offset
Value	225
Short description	

The current feedback offset is too large to be trimmed correctly.

Recommended actions:

- Ensure that there is no possibility of current flowing in the output phase of the drive when the drive is not enabled.
- Hardware fault - contact the supplier of the drive.

Trip	Data Changing
Value	97
Short description	

A user action or a file system write is active that is changing the drive parameters and the drive has become active, i.e. *Drive Active (10.002) = 1*. The user actions that change drive parameters are loading defaults, changing drive mode, or transferring data from an NV memory card or a position feedback device to the drive. The file system actions that will cause this trip to be initiated if the drive is enabled during the transfer are writing a parameter or macro file to the drive, or transferring a derivative or user program to the drive. It should be noted that none of these actions can be started if the drive is active, and so the trip only occurs if the action is started and then the drive is enabled.

Recommended actions:

- Ensure the drive is not enabled when one of the following is being carried out:
 - Loading defaults
 - Transferring user programs

Trip	DCCT Ref
Value	110
Short description	

DCCT reference out of range for large frames only.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	Derivative ID
Value	246
Short description	

An error has been detected in the derivative product image. The sub-trip indicated the reason for the trip.

Sub-trip	Reason	Comments
1	The derivative image is missing or is invalid	Occurs when the drive powers-up. Load valid derivative image matching the control board hardware.
2	The derivative image does not match the control board hardware	Occurs when the drive powers-up. Load valid derivative image matching the control board hardware.
3	The derivative image has been changed for an image with a different derivative number.	Occurs when the drive powers-up or the image is programmed. The image tasks will not run.

Trip	<i>Derivative Image</i>
Value	248
Short description	

An error has been detected in the derivative product image. The sub-trip indicated the reason for the trip.

Sub-trip	Reason	Comments
1	Divide by zero	
2	Undefined trip	
3	Attempted fast parameter access set-up with non-existent parameter	
4	Attempted access to non-existent parameter	
5	Attempted write to read-only parameter	
6	Attempted and over-range write	
7	Attempted read from write-only parameter	
30	The image has failed because either its CRC is incorrect, or there are less than 6 bytes in the image or the image header version is less than 5.	Occurs when the drive powers-up or the image is programmed. The image tasks will not run.
31	The image requires more RAM for heap and stack than can be provided by the drive.	As 30.
32	The image requires an OS function call that is higher than the maximum allowed.	As 30.
33	The ID code within the image is not valid	As 30.
34	The derivative image has been changed for an image with a different derivative number.	As 30.
40	The timed task has not completed in time and has been suspended.	
41	Undefined function called, i.e. a function in the host system vector table that has not been assigned.	
51	Core menu customisation table CRC check failed	As 30.
52	Customisable menu table CRC check failed	As 30.
53	Customisable menu table changed	Occurs when the drive powers-up or the image is programmed and the table has changed. Defaults are loaded for the derivative menu and the trip will keep occurring until drive parameters are saved.

61	The option module fitted in slot 1 is not allowed with the derivative image.	As 30.
62	The option module fitted in slot 2 is not allowed with the derivative image.	As 30.
63	The option module fitted in slot 3 is not allowed with the derivative image.	As 30.
64	The option module fitted in slot 4 is not allowed with the derivative image.	As 30.
70	An option module that is required by the derivative image is not fitted in any slot.	As 30.
71	An option module specifically required to be fitted in slot 1 not present.	As 30.
72	An option module specifically required to be fitted in slot 2 not present.	As 30.
73	An option module specifically required to be fitted in slot 3 not present.	As 30.
74	An option module specifically required to be fitted in slot 4 not present.	As 30.
80	*Image is not compatible with the control board	Initiated from within the image code.
81	*Image is not compatible with the control board serial number	As 80.

Recommended actions:

- Contact the supplier of the drive.

Trip	Destination
Value	199
Short description	

This trip indicated that destination output parameters of two or more logic functions within the drive are writing to the same parameter.

