Low Voltage Alternator - 4 pole
Installation and maintenance
This manual concerns the alternator which you have just purchased. We wish to draw your attention to the contents of this maintenance manual.

SAFETY MEASURES
Before using your machine for the first time, it is important to read the whole of this installation and maintenance manual.

All necessary operations and interventions on this machine must be performed by a qualified technician.

Our technical support service will be pleased to provide any additional information you may require.

The various operations described in this manual are accompanied by recommendations or symbols to alert the user to potential risks of accidents. It is vital that you understand and take notice of the following warning symbols.

a) During operation, do not allow anyone to stand in front of the air outlet guards, in case anything is ejected from them.

b) Do not allow children younger than 14 to go near the air outlet guards.

A set of self-adhesive stickers depicting the various warning symbols is included with this maintenance manual. They should be positioned as shown in the drawing below once the machine has been fully installed.

WARNING
The alternators must not be put into service until the machines in which they are to be incorporated have been declared compliant with EC Directives plus any other directives that may be applicable.

This manual is to be given to the end user.

The range of electric alternators and their derivatives, manufactured by us or on our behalf, comply with the technical requirements of the customs Union directives (EAC).

© - We reserve the right to modify the characteristics of this product at any time in order to incorporate the latest technological developments. The information contained in this document may therefore be changed without notice.

This document may not be reproduced in any form without prior authorisation. All brands and models have been registered and patents applied for.

Disposal and recycling instructions

EC Declaration of compliance and incorporation
1 - RECEIPT

1.1 - Standards and safety measures
Our alternators comply with most international standards. See the EC Declaration of Incorporation on the last page.

1.2 - Inspection
On receipt of your alternator, check that it has not suffered any damage in transit. If there are obvious signs of knocks, contact the transporter (you may be able to claim on their insurance) and after a visual check, turn the machine by hand to detect any malfunction.

1.3 - Identification
The alternator is identified by means of a nameplate fixed on the machine (see drawing). Make sure that the nameplate on the machine conforms to your order. So that you can identify your alternator quickly and accurately, we suggest you fill in its specifications on the nameplate below.

1.4 - Storage
Prior to commissioning, machines should be stored:
- away from humidity (< 90%); after a long period of storage, check the machine insulation. To prevent the bearings from becoming marked, do not store in an environment with significant vibration.

1.5 - Application
This alternator is mainly designed to produce electricity in the context of applications involving the use of generators.

1.6 - Usage restrictions
Use of the machine is restricted to operating conditions (environment, speed, voltage, power, etc) compatible with the characteristics indicated on the nameplate.
2 - TECHNICAL CHARACTERISTICS

2.1 - Electrical characteristics
This alternator is a machine without sliprings or revolving armature brushes, wound as “2/3 pitch”, 6 or 12-wire, with class H insulation and a field excitation system available in either SHUNT, AREP or PMG version (see diagrams and AVR manuals). The alternator complies with EN 61000-6-3, EN 61000-6-2, EN 55011.

- Electrical options
  - Stator temperature detection sensors
  - Bearing sensors (PTC, PT100, etc)
  - Space heater
  - R791 interference suppression

- SHUNT three-phase 12-wire

- AREP three-phase 6 or 12-wire

- PMG three-phase 6 or 12-wire

2.2 - Mechanical characteristics
- Steel frame
- Cast iron end shields
- Protected ball bearings, greased for life
- Mounting arrangements: foot and flange mounted, single-bearing with SAE coupling disc, double-bearing with SAE flange and standard cylindrical shaft extension
- Drip-proof machine, self-cooled
- Degree of protection: IP 23

- Mechanical options
  - Air inlet filter
  - Regreaseable ball bearings
  - IP 44 protection
3 - INSTALLATION
Personnel undertaking the various operations indicated in this section must wear personal protective equipment appropriate for mechanical and electrical hazards.

3.1 - Assembly

All mechanical handling operations must be undertaken using suitable equipment and the machine must be horizontal. Check how much the machine weighs before choosing the lifting tool. During this operation, do not allow anyone to stand under the load.