Recommended actions:

- Set Pr *mm.000* to "Destinations" or 12001 and check all visible parameters in all menus for parameter write conflicts

Trip	Drive config
Value	232
Short description	

The power stage ID does not match the rating table ID

Sub-trip	Reason
1	The power stage ID does not match the rating table ID (Large frame only).
2	Invalid power stage ID.
3	The power stage ID does not match the rating table ID (Size A-D)

Recommended actions:

- Check the personality file matches the hardware

Trip	<i>EEPROM Fail</i>
Value	31
Short description	

This trip indicates that default parameters have been loaded because of the reasons given below.

Sub-trip	Reason
1	The most significant digit of the internal parameter database version number has changed.
2	The CRC's applied to the parameter data stored in internal non-volatile memory indicate that a valid set of parameters cannot be loaded.
3	The drive mode restored from internal non-volatile memory is outside the allowed range for the product or the derivative image does not allow the previous drive mode.
4	The drive derivative image has been changed and it has changed the customisation of the drive core menus.
5	The power stage hardware has been change and changed the customisation of the drive core menus.
6	Reserved
7	Reserved
8	The control board hardware has been change and changed the customisation of the drive core menus.
9	The checksum on the non-parameter area of the EEPROM has failed.

The drive holds two banks of user save parameters and two banks of power down save parameters in non-volatile memory. If the last bank of either set of parameters that was saved is corrupted a *User Save* or *Power Down Save* trip is produced. If one of these trips occurs the parameters values that were last saved successfully are used. It can take some time to save parameters when requested by the user and if the power is removed from the drive during this process it is possible to corrupt the data in the non-volatile memory.

If both banks of user save parameters or both banks of power down save parameters are corrupted or one of the other conditions given in the table above occurs *EEPROM Fail.xxx* trip is produced. If this trip occurs it is not possible to use the data that has been saved previously, and so the drive will be loaded with default parameters. The trip can only be reset if *Parameter mm.000* (mm.000) is set to 10, 11, 1233 or 1244 or if *Load Defaults* (11.043) is set to a non-zero value

Trip	<i>External Trip</i>
Value	6
Short description	

External trip is initiated as shown in the table below.

Sub-trip	Reason
3	<i>External Trip</i> (10.032) = 1

Recommended actions:

- Check the value of *External Trip* (10.032).
- Select "Destinations" (or enter 12001) in Pr *mm.000* and check for a parameter controlling *External Trip* (10.032).
- Ensure *External Trip* (10.032) or *User Trip* (10.038) (=6) is not being used by serial comms.

Trip	<i>Fan fail</i>
Value	173
Short description	

Fan failure

Recommended actions:

- Check that the fan is fitted and connected correctly.

- Contact the supplier of the drive to replace the fan.

Trip	File changed
Value	247
Short description	

Rating table changed

Recommended actions:

- Power cycle drive

Trip	FW incompatible
Value	237
Short description	

Firmware version between user board and power board does not match.

Trip	Hot Rect/Brake
Value	250
Short description	

Reserved trip number.

Trip	I cal. range
Value	231
Short description	

Current calibration range error.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	I/O Overload
Value	26
Short description	

This trip indicates that the total current drawn from the AI adaptor 24V or from the digital output has exceeded the limit.

Sub-trip	Reason
1	Digital output or 24V supply load on control terminal is too high.
2	AI adaptor 24V load is too high

Recommended actions:

- Check total loads on digital outputs and 24V.
- Check control wiring is correct.
- Check output wiring is undamaged

Trip	Keypad Mode
Value	34
Short description	

If keypad reference mode is enabled (*Reference Selected Indicator* (01.049) = 4 or 6) (i.e. *Reference Selector* (01.014) is set to 4 or 6 if motor map 1 is selected, or *M2 Reference Selector* (21.003) is set to 4 or 6 if motor map 2 is selected) and the keypad removed, then this trip is initiated.

Recommended actions:

- Re-install keypad and reset.
- Change *Reference Selector* (01.014) to select the reference from another source.

Trip	LF Power Comms
Value	90
Short description	

This trip is initiated if there is no communications between power, control or the rectifier module or if excessive communication errors have been detected. The reason for the trip can be identified by the sub-trip number.

Source	xx	y	zz
Control system	00	0	01: No communications between the control system and the power system.
Control system	00	0	02: Excessive communication errors between the control system and power system.
Control system	01	1	00: Excessive communications errors detected by the rectifier module.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	<i>Motor Too Hot</i>
Value	20
Short description	

This trip indicates a motor thermal overload based on the *Motor Rated Current* (05.007) and *Motor Thermal Time Constant 1* (04.015). *Motor Protection Accumulator* (04.019) displays the motor temperature as a percentage of the maximum value. The drive will trip on *Motor Too Hot* when *Motor Protection Accumulator* (04.019) gets to 100%.

Recommended actions:

- Ensure the load is not jammed / sticking.
- Check the load on the motor has not changed.
- Tune the *Motor Rated Speed* (05.008) (RFC-A mode only).
- Ensure the motor rated current is not zero.

Trip	<i>No power board</i>
Value	236
Short description	

Reserved trip number.

Trip	<i>None</i>
Value	0
Short description	

Trip	<i>Oht Control</i>
Value	219
Short description	

This trip indicates that a control stage over-temperature has been detected if *Cooling Fan control* (06.045) = 0.

This trip causes the option module to go to standby and *Potential Drive Damage Conditions* (10.106) bit 1 to be set.

Recommended actions:

- Increase ventilation by setting *Cooling Fan control* (06.045) > 0.

Trip	<i>Oht dc bus</i>
Value	27
Short description	

This trip indicates a DC bus component over temperature based on a firmware thermal model. The drive includes a thermal protection system to protect the DC bus components within the drive. This includes the effects of the output current and DC bus ripple. The estimated temperature is displayed as a percentage of the trip level in *Percentage Of d.c. Link Thermal Trip Level* (07.035). If this parameter reaches 100% then an *Oht dc bus* trip is initiated. The drive will attempt to stop the motor before tripping. If the motor does not stop in 10 seconds then the drive trips immediately.

Source	xx	y	zz
Control system	00	2	00: D.c. link thermal model gives <i>Oht dc bus</i> trip with sub-trip 0.

Recommended actions:

- Check the AC supply voltage balance and levels.
- Check the DC bus ripple level.

- Reduce duty cycle.
- Reduce motor load.
- Check output current stability. If unstable;
 - Check the motor map settings with motor nameplate (*Motor Rated Frequency* (05.006), *Motor Rated Current* (05.007), *Motor Rated Speed* (05.008), *Motor Rated Voltage* (05.009), *Motor Rated Power Factor* (05.010) and *Number Of Motor Poles* (05.011))
 - Disable slip compensation (*Slip Compensation Level* (05.027) = 0.0%)
 - Disable dynamic V to F operation (*Flux Optimisation Select, Dynamic V To F Select* (05.013) = Off (0))
 - Select fixed boost (*Control Mode* (05.014) = Fixed (2))
 - Select high stability space vector modulation (*High Stability Space Vector Modulation* (05.019) = On (1))
 - Disconnect the load and complete a rotating auto-tune (*Auto-tune* (05.012) = 2)
 - Reduce frequency loop gains (*Frequency Controller Proportional Gain Kp1* (03.010), *Frequency Controller Integral Gain Ki1* (03.011) and *Frequency Controller Differential Feedback Gain Kd1* (03.012))
 - Add a current demand filter (*Current Reference Filter 1 Time Constant* (04.012))

Trip	<i>Oht Inverter</i>
Value	21
Short description	

This trip indicates that an IGBT junction over-temperature has been detected based on a firmware thermal model.

Source	xx	y	zz
Control system	00	1	00: Inverter thermal model gives <i>Oht Inverter</i> trip with sub-trip 0.

Recommended actions:

- Reduce the selected drive switching frequency.
- Ensure *Auto-switching Frequency Change Disable* (05.035) is set to Off.
- Reduce duty cycle.
- Decrease acceleration / deceleration rates.
- Reduce motor load.
- Check DC bus ripple.
- Ensure all three input phases are present and balanced

Trip	<i>Oht Power</i>
Value	22
Short description	

This trip indicates that a power stage over-temperature has been detected. From the sub-trip "xyzz", the thermistor location is identified by "zz".