• Handling

The generously-sized lifting eyes are for handling the alternator only. They must not be used to lift the genset. The choice of lifting hooks or handles should be determined by the shape of the lifting eyes. Choose a lifting system which respects the integrity and the environment of the machine.

During this operation, do not allow anyone to stand under the load.

• Single-bearing coupling

Before coupling, check the compatibility between the alternator and the engine by performing:
- undertaking a torsional analysis of the transmission (alternators data are available on request),
- checking the dimensions of the flywheel and its housing, the flange, coupling discs and offset.

WARNING

When coupling the alternator to the prime mover, do not use the fan to turn the alternator or rotor. The holes of the coupling discs should be aligned with the flywheel holes by cranking the engine. Make sure the machine is securely bedded in position during coupling.

Check that there is lateral play on the crankshaft.

• Double-bearing coupling

- Semi-flexible coupling

Careful alignment of the machines is recommended, checking that the lack of concentricity and parallelism of both parts of the coupling do not exceed 0.1 mm.

This alternator has been balanced with a 1/2 key.

• Location

The location where the alternator is placed must be ventilated to ensure that the ambient temperature cannot exceed the data on the nameplate.

3.2 - Checks prior to first use

• Electrical checks

Under no circumstances should an alternator, new or otherwise, be operated if the insulation is less than 1 megohm for the stator and 100,000 ohms for the other windings.
There are 2 possible methods for restoring the above minimum values.

a) Dry out the machine for 24 hours in a drying oven at a temperature of 110 °C (without the regulator).

b) Blow hot air into the air intake, having made sure that the machine is rotating with the exciter field disconnected.

**Note : Prolonged standstill**

In order to avoid these problems, we recommend the use of space heaters, as well as turning over the machine from time to time. Space heaters are only really effective if they are working continuously while the machine is stopped.

**WARNING**

Ensure that the alternator has the degree of protection matching the defined environmental conditions.

- **Mechanical checks**

Before starting the machine for the first time, check that:
- all fixing bolts are tight,
- the length of bolt and the tightening torque are correct,
- the cooling air is drawn in freely,
- the protective grille and housing are correctly in place,
- the standard direction of rotation is clockwise as seen from the drive end (phase rotation in order 1 - 2 - 3).

For anti-clockwise rotation, swap 2 and 3.
- the winding connection corresponds to the site operating voltage (see section 3.3).

---

**3.3 - Terminal connection diagrams**

To modify the connection, change the position of the stator cables on the terminals. The winding code is specified on the nameplate.

Any intervention on the alternator terminals during reconnection or checks should be performed with the machine stopped. In no case should the internal connections in the terminal box be subjected to stresses due to cables connected by the user.

• Connection checks

Electrical installations must comply with the current legislation in force in the country of use.
Check that:
- The residual circuit-breaker conforms to legislation on protection of personnel, in force in the country of use, and has been correctly installed on the alternator power output as close as possible to the alternator. (In this case, disconnect the wire of the interference suppression module linking the neutral).
- Any protection devices in place have not been tripped.
- If there is an external AVR, the connections between the alternator and the cabinet are made in accordance with the connection diagram.
- There is no short-circuit phase-phase or phase-neutral between the alternator output terminals and the generator set control cabinet (part of the circuit not protected by circuitbreakers or relays in the cabinet).
- The machine should be connected with the busbar separating the terminals as shown in the terminal connection diagram.

- The alternator earth terminal inside the terminal box is connected to the electrical earth circuit
- The earth terminal is connected to the frame.
The connections inside the terminal box must never be subjected to stress due to cables connected by the user.

3.4 - Commissioning

The machine can only be started up and used if the installation is in accordance with the regulations and instructions defined in this manual.

The machine is tested and set up at the factory. When first used with no load, make sure that the drive speed is correct and stable (see the nameplate). With the regreaseable bearing option, we recommend greasing the bearings at the time of commissioning (see section 4.3). On application of the load, the machine should achieve its rated speed and voltage; however, in the event of abnormal operation, the machine setting can be altered (follow the adjustment procedure in section 3.5). If the machine still operates incorrectly, the cause of the malfunction must be located (see section 4.5).