Source	xx	y	zz
Power system	01	0	zz: Thermistor location defined by zz in the power system gives <i>Oht Power</i> trip with sub-trip xx0zz.

Recommended actions:

- Check enclosure / drive fans are still functioning correctly.
- Force the heatsink fans to run at maximum speed.
- Check enclosure ventilation paths.
- Check enclosure door filters.
- Increase ventilation.
- Reduce duty cycle.
- Decrease acceleration / deceleration rates.
- Reduce motor loads.
- Check the derating tables and confirm the drive is correctly sized for the application.
- Use a drive with larger current / power rating.

Trip	<i>OI ac</i>
Value	3
Short description	

This trip indicates that the instantaneous drive output current has exceeded the drive over current threshold.

Source	xx	y	zz
Control system	00	0	00: Instantaneous over-current trip when the measured a.c. current exceeds the over current threshold.

The over current threshold is the maximum current the drive can measure and is defined by VM_DRIVE_CURRENT[MAX]

Recommended actions:

- Acceleration / deceleration rate is too short.

- If seen during auto-tune reduce the voltage boost.
- Check for short circuit on the output cabling.
- Check integrity of the motor insulation using a Megger.
- Check motor cable is within limits for the frame size.
- Reduce frequency loop gains (*Frequency Controller Proportional Gain Kp1* (03.010), *Frequency Controller Integral Gain Ki1* (03.011) and *Frequency Controller Differential Feedback Gain Kd1* (03.012))
- Reduce the current loop gains.

Trip	OI Brake
Value	4
Short description	

This trip indicates that an over-current has been detected in braking IGBT or braking IGBT protection has been activated.

Source	xx	y	zz
Power system	01	0	00: Braking IGBT instantaneous over-current trip

Recommended actions:

- Check brake resistor wiring.
- Check braking resistor value is greater than or equal to the minimum resistance value.
- Check braking resistor insulation.

Trip	OI Snubber
Value	92
Short description	

This trip indicates that an over-current condition has been detected in the rectifier snubbing circuit, The exact cause of the trip can be identified by the sub-trip number.

Source	xx	y	zz
Power system	01	1	00: Rectifier snubber over-current trip detected.

Recommended actions:

- Ensure the internal EMC filter is installed.
- Ensure the motor cable length does not exceed the maximum for selected switching frequency.
- Check for supply voltage imbalance.
- Check for supply disturbance such as notching from a DC drive.
- Check the motor and motor cable insulation with a Megger.
- Fit an output line reactor or sinusoidal filter

Trip	Out Phase Loss
Value	98
Short description	

Output phase loss detected. A test can be made for output phase loss when the drive is enabled or the output phase loss condition can be detected while the drive is running as defined by *Output Phase Loss Detection Enable* (06.059).

Sub-trip	Reason
1	Phase U is not connected when drive is enabled
2	Phase V is not connected when drive is enabled
3	Phase W is not connected when drive is enabled
4	The drive output frequency is above 4Hz and a phase is disconnected for the time specified by <i>Output Phase Loss Detection Time</i> (06.058)

Recommended actions:

- Check motor and drive connections.
- To disable the trip set *Output Phase Loss Detection Enable* (06.059) to Off.

Trip	Output phase s/c
Value	228
Short description	

Output phase short circuit.

Recommended actions:

- Check motor and connection to motor

Trip	Over Speed
Value	7
Short description	

If the *Output Frequency* (05.001) exceeds the threshold set in *Over Frequency Threshold* (03.008) in either direction, a *Reserved* trip is produced.

If *Over Frequency Threshold* (03.008) is set to 0.0 the threshold is based on the variable minimum/maximum for the references and is equal to $1.2 \times VM_SPEED_FREQ_REF[MAX]$.

Recommended actions:

- Reduce the *Frequency Controller Proportional Gain Kp1* (03.010) to reduce the frequency overshoot.

Trip	Over Volts
Value	2
Short description	

This trip indicates the the DC bus voltage has exceeded $VM_DC_VOLTAGE[MAX]$ instantaneously or $VM_DC_VOLTAGE_SET[MAX]$ for 15s. The trip threshold varies depending on voltage rating of the drive as shows below.

Voltage rating	$VM_DC_VOLTAGE[MAX]$	$VM_DC_VOLTAGE_SET[MAX]$
200	415	410
400	830	815
575	990	970

The exact cause of the trip can be identified by the sub-trip number.

Source	xx	y	zz
Control system	00	0	01: Instantaneous trip when the d.c. link voltage exceeds $VM_DC_VOLTAGE[MAX]$.
Control system	00	0	02: Time delayed trip indicating that the d.c. link voltage is above $VM_DC_VOLTAGE_SET[MAX]$.
Power system	01	0	00: Instantaneous trip when the d.c. link voltage exceeds $VM_DC_VOLTAGE[MAX]$.

Recommended actions:

- Increase deceleration ramp.
- Decrease the braking resistor value (staying above the minimum value).
- Check nominal AC supply level.
- Check for supply disturbances which could cause the DC bus level to rise.
- Check motor insulation using a Megger.

Trip	Phase Loss
Value	32
Short description	

This trip indicates that the drive has detected an input phase loss or large supply imbalance. The drive will attempt to stop the motor before the trip is initiated. If the motor cannot be stopped in 10 seconds the trip occurs immediately. This trip works by monitoring the ripple voltage on the DC bus of the drive, if the DC buss ripple exceeds the threshold, the drive will trip on *Phase Loss*. Potential causes of the DC bus ripple are input phase loss, large supply impedance and severe output current instability.

Source	xx	y	zz
Control system	00	0	00: Phase loss detected based on control system feedback. The drive attempts to stop the drive before tripping unless bit 2 of <i>Action On Trip Detection</i> (10.037) is set to one.
Power system	01	0	00: Phase loss has been detected by the rectifier module.
Control system	01	1	01: Supply loss has been detected by the rectifier module in a multi-power module system, where this must be treated as a phase loss condition to prevent damage to the drive.

Input phase loss detection can be disabled when the drive required to operate from the DC supply or from a single phase supply in *Input Phase Loss Detection Mode* (06.047).

Recommended actions:

- Check the AC supply voltage balance and level at full load.
- Check the DC bus ripple level with an isolated oscilloscope.
- Check the output current stability.
- Reduce the duty cycle.

- Reduce the motor load.
- Disable the phase loss detection by setting *Input Phase Loss Detection Mode* (06.047) to Disabled.

Trip	Power Board HF
Value	235
Short description	

Reserved trip number.

Trip	Power Boot Mode
Value	245
Short description	

Power board is in its bootloader

Recommended actions:

- Send power board firmware file to reprogram the power board and power cycle drive.

Trip	Power Comms
Value	93
Short description	

Communication between the flavour and the olympian power board was lost. The exact cause of the trip can be identified by the sub-trip number.

Sub-trip number	Reason
1	PLL operating region out of lock
2	Power board lost communication with user board
3	User board lost communication with power board
4	Communication CRC error

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	Power Data
Value	220
Short description	

This trip can be generated either from the drive control system or from the power system.

This trip is produced if there is an error in the configuration data stored in the power system. If the source of the trip is the control system then the trip related to the table that is uploaded from the power system at power-up.

Source	xx	y	zz
Control system	00	0	01: No data was obtained because this was skipped.
Control system	00	0	02: There is no data table in node 1.
Control system	00	0	03: The power system data table is bigger than the space available in the control pod to store it.
Control system	00	0	04: The size of the table given in the table is incorrect
Control system	00	0	05: Table CRC error.
Control system	00	0	06: The version number of the generator software that produced the table is too low, i.e. a table from a newer generator is required that includes features that have been added to the table that may not be present.
Control system	00	0	07: The power data table failed to be stored in the power board.
Power system	01	0	00: The power data table used internally by the power module has an error.
Power system	01	0	01: The power data table that is uploaded to the control system on power up has an error.
Power system	01	0	02: The power data table used internally by the power module does not match the hardware identification of the power module.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	Power Down Save
Value	37
Short description	

This trip indicates that an error has been detected in the power down save parameters stored in non-volatile memory.