3.5 - Setting up

The various adjustments during tests must be made by a qualified engineer. Ensure that the drive speed specified on the nameplate is reached before commencing adjustment. After operational testing, replace all access panels or covers. The AVR is used to make any adjustments to the machine.
4 - SERVICING - MAINTENANCE

4.1 - Safety measures
Servicing or troubleshooting must be carried out strictly in accordance with instructions so as to avoid the risk of accidents and to maintain the machine in its original state.

All such operations performed on the alternator should be undertaken by personnel trained in the commissioning, servicing and maintenance of electrical and mechanical components, who must wear personal protective equipment appropriate for mechanical and electrical hazards.

Before any intervention on the machine, ensure that it cannot be started by a manual or automatic system and that you have understood the operating principles of the system.

Warning : During and after running, the alternator will reach temperatures hot enough to cause injury, such as burns.

4.2 - Routine maintenance

• Checks after start-up
After approximately 20 hours of operation, check that all fixing bolts on the machine are still tight, plus the general state of the machine and the various electrical connections in the installation.

• Electrical servicing
Commercially-available volatile degreasing agents can be used.

WARNING

Do not use: trichlorethylene, perchloroethylene, trichloroethane or any alkaline products.

These operations must be performed at a cleaning station, equipped with a vacuum system that collects and flushes out the products used.

The insulating components and the impregnation system are not at risk of damage from solvents. Avoid letting the cleaning product run into the slots. Apply the product with a brush, sponging frequently to avoid accumulation in the housing. Dry the winding with a dry cloth. Let any traces evaporate before reassembling the machine.

• Mechanical servicing

Cleaning the machine using water or a highpressure washer is strictly prohibited. Any problems arising from such treatment are not covered by our warranty.

Degreasing: Use a brush and detergent (suitable for paintwork).
Dusting: Use an air gun.
If the machine is fitted with air inlet and outlet filters, the maintenance personnel should clean them routinely at regular intervals. In the case of dry dust, the filter can be cleaned using compressed air and/or replaced if it is clogged.
After cleaning the alternator, it is essential to check the winding insulation (see sections 3.2 and 4.5).
4.3 - Bearings

<table>
<thead>
<tr>
<th>The bearings are permanently greased</th>
<th>Approximate life of the grease (depending on use) = 20,000 hours or 3 years.</th>
</tr>
</thead>
</table>
| As an option, the bearings are regreasable | Regreasing interval: 4000 hrs of operation  
DE bearing: Amount of grease: 33 gr  
NDE bearing: Amount of grease: 30 gr |
| Standard grease | LITHIUM - standard - NLGI 3 |
| Grease used in the factory | ESSO - Unirex N3 |

It is imperative to lubricate the alternator during operation and on first use. Before using another grease, check for compatibility with the original one.

4.4 - Mechanical defects

<table>
<thead>
<tr>
<th>Fault</th>
<th>Action</th>
</tr>
</thead>
</table>
| Bearing | Excessive overheating of one or both bearings (bearing temperature 80°C above the ambient temperature)  
- If the bearing has turned blue or if the grease has turned black, change the bearing.  
- Bearing not fully locked (abnormal play in the bearing cage)  
- End shields incorrectly aligned |
| Abnormal temperature | Excessive overheating of alternator frame (more than 40°C above the ambient temperature)  
- Air flow (inlet-outlet) partially clogged or hot air is being recycled from the alternator or engine  
- Alternator operating at too high a voltage (>105% of Un on load)  
- Alternator overloaded |
| Vibrations | Too much vibration  
- Misalignment (coupling)  
- Defective mounting or play in coupling  
- Rotor balancing fault (Engine - Alternator) |
| Excessive vibration and humming noise coming from the machine | - Phase imbalance  
- Stator short-circuit |
| Abnormal noise | Alternator damaged by a significant impact, followed by humming and vibration  
- System short-circuit  
- Misper paralleling  
Possible consequences  
- Broken or damaged coupling  
- Broken or bent shaft end  
- Shifting and short-circuit of main field  
- Fan fractured or coming loose on shaft  
- Irreparable damage to rotating diodes/AVR, surge suppressor |
## 4.5 - Electrical faults

</tbody>
</table>
**LSA 46.3**
Low Voltage Alternator - 4 pole

- **Checking the winding**
You can check the winding insulation by performing a high voltage test. In this case, you must disconnect all AVR wires.