Recommended actions:

- Perform a 1001 save in Pr *mm.000* to ensure that the trip doesn't occur the next time the drive is powered up.

Trip	PSU
Value	5
Short description	

This trip indicates that one or more internal power supply rails are outside limits or overloaded.

Source	xx	y	zz
Control system	00	0	00: Internal power supply overload
Power system	01	1	00: Internal power supply overload

Recommended actions:

- Remove any option modules and perform a reset.
- Hardware fault within the drive - return the drive to the supplier.

Trip	Reserved
Value	1
Short description	

The under voltage condition is now a drive state, and so this trip is no longer used by the drive.

Trip	Reset
Value	100
Short description	

This is not a valid trip number as this value is used in *User Trip* (10.038) to reset the drive.

Trip	Reset Logs
Value	255
Short description	

This is not a valid trip number as this value is used in *User Trip* (10.038) to reset the trip logs.

Trip	Resistance
Value	33
Short description	

During auto-tune it is possible to attempt to measure the resistance of the motor connected to the drive. If the measured value or a value written to this parameter by the user exceeds $(V_{FS} / \sqrt{2}) / \text{Full Scale Current } Kc$ (11.061), where V_{FS} is the full scale d.c. link voltage then this trip is initiated.

Recommended actions:

- Check the motor cable / connections.
- Check the integrity of the motor stator winding using an insulation tester.
- Check the motor phase to phase resistance at the drive terminals.
- Check the motor phase to phase resistance at the motor terminals.
- Ensure the stator resistance of the motor falls within the range of the drive model.
- Select fixed boost mode (*Control Mode* (05.014) = Fixed) and verify the output current waveforms with an oscilloscope.
- Replace the motor.

Trip	Slot1 Different
Value	204
Short description	

If the option module fitted in option slot 1 is different to the option module present at the last power-down then this trip is produced. The sub-trip number gives the identification code of the module that was originally fitted. Drive user parameters must be saved to prevent this trip on the next power-up if the module has changed. If the menus have been changed, but not the module, the trip will not occur on the next power-up. The sub-trip number gives the following indications of the reason for the trip.

Sub-trip	Reason
1	No module was fitted previously
2	A module with the same identifier is fitted, but the set-up menu for this option slot has been changed, and so default parameters have been loaded for this menu.
3	A module with the same identifier is fitted, but the applications menu for this option slot has been changed, and so default parameters have been loaded for this menu.
4	A module with the same identifier is fitted, but the set-up and applications menu for this option slot have been changed, and so default parameters have been loaded for these menus.
>99	Shows the identifier of the module previously fitted.

Recommended actions:

- Turn off the power, ensure the correct option modules are installed in the correct option slots and re-apply the power.
- Confirm that the currently installed option module is correct, ensure option module parameters are set correctly and perform a user save in *Pr mm.000*.

Trip	Slot1 Error
Value	202
Short description	

The option module in option slot 1 has indicated an error. The option module can give the reason for the error and this is shown in the sub-trip number. As default the sub-trip number is shown as a number on the display, however, it is possible for the option module to supply sub-trip number strings which will be displayed instead of the number if available.

Recommended actions:

- See relevant *Option Module User Guide* for details of the trip.

Trip	Slot1 HF
Value	200
Short description	

This trip indicates that there is a fault with the option module in option slot 1 that means that this module cannot operate. The possible causes of the trip are given by the sub-trip value.

Sub-trip	Reason
1	The module category cannot be identified
2	All the required customisable menu table information has not been supplied or the tables supplied are corrupt
3	There is insufficient memory available to allocate the comms buffers for this module.
4	The module has not indicated that it is running correctly during drive power-up
5	The module has been removed after power-up or it has ceased to indicate to the drive processor that it is still active.
6	The module has not indicated that it has stopped accessing drive parameters during a drive mode change
7	The module has failed to acknowledge that a request has been made to reset the drive processor.
8	The drive failed to read correctly the menu table from the module during drive power-up.
9	The drive failed to upload menu tables from the module and timed-out (5s).
10	Menu table CRC invalid.