**WARNING**
Damage caused to the AVR in such conditions is not covered by our warranty.

- **Checking the diode bridge**
A diode in good working order should allow the current to flow only in the anode-to-cathode direction.

- **Checking the windings and rotating diodes using separate excitation**
During this procedure, make sure that the alternator is disconnected from any external load and inspect the terminal box to check that the connections are fully tightened.

1) Stop the unit, disconnect and isolate the AVR wires.

2) There are two ways of creating an assembly with separate excitation.

**Assembly A:** Connect a 12 V battery in series with a rheostat of approximately 50 ohms - 300 W and a diode on both exciter field wires (5+) and (6-).

**ASSEMBLY A**

- **Assembly B:** Connect a “Variac” variable power supply and a diode bridge on both exciter field wires (5+) and (6-).

Both these systems should have characteristics which are compatible with the field excitation power of the machine (see the nameplate).

3) Run the unit at its rated speed.

4) Gradually increase the exciter field current by adjusting the rheostat or the variac and measure the output voltages on L1 - L2 - L3, checking the excitation voltage and current at no load (see the machine nameplate or ask for the factory test report). When the output voltage is at its rated value and balanced within 1% for the rated excitation level, the machine is in good working order. The fault therefore comes from the AVR or its associated wiring (i.e. sensing, auxiliary windings).
4.6 - Dismantling, reassembly

**WARNING**

During the warranty period, this operation should only be carried out in an approved workshop or in our factory, otherwise the warranty may be invalidated.

Whilst being handled, the machine should remain horizontal (rotor not locked in position). Check how much the machine weighs before choosing the lifting method.

- **Tools required**

To fully dismantle the machine, we recommend using the tools listed below:
- 1 ratchet spanner + extension
- 1 torque wrench
- 1 set of flat spanners: 8 mm, 10 mm, 18 mm
- 1 socket set: 8, 10, 13, 16, 18, 21, 24, 30 mm
- 1 socket with male ferrule: 5 mm
- 1 puller

- **Screw tightening torque**

See section 5.4.

- **Access to diodes**

  - Open the air intake grille (51).
  - Disconnect the diodes.
  - Check the 6 diodes, change the diode bridges if necessary.

- **Access to connections and the regulation system**

Access directly by removing the top of the cover (48) or the AVR access door (59).

- **Replacing the NDE bearing**

  - Remove the box lid (48), the cover rear panel (47) and the side panels (367).
  - Disconnect the stator outputs (T1 to T12).
  - Disconnect the auxiliary winding wires AREP (X1,X2,Z1,Z2).
  - Disconnect the exciter wires (5+,6-).
  - Remove the air inlet grille (51).

If using a single-bearing or double-bearing machine without the regreasable bearing option:
- Remove the 8 nuts from the tie rods (36).
- Remove the shield (36).
- Take out the antifriction bearing (70) using a puller with a central screw (see drawing below).

If the machine has the regreasable bearing option, start by removing the screws from the bearing stop (78).

- Fit the new antifriction bearing onto the shaft after heating it by induction to approximately 80 °C.
- Mount the new preloading (wavy) washer (79) + the new “O” ring seal (349) in the shield (36) and coat the bearing seat with adhesive paste.
If using a single-bearing or double-bearing machine with the regreasable bearing option:
- Screw a threaded rod into the thrust bearing (78).
- Refit the end shield on the machine using a dowel and nut in the shaft extension (see drawing).
- Slide the threaded rod into the shield hole to make it easier to assemble (see basic diagram).

- Fit the thrust bearing screws (78), remove the threaded rod, fit the other screw and tighten up the assembly.
- Block the 8 tie rods of the bearing (36).
- Reconnect wires.
- Fit the air inlet grille (51).
- Replace the cover.

**WARNING**

When dismantling the shields, you will need to change the antifriction bearings, the “O” ring seal, the preloading (wavy) washer and adhesive paste.

**Replacing the DE bearing**
- Remove the air inlet grille (51).
- Untighten the tie rods (36).
- Remove the air outlet grille (33).
- Remove the 6 screws from the DE shield (30) and the 3 screws from the inner bearing retainer (68).
- Remove the shield (30).
- Take out the ball bearing (60) using a puller with a central screw.
- Fit the new bearing, after heating it by induction to approximately 80 °C.
- Screw two threaded rods into the thrust bearing.
- Refit the shield (30) on the machine.
- Slide the threaded rod into the shield hole to make it easier to assemble (see basic diagram).
- Tighten the bottom thrust bearing screws, remove the threaded rod and fit the other screws.
- Block the 6 screws of the bearing (30) before locking the tie rods (36).
- Refit the air grille (33) and (51).

**Dismantling the rotor assembly**

Follow the procedure for dismantling the bearings.
- In a single bearing machine:
  • remove the SAE washer as per the front bearing (30) removal procedure,
  • remove the coupling disc (322).
- Rest the rotor on one of its poles.
- Support the DE rotor (4) with a strap or with a support constructed in accordance with the following drawing.
- After extraction of the rotor, be careful not to damage the fan (15).
- Remove the rotor on special V-shaped supports.
When dismantling the rotor involves changing parts or rewinding, the rotor must be rebalanced.

• Reassembling the machine
  - Follow the dismantling procedure in reverse order.
  - Take care not to knock the windings when refitting the rotor in the stator.
  - In a single or dual bearing machine with regreaseable bearing option: apply the regreaseable bearing changing procedure.
  - Block the 6 screws of the front bearing (30)/SAE washer before tightening the tie rods (36).
  - Refit the air grille (33) and (51).

4.7 - Installation and maintenance of the PMG
The PMG reference is PMG 2.
See the PMG manual ref : 4211.

4.8 - Table of characteristics
Table of average values:
Alternator - 4 poles - 50 Hz - Standard winding No. 6 (12-wire) (400V for the excitation values).
The voltage and current values are given for no-load operation and operation at rated load with separate field excitation.
All values are given to within ± 10% and may be changed without prior notification (for exact values, consult the test report).
**LSA 46.3**

Low Voltage Alternator - 4 pole

- **Three-phase: 4-pole**
- **SHUNT/AREP excitation**

### Resistances at 20 °C (Ω)

5.2 - Technical support service
Our technical support service will be pleased to provide any additional information you may require.

For all spare parts orders or technical support requests, send your request to service.epg@leroy-somer.com or your nearest contact, whom you will find at www.lrsm.co/support indicating the complete type of machine, its number and the information indicated on the nameplate.

Part numbers should be identified from the exploded views and their description from the parts list.

To ensure that our products operate correctly and safely, we recommend the use of original manufacturer spare parts.

In the event of failure to comply with this advice, the manufacturer cannot be held responsible for any damage.

After operational testing, it is essential to replace all access panels or covers.

5.3 - Accessories

- Space heater for use when stopped
The space heater must run as soon as the alternator stops. It is installed at the rear of the machine. Its standard power is 250W with 220V or 250W with 110V on request.

Warning: the power supply is present when the machine has stopped.

- Temperature sensors with thermistors (PTC)
These are thermistor triplets with a positive temperature coefficient installed in the stator winding (1 per phase). There can be a maximum of 2 triplets in the winding (at 2 levels: warning and trip) and 1 or 2 thermistors in the shields.
These sensors must be linked to adapted sensing relays (supplied optionally).
Cold resistance of cold thermistor sensors: 100 to 250 Ω per sensor.

- Connection accessories
- 6-wire machines : coupling (F)
- 12-wire machines : coupling (A), (F .F), (F).
5.4 - Exploded view, parts list and tightening torque

• Single-bearing
• Double-bearing

Disposal and recycling instructions
We are committed to limiting the environmental impact of our activity. We continuously monitor our production processes, material sourcing and product design to improve recyclability and minimise our environmental footprint. These instructions are for information purposes only. It is the user’s responsibility to comply with local legislation regarding product disposal and recycling.