Recommended actions:

- Ensure the option module is installed correctly.
- Replace the option module.
- Replace the drive.

Trip	<i>Slot1 Not Fitted</i>
Value	203
Short description	

Each option module fitted in the drive is identified at power-up and the option fitted is stored by the drive in its non-volatile memory. If an option module was fitted in slot 1 at power-down, but that option module has subsequently been removed before power up then this trip is produced. The sub-trip number gives the identification code of the option module that has been removed. Drive user parameters must be saved to prevent this trip on the next power-up.

Recommended actions:

- Ensure the option module is installed correctly.
- Re-install the option module.
- To confirm that the removed option module is no longer required perform a save function in Pr *mm.000*.

Trip	<i>Slot1 Watchdog</i>
Value	201
Short description	

This trip indicates that the option module in option slot 1 has started the option watchdog function and then failed to service this watchdog correctly.

Recommended actions:

- Replace the option module.

Trip	<i>Soft Start</i>
Value	226
Short description	

This trip indicates that the soft start system has remained active when it should be inactive. For a resistor based soft start this means that the soft start shorting relay has not closed.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	<i>STO error</i>
Value	234
Short description	

STO board not fitted.

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	Stored HF
Value	221
Short description	

If an HF01 to HF17 trip occurs then a *Stored HF* trip occurs each time the drive is powered up until this trip is reset. The sub-trip code is the number of the original HF trip. The *Stored HF* trip can only be reset by first writing 1299 to Pr *mm.000* and resetting the drive.

Recommended actions:

- Enter 1299 into Pr *mm.000* and press reset to clear the trip.

Trip	Sub-array RAM
Value	227
Short description	

An option module, derivative image or user program image has requested more parameter RAM than is allowed. The RAM allocation is checked in order of resulting sub-trip numbers, and so the failure with the highest sub-trip number is given. The sub-trip is calculated as (parameter size x 1000) + (parameter type x 100) + sub-array number. Note that if this trip occurs, all menu customisation provided by option modules, the derivative image or the user program image is not used. The tables below show the values corresponding to the parts of the sub-trip number.

Parameter size	Value
1 bit	1
8 bit	2
16 bit	3
32 bit	4
64 bit	5

Parameter type	Value
Volatile	0
User save	1
Power-down save	2

Derivatives can customise menus 18 and 20.

Sub-array	Menus	Value
Applications menus	18-20	1
Derivative image	29	2
User program image	30	3
Option slot 1 set-up	15	4
Option slot 1 applications	25	5

Trip	<i>Temp Feedback</i>
Value	218
Short description	

This trip indicates a fault with a thermistor in the drive (i.e. open circuit or short circuit).

Source	xx	y	zz
Power system	01	0	zz: Thermistor location defined by zz in the power system
Power system	01	1	zz: Thermistor location defined by zz in the rectifier

Recommended actions:

- Hardware fault - contact the supplier of the drive.

Trip	<i>Th Brake Res</i>
Value	10
Short description	

If hardware based braking resistor thermal monitoring is provided and the resistor overheats this trip is initiated. If the braking resistor is not present then this trip must be disabled with bit 3 of *Action On Trip Detection* (10.037) to prevent this trip.

Recommended actions:

- Check braking resistor wiring.
- Check braking resistor value is greater than or equal to the minimum resistance value.
- Check braking resistor insulation.

Trip	<i>Th Short Circuit</i>
Value	25
Short description	

This trip indicates that the motor thermistor is short circuited or has a low impedance.

Digital input 5 mode (08.035) and the resistance of the thermistor connected to DI 5 is less than 50Ω.

Recommended actions:

- Check thermistor continuity.
- Replace motor / motor thermistor

Trip	<i>Thermistor</i>
Value	24
Short description	

This trip indicates that the motor thermistor has indicated a motor over-temperature.

If *Digital input 5 mode* (08.035) is 2 then a *Thermistor* trip is initiated if the feedback value is higher than *Thermistor Trip Threshold* (07.048).

Recommended actions:

- Check motor temperature.
- Check thermistor continuity.

Trip	<i>User OI ac</i>
Value	8
Short description	

Reserved trip number.

Trip	<i>User Prog Trip</i>
Value	96
Short description	

This trip can be initiated from within an onboard user program using a function call which defines the sub-trip number.

Recommended actions:

- Check the user program

Trip	<i>User Program</i>
Value	249
Short description	

An error has been detected in the onboard user program image. The sub-trip indicated the reason for the trip.

Sub-trip	Reason	Comments
1	Divide by zero	
2	Undefined trip	
3	Attempted fast parameter access set-up with non-existent parameter	
4	Attempted access to non-existent parameter	
5	Attempted write to read-only parameter	
6	Attempted an over-range write	
7	Attempted read from write-only parameter	
30	The image has failed because either its CRC is incorrect, or there are less than 6 bytes in the image or the image header version is less than 5.	Occurs when the drive powers-up or the image is programmed. The image tasks will not run.
31	The image requires more RAM for heap and stack than can be provided by the drive.	As 30.
32	The image requires an OS function call that is higher than the maximum allowed.	As 30.
33	The ID code within the image is not valid	As 30.
34	The user program image has been changed for an image with a different user program number.	As 30.
40	The timed task has not completed in time and has been suspended.	<i>Onboard User Program: Enable (11.047)</i> is reset to zero when the trip is initiated.
41	Undefined function called, i.e. a function in the host system vector table that has not been assigned.	As 40.
52	Customisable menu table CRC check failed	As 30.
53	Customisable menu table changed	Occurs when the drive powers-up or the image is programmed and the table has changed. Defaults are loaded for the user program menu and the trip will keep occurring until drive parameters are saved.
80	*Image is not compatible with the control board	Initiated from within the image code.
81	*Image is not compatible with the control board serial number	As 80.

100	Image has detected and prevented attempted pointer access outside of the IEC task's heap area.	
101	Image has detected and prevented misaligned pointer usage.	
102	Image has detected an array bounds violation and prevented its access.	
103	Image has attempted to convert a data type to or from an unknown data type, has failed and has shut itself down.	
104	Image has attempted to use an unknown user service function.	
200	User program has invoked a "divide" service with a denominator of zero. (Note that this is raised by the downloaded image and has therefore been given a distinct error code despite being the same fundamental problem as sub-trip 1.)	
201	Parameter access is not supported. An attempt to read database other than the host drive.	
202	Parameter does not exist. Database was host drive but the specified parameter does not exist.	
203	Parameter is read-only.	
204	Parameter is write-only.	
205	Unknown parameter error.	
206	Invalid bit present in parameter. The parameter does not contain the specified bit.	
207	Parameter format lookup failed. Failed to get parameter information data.	
208	An over-range write has been attempted.	

The following table gives the differences when compared to the derivative product image.

Sub-trip	Difference
40, 41	<i>Onboard User Program: Enable</i> (11.047) is reset to zero when the trip is initiated.
51	Not applicable as core menu customisation not allowed
6x	Not applicable as option module restrictions not allowed
7x	Not applicable as option module restrictions not allowed
100	Image has detected and prevented attempted pointer access outside of the IEC task's heap area.
101	Image has detected and prevented misaligned pointer usage.
102	Image has detected an array bounds violation and prevented its access.
103	Image has attempted to convert a data type to or from an unknown data type, has failed and has shut itself down.
104	Image has attempted to use an unknown user service function.
200	User program has invoked a "divide" service with a denominator of zero. (Note that this is raised by the downloaded image and has therefore been given a distinct error code despite being the same fundamental problem as sub-trip 1.)

Trip	User Save
Value	36
Short description	

This trip indicates that an error has been detected in the user save parameters saved in non-volatile memory. For example, following a user save command, if the power to the drive was removed when the user parameters were being saved.

Recommended actions:

- Perform a user save in Pr *mm.000* to ensure that the trip doesn't occur the next time the drive is powered up.
- Ensure that the drive has enough time to complete the save before removing the power to the drive.

Trip	User Trip 40