Recyclable materials
Our alternators are mainly constructed from iron, steel and copper materials, which can be reclaimed for recycling purposes. These materials can be reclaimed through a combination of manual dismantling, mechanical separation and melting processes. Our technical support department can provide detailed directions on how to dismantle products on request.

Waste & hazardous materials
The following components and materials require special treatment and must be separated from the alternator before the recycling process:
- electronic materials found in the terminal box, including the automatic voltage regulator (198), current transformers (176), interference suppression module (199) and other semi-conductors.
- diode bridge (343) and surge suppressor (347), found on the alternator rotor.
- major plastic components, such as the terminal box structure on some products. These components are usually marked with information concerning the type of plastic.

All materials listed above need special treatment to separate waste from reclaimable materials and should be entrusted to specialist recycling companies.

The oil and grease from the lubrication system should be treated as hazardous waste and must be treated in accordance with local legislation.

Our alternators have a specified lifetime of 20 years. After this period, the operation of the product should be stopped, regardless of its condition. Any further operation after this period will be under the sole responsibility of the user.

Low Voltage Alternator - 4 pole
EC Declaration of compliance and incorporation

This Declaration applies to the generators designed to be incorporated into machines complying with the Machinery Directive Nr 2006/42/EC dated 17 May 2006.

DECLARER:

MOTEURS LEROY-SOMER
Boulevard Marcellin Leroy
16015 Angoulême
France

MLS HOLICE S TLO.SRO
Sladkovskeho 43

France

LEROY-SOMER ELECTRO-TECHNIQUE Co., Ltd.
No1 Aimosheng Road,
Galshan Town,
Cangshan District.
Fuzhou,
Fujian 350026 Chine

DIVISION LEROY-SOMER
Street Emerson
Nº Parcul Industrial Tetarom 2
4000641 Cluj Napoca
Roumanie

Declares hereby that the electric generators of the types:

LSA 40 – LSA 42.3 – LSA 44.3 – LSA 46.3 – LSA 47.2 – LSA 49.1 – LSA 49.3 – LSA 50.1 – LSA 50.2 – LSA 51.2 – LSA 52.2 – LSA 52.3 – LSA 53.1 – LSA 53 – LSA 54 – LSA 54.2 – TAL 040 – TAL 042 – TAL 044 – TAL 046 – TAL 047 – TAL 0473 – TAL 049 – LSAH 443 as well as their derivatives, manufactured by Leroy-Somer or on Leroy-Somer's behalf, comply with the following International Standards and Directive:

- EN and IEC 60034-1, 60034-5 and 60034-22.
- ISO 8528-3 “Reciprocating internal combustion engine driven alternating current generating sets. Part 3. Alternating current generators for generating sets”.

Furthermore, these generators, designed in compliance with the Machine Directive Nr 2006/42/EC, are therefore able to be incorporated into Electrical Gen-Sets complying with the following International Directives:

- EMC Directive Nr 2014/30/EU dated 26 February 2014, as intrinsic levels of emissions and immunity are concerned.

WARNING:
The here mentioned generators should not be commissioned until the corresponding Gen-Sets have been declared in compliance with the Directives Nr 2006/42/EC, 2014/30/EU and 2011/65/EU, as well as with other relevant Directives.

Leroy-Somer undertakes to transmit, in response to a reasoned request by the national authorities, relevant information on the generator.

Technical Managers
J.P. CHARPENTIER  Y. MESSIN

The contractual EC Declaration of compliance and incorporation can be obtained from your contact on request.

Our worldwide service network of over 80 facilities is at your service. This local presence is our guarantee for fast and efficient repair, support and maintenance services.

Trust your alternator maintenance and support to electric power generation experts. Our field personnel are 100% qualified and fully trained to operate in all environments and on all machine types.

We have a deep understanding of alternator operation, providing the best value service to optimise your cost of ownership.
